Friend—"Now that you have made millions, what will you do?" OLD BULLION—"I shall retire, and amuse myself telling people what a burden wealth is, and how happy I was when I was poor."—*N. Y. Weekly.*

P. H. Jackson & Co., manufacturers of structural iron and steel works for buildings, sidewalk lights, and sky lights, etc. If you want to improve some dark corner of your building or have a cosy bright room, made of what is now a dark vault under the sidewalk, call upon these gentlemen and they will show you how it can be done, and what is more, do it in such good shape, that you will thank your stars that you thought of going to their place of business 228 and 230 First street, San Francisco, Cal.

Hotel CLERK—"The old gentlemen in No. 201 says that his room is full of steam from the laundry." PROPRIETOR—"All right. Charge him $1 50 for a Turkish bath."—*N. Y. World.*

The attention of architects and those contemplating to build are called to the advertisement of "The J. L. Mott Iron Works" in this edition. This concern manufacture a large number of different articles of fine sanitary goods for fine residences, as also large buildings, factories, school houses, etc., which are not excelled by any manufacturers in the world. Their Pacific Coast Representative, M. S. James, has on hand all the catalogues and will be pleased to furnish same to any one desiring them, and will give all necessary information that may be desired.

Portland Cements.—This might be called the "Age of Cement" if we judge by the quantity of cement in use in this city, and upon the whole coast in fact, while every day shows an increase in the demand of this article. A word to the wise is enough, therefore we says "Josson" and "North" can always be had by leaving an order with J. W. Grace & Co., 203 California street, San Francisco.

Practical ÆSTHETICS—FRIEND—"Why do you have all your ceilings and walls finished in crimson?" MRS. SUBURB (of New Jersey)—"That's so we can slap mosquitoes without making a splotch."—*N. Y. Weekly.*

Architectural Terra-Cotta.—Messrs. A. Steiger Sons, manufacturers of architectural terra cotta, having their works at San Jose, California, can supply all orders in the way of hollow tile, flue linings, colored bricks, vases, and fire bricks and an almost endless list of terra cotta work that the architects want for safety and adornment. Their office in this city is at 320 Sansome street, room 3, telephone 5253.

"Have you been playing the races?" "No," replied the rejected looking man. "The races have been playing me."—*Washington Starr.*

Fitzgerald Prepared Wall Plaster—We have had occasion before now to call attention to the merits of Fitzgerald Wall Plaster, the steady increase of its use since it was first introduced upon the market, is conclusive that it has come to stay, if you want to know about it call upon the Pacific Patent Plaster Co., 216 Bush street, San Francisco, room 90 Telephone Building, telephone 638.

The SARCASTIC BARNSTORMER (after the bombardment from the gallery)—"I have eggs enough now, thank you. Will no one send up an accompaning ham?" THE GALLERY—"Its on the stage now!"—*Chicago Record.*

Smith & Young, office 723 Market street, San Francisco, 230 South Spring street, Los Angeles. These gentlemen supply almost every thing required in building, from blue prints and paper for making them, to wood carvings; as well as wood ornaments, pressed, Bostwick Steel Lath, painted or unpainted, mineral wool, painted as well as mortar stains, but the list is too long for this notice. See their advertisement on page ix this journal.

"My sympathies," said the effervesing young woman, "are altogether with the dear Japanese." "So are your hired girl's," said the matron. "She believes all china should be eternally smashed."—*Detroit Free Press.*

San Joaquin Brick Co.—This company's works are situated in Stockton, Cal.; the manufacture of fresh water brick is carried on extensively at that point, their San Francisco yard is on Berry street between 6th and 7th, San Francisco; F. W. Muller, President; C. Horton, Secretary; E. H. Burrell, Agent, 408 California street, room 16.

CITY BUILDING NEWS.

Alvarado, lot 21, Heyman Tract. To build; owner, Thos. J. Hume; contractors, H. Plant & W. H. Davis; signed, July 18; filed, July 23; cost $1480.

Beale and Howard. One story brick; owner, W. F. Whittier; architects, Percy & Hamilton; contractor, R. Ringrose; signed, July 10; filed, July 10; cost $7964.

Butte and Texas. To build; owner, Jno. F. Danielson; contractors, Peterson & Person; signed, July 6; filed, July 7; cost $2340.

California and Laguna. Alterations and additions; owner, E. W. Hopkins; architect, Clinton Day; contractor, C. Chisholm; signed, June 26; filed, July 10; cost $2805.

Cole and Page. To build; owner, Frank Dickson; architects, Wright & Sanders; contractor, James Geary; signed, July 2; filed, July 16; cost $4025.

Clipp r near Noe. To build; owner, C. H. Wescott; contractors, J. W. Mullin and J. H. Rothgeber; signed, June 29; filed, July 20; cost $1500.

Clay near Cherry. To build; owners, L. H. Nagel and wife; architect, W. H. Lillie; contractor, W. H. Kennedy; signed, July 20; filed, July 21; cost $1600.

Cole near Carl. Two-story frame; owner, Minna Stettin; architect, Emile John; contractors, Schutt & Kraecker; signed, July 12; filed, July 26; cost $3000.

Dolores near 24th. Moving and additions, etc.; owner, J. B. Davis; architect, J. C. Newsom; contractor, B. B. Williams; signed, July 14; filed, July 24; cost $1691.

Engine House No. 4. Alterations, etc.; owner, City and County of San Francisco; contractor, J. B. Burk; cost $2450.

Engine House No. 5. Alterations, etc.; owner, City and County of San Francisco; contractor, Alex L. Campbell; cost $2193.

Engine House No. 12. Alterations, etc.; owner, City and County of San Francisco; contractor, Alex. L. Campbell; cost $1526.

Engine House No. 13. Alterations, etc.; owner, City and County of San Francisco; contractor, Alex. L. Campbell; cost $1277.

Engine House No. 7. A brick building; owner, City and County of San Francisco contractor, James Campbell; cost $8590.

Engine House No. 26. A brick building; owner, City and county of San Francisco; contractor, Jas. Campbell; cost $9985.

Eight Ave. near California. To build; owner, A. Seip; architect, A. J. Barnett; contractor, A. L. Jackson; signed, July 30; filed, July 30; cost $1574.

Fell near Fillmore. Plumbing two-story frame; owner, A. C. Freese and wife; architect, T. J. Welsch; contractor, J. E. Britt; signed, July 11; filed, July 14; cost $1220.

Fell near Fillmore. Carpenter work; owners, A. C. Freese and wife; architect, T. J. Welsh; contractors, G. Petersen & A. Olson; signed, July 11; filed, July 14; cost $8750.

Fulton near Lott. To build; owner, M. A. Martin; contractor, A. Winberg; signed, July 23; filed, July 23; cost $2700.

Fillmore near Pine. To build; owner, John Hughes; architect, Chas. I. Havens; contractor, Brennan Bros.; signed, June 28; filed, June 28; cost $12,618.

Fifth near Clara. Second story addition; owner, Geo. Alpers; architect, Jno. J. Clark; contractor, H. Barn; signed, July 31; filed, Aug. 1; cost $1000.

Glover near Leavenworth. Alterations; owner, A. Stanner; contractor, H. S. Grieb; signed, July 28; filed, July 30; cost $1050.

Green near Dupont. To build; owner, Joseph Recca; architect, T. J. Welsh; contractor, G. Masoletti; signed, July 24; filed, July 26. cost $2000.

Guerrero near 25th. To build; owner, W. J. Handy; architect, A. C. Lutgens; contractor, Joseph Kemp; signed, July 21; filed, July 24; cost $3480.

Harrison near Caroline. To build; owner, J. H. Hudges; architect, A. C. Lutgens; contractor, H. Munster; signed, July 9; filed, July 9; cost $1755.

Hampshire near 22d. Alterations and additions; owner, Margaret Gallagher; contractor, Victor Godin; signed, June 14; filed, July 14; cost $980.

Hayes near Buchanan. To build; owner, Godfrey Smith; contractors, Peterson & Person; signed, June 29; filed, June 30; cost $1110.

Isis near 18th. To build; owner, Claus Wohltmann; contractor, R. B. Hicks; signed, July 2; filed July 5; cost $2450.

Jackson near Scott. Brick work; owner, A. K. Gibbs; contractors, McGowan & Butler; signed, June 27; filed, July 10; cost $1575.50.

Jackson near Scott. Granite work; owner, A. K. Gibbs; contractor, James Roe; signed, June 28; filed, July 11; cost $1020.

Jackson near Scott. Plumbing; owner, A. K. Gibbs; contractors, Duffey Bros.; signed, June 29; filed July 11; cost $2830.

Jackson near Scott. Cut stone work; owner, A. K. Gibbs; contractor, Jno. D. Metgilvray; signed, June 29; filed, July 11; cost $5637.

Jackson near Scott. Roof tiling; owner, A. K. Gibbs; contractors, Gladding, McBean & Co.; signed, June 26; filed, July 12; cost $2450.

Jackson near Scott. Glass and carpenter work; owner, A. K. Gibbs; contractors, Wm. Knowles & Geo. Reichley; signed, July 11; filed, July 13; cost $4541.

Juri and San Jose Ave. To build; owner, Louis Juri; architect, John I. Kidd; contractor, Chas. M Depew; signed, July 14; filed, July 16; cost $4580.

Kentucky near Sierra Nevada. To build; owner, P. O'Farrell; architect, J. E. Wolf; contractor, C. J. Autwiler; signed, July 13; filed, Aug. 4; cost $1987.50.

Larkin near Pine. Two separate tenements; owner, C. S. Blair; contractor, Wm. Plant; signed, July 24; filed, July 24; cost $3061.

Market near Geary. Repairs of the Golden Rule Bazaar; owners, Davis Bros.; contractor, Geo. H. Walker; signed, June 29; filed, July 2; cost $3800.

Market near 8th. Brick work; owner, Geo. Moffatt by Ext.; architect, C. R. Wilson; contractor, Robt. Boyd; signed, June 5; filed, July 5; cost $5475.

Market near 8th. Carpenter work; owner, Geo. Moffatt Ex.; architect, Chas. R. Wilson; contractor, James J. O'Brien; signed, June 5; filed, July 5; cost $9850.

Market near 8th. Iron work; owner, Geo. Moffatt Ex.; architect, C. R. Wilson; contractor, H. Ralston; signed, June 5; filed, July 5; cost $2315.

Market near 5th. Sand stone work for 4, 5, 6 and 7 stories; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, J. D. McGilvay; signed, June 8; filed, July 26; cost $53,645.

Market near 5th. Sandstone work, 1, 2, 4 stories; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, J. D. McGilvray; signed, June 6; filed, 6; cost $51,355.

Ninth Ave. near California. To build; owner, Ella A. McNear; architect, F. E. McNear; contractor, Geo; L. Paff; signed, July 13; filed, July 16; cost $2900.

Nineteenth near Noe. Two flats; owner, Jos. H. Robinson; architect, A. W. McQueen; contractor, Jos. Drolette; signed, July 20; filed, July 25; cost $3000.

No location given. To build; owner, Wm. Muller; architect, T. J. Welsh; contractor, A. Hawkins; signed, Aug. 1; filed, Aug. 6; cost $6300.

No location given. To build; owner, J. Jacobs; contractor, I. H. Pauls; signed, July 16; filed, July 26; cost $8940.

O'Farrell near Mason. To build; owners, Annie Martin, J. C. & J. H. McGovern and M. McG. Riddell; contractor, Wm. Little; signed, July 16; filed, Aug. 1; cost $6250.

Pine and Mason. Altering stable; owner, S. F. Art Association; architect, A. Page Brown; contractor, I. R. Wilcox; cost $7000.

Pine near Larkin. To build; owners, Japanese M. E. Church; contractor, J. S. W. Sounders; signed, July 27; filed, July 31; cost $6475.

Pleasant near Jones. Two flats; owner, Julia Jones; architect, W. H. Lillie; contractor, W. H. Wiekersham; signed, July 24; filed, July 25; cost $3084.

Polk near Filbert. To build; owner, D. Depaoli; contractor, J. L. McLaughlin; filed, July 28; cost $1230.

Powell near Greenwich. To build; owners, Sarah J. and H. Harris; architect W. H. Armitage; contractors, Stoker & Bunce; signed, July 24; filed, July 31 cost $3500.

Point Lobos Ave. bet 5th and 6th Aves. Concrete and stone, etc.; owners, French Hospital Association; architect, Emile Deplerre; contractor, A. Warner; signed, July 24; filed, July 31; cost $1885.

Sacramento and Laurel. Five frame buildings; owner, Chas. Clarke; contractor, Casper Zwierlein; signed, July 25; filed, July 26; cost $7917.

Sacramento near Baker. Heating and ventilating; owners, California State Hospital; architects, Wright & Sanders; contractors, A. Baumsteiger & Co.; signed, July 24; filed, July 31; cost $4750.

Sacramento near Baker. To build; owner, California State Womans Hospital; architects, Wright & Sanders; contractor, James Geary; signed, June 28; filed, July 5; cost $14,300.

Second Ave. near Pt. Lobos Ave. To build; owner, Mary Dunphy; architect, W. H. Wharff; contractor, F. W. Maurice; signed, June 30; filed, June 30; cost $1460.

Stockton near Pacific. To build; owner, S. Granucci; architect, Chas. R. Wilson contractor, J. J. O'Brien; signed, June 29; filed, June 30; cost $5350.

Sixth near Berry. Refrigerating room etc.; owner, The Pabst Brewing Co. of Milwaukee; architect, H. Geilfuss; contractors, Schutt & Kraeker; signed, July 3; filed, July 5; cost $2676.

Shotwell near 28th; All work; owner, Jno. F. Schomer; architects, Martens & Coffey; contractor, J. Bucher; signed, July 11; filed, July 12; cost $2675.

Seventh and Jessie. Brick building and alterations; owner, Jeremiah Noonan; architect, A. J. Barnett; contractor, J. A. McNeil; signed, July 19; filed, July 21; cost $5000.

Sharon near 16th. Carpenter, paint, mill, etc.; owner, Alexander Black; architect, J. T. Kidd; contractor, Geo. Welsmann; signed, July 12; filed, July 23; cost $1025.

Taylor near Filbert. Three-story frame; owner, John McFadden; architect, Chas. M. Rousseau; contractor, Jas. Glackin; signed, July 18; filed, July 19; cost $4480.

Truck House No. 2. Alterations, etc.; owner, City and County of San Francisco; contractor, A. McElroy; cost $1976.

Twelfth Ave. near Clement. Frame Cottage; owner, Robt. Hazelett; architects Shea & Shea; signed, July 19; filed, July 23; cost $1775.

Washington street. Work on Gymnasium; owner, E. B. Spalding; architect Wm. Curlett; contractor, P. Rive; signed, July 20; filed, July 24; cost $1275.

ARCHITECTS are as a class the worst protected people in the community. Their genius and ability is considered fair game by the majority of the people with whom they come in contact. This is not always the result of total depravity, but simply from a want of thought and a forgetfulness of the Golden Rule, and very often from a want of explicit explanation on the part of the architect of his position. In fact the architects themselves, instead of the public, are most to blame for this state of affairs. Let every architect insist on a written contract before doing any work, and refuse to do any work for nothing, except in a case of charity, and the matter is at once clinched. Verbal orders are always liable to misconstruction.

In architecture, unlike most businesses, there is no visible object by which people who wish a design may judge whether the result of an architect's labor will suit or not. When a person buys furniture, a garment, or a ready-made house, he has something tangible from which to select. You will find generally that a purchaser will visit several shops to see where he may be best suited. Now this idea he carries into the realm of architecture and when he wants to build something and get plans therefor, he considers that sundry different ideas should be presented to him by sundry different architects for his inspection in the same manner as a tradesman exhibits the articles he has for sale—forgetting that the tradesman has already his wares in stock—and all that he loses, if not bought from, is his time in showing the goods, which, to be sure, is bad enough. But the case of an architect is entirely different, he has to set to work and make these several sketch plans out of his brain, and paper and pencil—and these, if rejected are useless to him afterwards, while in the first case if a visitor does not buy from a tradesman he still has the article left for sale to somebody else.

This idea of the general public, the architect has to combat in nearly all cases, and it is very difficult to make a person believe that he ought to pay for something he has no use for and rejected; and here is where a protective society for architects would come in, to disseminate counter ideas to the generally received one, to discountenance any architect who seeks to gain an advantage over his fellows by encouraging this idea, and if after a client has been previously informed of the necessity of returning some collateral for the labor of preparing sketches for his choice, he should refuse

to do justice in the premises, to follow him with the Arm of the Law to see that he does.

This co-operation is more important among architects than others for the very reason that the opportunity of defrauding them of their just dues is greater than in the generality of business.

In Europe and in the East there exists societies for the mutual protection of their members from the rapacity of unjust people by means of helping each other in legal fights to maintain their rights, and if such were established here and a few of these fights gained, it will come to be understood that the work of an architect has some value, even if not used, and that consultations with architects are always of value to the consultor in adding to his stock of knowledge, although of no immediate practical benefit, and consultors will be more willing to pay for the time of the consultees.

THE idea that a complete building can be formed from the combination of the designs of two different architects, especially when of two different schools, although prevalent among the uninitiated, is altogether against the opinion of those who know whereof they speak—and it is against the canons of good taste in all the senses of the word to tag on an entirely different feature to a conception worked out on different lines. In general a private owner sees this and keeps within the bounds of ordinary circumspection; but public buildings seem fair game for all manner of experiments and incongruities. Pity it is so, but so it seems to be.

A THREATENED OUTRAGE.

APPARENTLY our Postoffice site job is going to be capped by the construction of an architectural monstrosity, says the *Examiner*. The Supervising Architect of the Treasury refuses to allow the public to see the plans for the new building upon which millions are to be expended by the taxpayers of the country, on the ground that there would be criticisms which would make trouble by necessitating changes. Of course that means that the plans are not fit to bear public inspection.

We have feared this from the start, and we expressed are fears some months ago. The office of the Supervising Architect of the Treasury is a machine-shop, in which designs are ground out like boards from a sawmill. The Supervising Architect himself, by the very conditions of his service, is necessarily incompetent. The character of the his work moves every intelligent architect in the country to language unfit for publication. His Government building at the World's Fair was one of the two great blemishes of the exhibition, the other being the remaining conspicuous example of political architecture—the monstrosity erected by the State of Illinois. Recognizing the deficiencies of his office in artistic matters, Congress passed a law authorizing the Government to avail itself of private talent in the construction of important public buildings. This law was nullified by the Treasury Department, which insulted the architects who had made the World's Fair a vision of beauty, and expressed its complete satisfaction with the work of its official design factory. Consequently the country is doomed to go on paying the price of palaces for the contempt of the artistic world until Congress takes more peremptory action.

Such action should certainly be insisted upon in the San Francisco case. We have waited long enough for our Postoffice to be able to wait a little longer. For a building that is to be one of the chief architectural monuments of the city we have a right to demand a decent design, and if the official Architect Laureate of the Treasury cannot give it to us, as he probable cannot, we have a right to get it outside. Congress should make an appropriation for the building at its nxet session, and should insert a proviso requiring the work of preparing plans to be thrown open to the qualified architects of the country. It is the duty of our delegation to keep up a disturbance until this is accomplished.

SIXTH ANNUAL COMPETITION FOR THE ROBERT CLARK TESTIMONIAL.

UNDER THE AUSPICES OF THE CHICAGO ARCHITECTURAL SKETCH CLUB OF CHICAGO.

CONDITIONS—The competition is open to architectural draughtsmen under thirty years of age, residents of the United States, and not practicing architects.

The author of each design must execute all drawings without assistance, and non-adherence to these conditions will cause the rejection of the design or designs in question.

The awards will be made by the Adjudicating Committee on the "Robert Clark Testimonial" competition, and are—

First Prize—Gold Medal. Second Prize—Silver Medal Third Prize—Bronze Medal.

Those designs receiving Honorable Mention will receive special Bronze Medals.

The prize drawings are to become the property of the Chicago Architectural Sketch Club.

PROGRAMME.

A design for the facade of an "Art Club" House in a Classic or Cenaissance style, the building to be situated on a residence boulevard.

The building shall be 80 feet in width, situated on a lot 100 feet in width and at a distance of 25 feet from the inside line of the sidewalk. The lot is not situated on a corner, and little or no attention is to be paid to the sides of the building, beyond indicating the proper return of the corhice, etc., in the respective.

The rooms which require expression and which take their light from this front are—

FIRST STORY—An entrance located in the centre and a single room on either side, to be used as Reception and Reading Rooms.

SECOND STORY—A large Banquet Hall located in the centre, and a small unimportant room on either side, which can be lighted from the front or from the sides at the discretion of the competitor.

THIRD STORY—The third story is devoted to bed-rooms, to be arranged at will.

The drawings required are an elevation, at a scale of ¼ of an inch to a foot, rendered in line with pen and ink without shadows or other embellishments, and a perspective rendered at will. They are to be mounted upon stretchers of heavy card-board 29x40 inches, and must be marked with a device or nom de plume. An envelope marked in a similar manner, and containing the name and full address of the author, with place and date of birth, must accompany each design.

Drawings must be delivered to John Robert Dillon, Secretary, Chicago Architectural Sketch Club, at the Club House, 274 Michigan Ave., Chicago, on or before Thursday, November 15th, 1894, charges to be prepaid. All drawings not receiving prizes will be returned at the expense of the contributor.

The Adjudicating Committee on the "Robert Clark Testimonial": W. B. WUNDIE, Chairman. FRANK L. WRIGHT. IRVING K. POUND.

IMPORTANCE OF SLOW BURNING CONSTRUCTION FOR BUILDINGS.

THE August number of the *Engineering Magazine* contains an excellent article by Mr. Edward Atkinson, on the enormous losses by fire, the results of ignorance, stupidity and neglect. He says:

There are no more perfect examples of the art of combustible architecture than are to be found in most of the hospitals, asylums, college buildings and school houses. He has been called upon to inspect more dangerous and unsuitable buildings than some of the larger hospitals, especially one for the insane, which he was once asked to protect as far as he could. The power of invention had been exhausted in making that building unsafe and unfit for its use, and that has been the common rule rather than the exception down to a very recent period. He does not insist upon an absolute fireproof construction of all buildings, as that would be impracticable, owing to the heavy costs; but he strongly advocates a better use of ordinary building materials, whereby the fire cannot so rapidly spread, thus giving time for extinguishment.

For instance, wherever the mill floor, suitably constructed of three inch planks, grooved and splined, covered with one inch top boarding, laid on timbers eight or ten feet on centers, has been made continuous—that is to say, without any break for belt holes, open elevators, or open stairways—it has never been burned through by fire upon the floor or by fire passing through the floor above, except in one instance, and that was a warehouse where a pile of jute bales took fire in a place where it could not be reached. The firemen then put water through the hole from open butts and drowned it out. Fires on such mill floors have been held, not only in the building, but in the room where they originated.

Again, iron posts have been crippled or sprung by heat a great many times at an early period in a fire. A wooden post of suitable size has never burned off until other parts of the building were already destroyed. They have in one instance resisted for hours fire which destroyed granite posts near them by reducing them to sand—the granite measuring 12x12 inches. In this instance oak posts were put in between the original posts of granite to bear an added weight of machinery. When the fire came, the oak sustained the whole load.

To repeat, the mill floor properly constructed and rightly guarded has sufficed to hold fires not only in the building but in the room in which they have originated, until the mill fire department or the public fire department could extinguish the fire. The wooden mill post of suitable size will last longer than the floor. The mill floor possesses this very great advantage over the ordinary joisted floor: fires may be readily swept away between the timbers either by sprinklers or by water from hose pipes; while in the joisted floor or floor laid over plank on edge 18 inches to 24 inches apart on centers, the fire will burn on one side of the joist or plank while the water is playing on the other side.

WHAT MILL CONSTRUCTION IS.

I. Mill construction consists in so disposing the timber and plank in heavy solid masses as to expose the smallest number of corners or ignitable projections to fire, to the end also that when fire occurs it may be most readily reached by water from sprinklers or hose.

II. It consists in separating every floor from every other floor by incombustible stops—by automatic hatchways, by increasing stairways either in brick or other incombustible partitions—to the end that a fire shall be retarded in passing from floor to floor to the utmost that is consistent with the use of wood or any material in construction that is not absolutely fireproof.

III. It consists in guarding the ceilings over all specially hazardous stock or processes with plastering laid on wire lath or upon dovetailed lath or by plaster board of a suitable kind, following the lines of the ceiling and of the timbers without any interspaces between the plastering and the wood; or else in protecting ceilings over hazardous places with tin or other suitable metal, but not with zinc.

IV. It consists not only in so constructing the mill, workshop, or warehouse that fire shall pass as slowly as possible from one part of the building to another, but also in providing all suitable safeguards against fire.

V. It consists in laying the top floor and the outer boarding of the roof over mortar, plaster board, or some other fire retardent between it and the plank, where the maximum of safety is to be attained.

WHAT MILL CONSTRUCTION IS NOT.

I. Mill construction does not consist in disposing a given quantity of materials so that the whole interior of a building becomes a series of wooden cells; being filled with concealed spaces, either directly connected each with the other or by cracks through which fire may freely pass where it cannot be reached by water. That is the common practice now named "combustible architecture."

II. It does not consist in an open timber construction of floors and roof resembling mill construction, but of light and insufficient size in timbers and thin planks, without fire stops or fire guards from floor to floor.

III. It does not consist in connecting floor with floor by combustible wooden stairways incased in wood.

IV. It does not consist in putting in very numerous divisions or partitions of light wood.

V. It does not consist in sheathing brick walls with wood, especially when the wood is set off from the wall by furring, even if there are stops behind the furring.

VI. It does not consist in permitting the use of varnish upon wood work over which a fire will pass with the speed of a race horse.

VII. It does not consist in leaving windows exposed to adjacent buildings unguarded by fire shutters.

VIII. It does not consist in permitting the storage of very combustible goods without protecting the ceilings with solid plastering, plaster board, or metal.

IX. It does not consist in leaving even the best constructed building in which dangerous occupations are followed without automatic sprinklers and without a complete and adequate equipment of pumps, pipes and hydrants.

X. It does not consist in using any more wood in finishing the building after the floors and roof are laid than is absolutely necessary, there being now many safe methods available at low cost for finishing walls and constructing partitions with slow burning or incombustible material.

The importance of these suggestions will be understood if we reflect for a moment upon the vast aggregate of property values annually destroyed by fire. Mr. Atkinson says:

The waste of property by fire is increasing year by year, in undue proportion to the increase of property at risk. Last year's ash heap in the United States has been computed in excess of $150,000,000. In order to ascertain the true measure of the fire tax we must add to this some $60,000,000 to $70,000,000 as the cost of sustaining insur-

ance companies, by which a part of the loss is distributed throughout the cummunity. To this again must be added the cost of sustaining fire departments, which came to $25,0000,000 some years ago, when I first investigated this subject. Thus the measure of this fire tax in the past year cannot have been less than $250,000,000. That is the penalty which we pay for ignorance, stupidity, carelessness and crime, for which the responsibility must be distributed mainly among owners of buildings, though shared in part by occupants, architects and builders.

THE GODWIN BURSARY REPORT, 1893.

MR. Banister F. Fletcher's Report as Holder of the Godwin Bursary* for 1893.

SECTION I. briefly recounts the preliminaries in regard to the question of site, and the composition and functions of the Commission appointed to carry out the general arrangements of the Exhibition, and goes on to tell how the boundless marshy waste chosen for the site, consisting of a succession of low sand dunes situate on the shore of an inland sea, was turned to the best and most effective use by the eminent "landscape architect," Mr. Olmstead, to whom was entrusted the laying-out of the grounds. In an interview with Mr. Olmstead the author gained much information about this part of the undertaking, which is duly retailed in the Report.

The question of procuring designs for the great buildings was a problem not a little difficult of solution, and many any various were the suggestions offered. At length a Council of Architects was decided upon, who sinking personal idiosyncrasies, agreed to work together for the benefit of the whole scheme. It was fortunate, remarks the author, that at the head of this Council was placed by mutual consent Mr. Richard Morris Hunt (*Royal Gold Medallist* 1893), who is looked up to as the Nestor of the architectural profession in the States, and who exercised a controlling influence over the other members of the Council; and more fortunate still that the architects of the buildings surrounding the great court were all pupils or direct followers of Mr. Hunt. Mr. Post and Mr. Van Brunt were pupils; Messrs. Howe, Peabody and Stearns had been pupils of Mr. Van Brunt; and Mr. McKim, by his training at the Ecole-des-Beaux-Arts, was of the same school of thought and design. Harmony was thus assured, with a result the more satisfactory to architects because it led to what was practically an exhibition of architecture. True, the expression of American life in the art was not to be found, but this can be forgiven in the face of the object-lesson afforded of the accepted canons of architectural art with respect to proportion, and its union with sculpture and painting, and those points which are apt to be overlooked in a new country. Nevertheless, the reproduction of these great classic designs all over the country for town-halls, museums and the like is strongly deprecated; it is sufficient that American architects, who are already advancing so rapidly along certain new lines of departure, should profit by the lessons such designs teach, without lavishly copying the forms. Otherwise a great "classic revival" will result, and stay for a prolonged period the true progress of art in America. Section I. concludes with a tabular statement showing the extent of area covered, and statistics as to the number of exhibitors, attendance, receipts, cost, etc., of all the principal exhibitions since that held in London in 1851.

SECTION II., The Great Buildings, commences with a list of the principal buildings, and gives the area occupied, cost, dimensions, and names of the architects who designed and superintended their construction. The largest of all, the Manufactures Building, measured 1,687 by 787 feet, and cost £200,000; the most expensive, costing £240,000 with the annex, being the Machinery Hall, the dimensions of which were 846 by 492 feet. A few features common to all the buildings may usefully be noted.

The enclosing walls were built of a framework of wood, properly braced, and sheathed on front and back with boarding laid diagonally, to which was fixed the exterior facing of "staff"—a material the composition and mode of preparation of which are given in the Report. All the statuary and ornamentation, such as caps, pilasters, etc., were formed of this material, which can be sawn, planed and tongued like wood, and if painted, and the weather kept from penetrating behind the face, will last, it is said, as long as wood. Mr. Fletcher gives as well the recipe for making the paint used on the exterior of the buildings. This consisis of varying proportions of rice-flour, bicarbonate of soda, linseed oil, water, and table salt; and besides being considerably cheaper is much more satisfactory than ordinary oil-paint for brick, cement or plaster.

The foundations of the buildings were constructed entirely of plank. The load on the soil for spread foundations was 2,500 lbs. per square foot, and a maximum load of fifteen tons per pile where piling was used. As the soil was almost entirely sand, and the subsoil either clay or sand, the spread foundations were put right on top of the sand. The main floors of all the buildings, except the Machinery Hall and the Mines Building, were figured for 200 lbs. per square foot. The Machinery Hall was figured for 250 lbs., and the Mines Building for 150 lbs. The galleries were figured for 80 lbs. per square foot, except those used for restaurants, which were figured for 100 lbs. The roof trusses were figured for 40 lbs. per horizontal foot, or 25 lbs. vertical load and 30 lbs. wind pressure. Purlins and jack rafters were figured for 30 lbs. per horizontal foot. The unite and fibre strains were as follows:—

Tension: steel 20,000 lbs., iron 11,000 lbs. per square inch.
Compression: steel 15,000 lbs., iron 10,000 lbs., reduced by formula, per square inch.
25,000 lbs. fibre strain was allowed in steel pins, and 20,000 lbs. in iron pins.
Steel pins, bearing, 20,000 lbs., iron 15,000 lbs.
Steel rivets, 20,000 lbs. bearing, 10,000 lbs. shear.
Iron rivets, 15,000 lbs. bearing, 7,500 lbs. shear.
Wood, fibre strain, white pine, 1,200 lbs. maximum.
Bearing perpendicular to fibre, 300 lbs.; shear with grain 100 lbs.; maximum bearing at end of timber 800 lbs.; tension 800 lbs. to 1,000 lbs.

The wooden framework was a novel construction never before attempted on so large a scale; and it is interesting to note the methods employed to keep within the architectural lines of the design all the constructive necessities. The upright posts as a rule were six inches by six inches, braced with cross-bracing and nailed with round nails of great holding power, put up without any framing out of stock sizes of lumber. Stock sizes were used so that the framework might be sold as salvage at the close of the Exhibition. This box construction was then sheathed with rough boarding laid diagonally, and the "staff" nailed to the sheathing. Where extra strength was required the framing was double sheathed, on the inside as well as the outside, the sheathing being reversed for extra strength. In the case of height exceeding a certain length, horizontal ties were added, and from this platform the framing started afresh. The sheathing was well nailed to each stud-post, and at least one half of the boards were continuous over plate, and everywhere broke joint. Plates 30 feet long or under were made in pieces in one length, plates over that length being formed of two or three pieces breaking joint, at least 10 feet apart, spiked with ten spikes per running foot. Sheathing on all plates was on two sides diagonally in opposite directions nailed with ten nails per running foot. Rain water pipes were of corrugated iron.

From an architectural point of view the Agricultural

* The Godwin Bursary, consisting of a Silver Medal and £40, was founded for the promotion of the study of works of Modern Architecture Abroad, and is awarded to any member of the profession who shall submit the best selection of practical working drawings, or other evidence of special practical knowledge, and testimonials. The holder of the Bursary is required to spend not less than five weeks abroad, in Europe or America, to study, examine, and report on some of the best specimens of modern planning and modes of construction, drainage, water-supply, ventilation, and other sanitary arrangements to be found in the place he undertakes to visit. Within a given time he must furnish the Council with an illustrated memoir descriptive of the same.

† Mr. Fletcher left England for New York on the 17th of May, 1893, and visited Brooklyn, Philadelphia, Baltimore, Washington, Chicago, where he spent five weeks, Niagara, Montreal, Boston, and back to New York, returning to England in the middle of August.

Building was the finest, owing to the union of architecture with painting and sculpture. The latter was most unsparingly applied, and might be considered almost a dream in "staff," presenting a composition which, owing to the expense, it would be impossible to render in any lasting material.

From a constructional point of view, the steel centilever trusses of the great nave and aisles of the Mines Building by Mr. S. S. Beman were exceedingly interesting and novel. The central space to be roofed was 630 feet long and 230 feet wide, with an extreme height of 100 feet at the centre, and 47 feet at the sides. Steel cantilever roof trusses, supported on steel stancheons, were placed 64 feet 5½ inches apart longitudinally, with a span of 115 feet, and aisles on either side of 57 feet 6 inches span. The total area, therefore, of 630 feet by 230 feet was carried on sixteen supporting stanchions.

As a color scheme the Transportation Building was probably more important than any erected in recent years, from the simple fact that it was designed from the commencement for color treatment. Mr. Sullivan, one of the architects responsible for the building, is an enthusiastic botanist, and all his system of sculptured as well as color work is derived from a study of practical botany.

The method of designing the sculpture on the Fisheries Building is interesting. A full-size drawer was first made of old Romanesque capitals, and this was taken to the sculptor's studio, and there worked over with representations of animals real or mythological, such as frogs, reptiles, various kinds of fish, dolphins, etc., The outline of the old cap was retained, and the detail filled in with various things connected with the sea. A variety of caps was thus produced, which could be easily cast in "staff" and duplicated throughout the building.

SECTION III. The States Buildings.—The pages comprising this section are devoted to the more important buildings erected at the expense of the different States of the Union. In regard to methods of construction there was nothing very novel to report, and in general the buildings were treated without any regard to each other or to grouping, their design being determined by associations connected with the founding and historical development of each State, thus affording opportunity of introducing many interesting features. Many of the buildings ranked highly as designs, and all were interesting as illustrative of the manners and resources of the various States, and the enormous and varied wealth of the country in building materials.

SECTION IV. The Constructive Exhibits.—In this section a short account is given of the more noteworthy exhibits connected with methods of construction, and of materials such as building stone, bricks, tiles, etc. The fireproof partition walls formed of hollow tiles varying in thickness from two to six inches, now so general in the States, are a great improvement on the old 6-inch lath-and-plaster partitions ordinarily used in England. The skin of the tiles is half an inch in thickness, and is left rough on the face for receiving the plaster. The tiles are laid one over the other to break joint, and are further secured longitudinally by iron clips, wood bricks being set in the vertical and horizontal joints to affording nailing surface for the architraves, wainscoting, etc. The hollow tiles allow the introduction of flues for ventilating, heating, etc., and gas and gas-pipes, electric wires, etc. Outer walls are also constructed of these tiles.

Steel is used largely for constructive purposes, and some novel exhibits were shown in the way of steel roofing and steel ceilings and wainscoting. The roofing is prepared in sheets and painted with graphite paint. It costs 14*s* per hundred square feet, and 20*s* for laying. The thin plates of steel used for ceilings are designed to supercede ordinary plaster ceilings; they can be pressed out to any pattern, and it is claimed for them that they are fire-and-water proof, permanent, will not skrink, burn, warp, crack, or fall like plaster. They can be applied over old plaster ceilings. For rough wear in large halls or schools the steel wainscoting would be of service. The Ransome concrete inventions formed an important exhibit; they are applicable to various constructions, especially for floors and foundations, allowing of the distribution of a great weight over a large area without sacrifice of height. An explanation of the principles which guided the inventor is given in the Report.

SECTION V. The Sanitary Exhibits.—The various forms of drain traps and w.-c. apparatus exhibited are described in this section, and attention drawn to anything novel in their application. The ambitious scheme formulated for the Hygiene and Sanitation Bureau by Dr. Brewer, the Superintendent of this department, unfortunately fell through from want of support by the Exhibition authorities; hence the opportunity was lost of making the department, what it might and should have been, the most complete of its kind. Dr. Brewer's original proposals were for a most comprehensive scheme, the details of which are set out in a prospectus inserted in the Report.

SECTION VI. Heating and Ventilation.—Some interesting and useful notes are given in this section culled from a pamphlet on the Heating and Ventilation of Residences, by Mr. James R. Willett, being an address delivered by him to the Engineering Society of the Illinois University. The work has since been presented to the Library by Mr. Fletcher, who states that the information contained therein, based as it is upon the practical experience of a practising architect, will be found very useful. With regard to the methods of ventilation adopted in the States, the disc fans seem to be most favored, and it is surprising they should be so little known in England. Several kinds were exhibited, the chief advantages consisting in the quantity of air set in motion, the small power required to work the apparatus, the adjustibility of the blades, its easy removal to any part of the room, and its noiselessness.

SECTION VII. The Institute of Building Arts.—This is a permanent exhibition in the city of Chicago of every class of building materials, systematically arranged, and under the care of a responsible curator. The Institution is under the control of the Illinois chapter of the Institute of Architects, and bears the same relation to the constructive arts generally as the Parkes Museum does to sanitation and hygiene. Anything new in methods of construction or materials is here exhibited, with incalculable advantage to architect, client and builder, who may compare and select at will. Such an institution, suggests Mr. Fletcher, started under the auspices of the R. I. B. A., under the control say, of the Practice Committee, would be of the greatest service to the profession in England. Under proper management and under one roof all new methods could be judged by periodical visits, saving much time and trouble in single investigations. The income of the institution under notice is derived from a nominal annual charge for exhibit space, amounting to five dollars per superficial foot per annum. The institution is free to the public, and information given gratuitously; materials are tested free of charge, and lectures delivered on special subjects connected with the exhibition. That the institution is popular may be judged from the fact that it is visited on an average by over 1,500 persons monthly.

SECTION VIII., IX., X. Specifications and Contract Drawings of Buildings.—Through the courtesy of Mr. D. H. Burnham, the chief of Construction to the Exhibition, Mr. Fletcher was able to include in his Report a selection of the specifications prepared for the erection or completion of the various portions of different buildings in the grounds.—*Journal of the Royal Institute of British Architects.*

A DEMAND FOR A TELEPHONE.

"DOWN in Texas," says an electrical salesman, in *Electrical Review*, "I think there is a good demand for a telephone that can talk over 100 miles of barbed wire fence. On the ranches cowboys are kept 'riding the fence,' that is, riding up and down a section of barbed wire fence, inspecting it and keeping it in order. Many ranches are twenty, thirty and fifty miles square, and if a serious break in a fence is found, the cowboy must ride back to the ranch to report. Now if a good telephone could be provided for each section it would save all that riding. The staples holding the two top wires to the posts could be removed, insulators put in their places and a man would have a complete metallic telephone circuit around his ranch."

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

COMPETITIVE design for a State Capitol building to be erected in the city of Olympia, State of Washington, Copeland & Pierce and W. O. Banks, associated architects, San Francisco.

OAKLAND High School, second mention, J. C. Newsom, Architect. Rejected on account of cost.

CORRESPONDENCE

To the Editor of the California Architect and Building News.

DEAR SIR:—In a recent issue of your paper we notice in Mr. Ernest L. Ransome's letter of June 19, 1894, the following paragraph:

"Take any face brick made on the Pacific Coast, heat it to redness and plunge it into cold water and it will go to pieces. Fire brick, even, often suffers under such a test."

Replying to this we would say that within a month we have made very thorough tests of our face or pressed and fire brick.

The most thorough test made was of two buff pressed brick. Each of these were heated to a red heat five separate times, and after each heat they were put into cold water and remained there until perfectly cool.

With the exception of a slight discoloration, these brick are in just as good condition as they were before they were subjected to this test. We have also made similar tests of our fire brick and they have not gone to pieces as Mr. Ramsome predicted they would. The brick that we subjected to these tests are now in our office on exhibition and can be seen by anybody interested in such matters.

Yours respectfully,

GLADDING, MCBEAN & CO.

NOTICE—PLANS AND SPECIFICATIONS FOR A SCHOOL-HOUSE.

By order of the Board of Trustees of Santa Cruz School District, Santa Cruz County, State of California, notice is hereby given that plans and specifications in detail will be received up to 12 o'clock noon of Saturday, August 25, 1894, at the City Clerk's office in the City Hall of the City of Santa Cruz, for a new schoolhouse to be erected and built upon the school lot situated on the south west corner of Walnut and California streets in said city of Santa Cruz, County and State aforesaid. Said schoolhouse to be a two-story frame building, with basement; the main building to contain eight school rooms of about the usual size, together with laboratory and necessary cloak and teachers' rooms, and proper provisions for ventilation and heating.

The cost of said building shall not exceed twenty thousand dollars, the amount authorized by law and said Board for the construction thereof. Said Board will pay for the plans accepted for said building the sum of five dollars.

O. J. LINCOLN,
Clerk of Board of Trustees of Santa Cruz School District.

SAN JOSE, CAL., AUG. 24, 1894.

The California Architect and Building News,

GENTLEMEN:—A few days ago I sent you a copy of the *Santa Cruz Sentinel* with an advertisement for Plans and Specifications, at the same time I wrote to O. J. Lincoln, Clerk of Board of School Trustees, and asked him if the amount, five dollars for Plans and Specifications, was not a mistake.

Enclosed you will find his reply which will no doubt be of interest to architects and especially to members of the American Institute of Architects who are fighting for the advancement of our profession and fair competitions. If the law says that Plans and Specifications shall be advertised for, it certainly means that the city shall be benefited by competition, and not to give the work to the man who has the best pull or influence with the board; although the architect selected may be a very competent man, there may be better and if so this is the reason the law call for a competition to give the city the benefit of the best. Again, if they had wished to patronize Local Architects, it could have been so stated in the advertisement, and still be legal.

But when any person or public body advertises for architects services and puts a value of five dollars for the same, it certainly lowers the dignity of the profession in the eyes of the public, as many people would understand the advertisement literally.

Hoping that you can give this matter space in you paper as I should like to hear from yourselves and other architects who may be interested. Yours respectfully,

J. FAIRLEY WIELAND.

SANTA CRUZ, CAL., AUG. 24, 1894.

J. F. Wieland, Esq., San Jose, Cal.

DEAR SIR:—Yours received, the advertisement is all right, it was not intended for competition, the Trustees had decided what they wanted and put it into the hands of local architects to be worked up, but a useless law makes it necessary to squander a little coin in advertising.

Very truly yours,

O. J. LINCOLN.

NOTICE TO ARCHITECTS.

Design for a building suitable for a boathouse, clubhouse and gymnasium, to cost no more than $2,500, will be received at the office of J. E. Budd, 226 new Yo Semite block, Stockton, Cal., up to September 15, 1894. For particulars see Gus. G. Grant, Secretary, at the obovr office.

GUS. G. GRANT, Secretary. JOHN E. BUDD, President.

To the California Architect and Building News.

GENTLEMEN:—I cut the above advertisement out of the *Stockton Evening Mail*, it is such a "curiosity" I could not refrain from sending it to you, it is the most *modern* and *improved insult* to the professional architect which I have seen. Yet I cannot believe that the brother of "Jim Budd" would intentionally be the author of such an offense, to a profession every wit equal to his own, by compiling the above "demand" for designs for an Athletic Club House to cost

MDCCCXXXIV

$2500.00 and no more, without any reference whatsoever to the awarding or payment for same.

Is it not time that something should be done to protect the profession from such insults as this?

I have no doubt whatever but that they will receive designs from "Contractor Architects" and will not be surprised if *some* architects *went in for it*. A SUBSCRIBER.

THE STRENGTH AND RESILIENCE OF CAST IRON.

BY PROF. J. B. JOHNSON.

THE working qualities of structural castings are of extreme importance, so much so that the necessity for these qualities goes without saying. Furthermore, these qualities can be tested, and are tested, of necessity, in the finishing of the castings for service. Any failure of the working qualities is immediately discovered by the machinist and corrected by the foundryman. The strength and the toughness of the castings, however, are two qualities which are not unusually determined at all except by such incidental indications of strength and toughness as come from the breakage of these parts in practice under loads or shocks which they were assumed to be able to resist.

The most convenient form for a test specimen of cast iron for cross bending is a rectangular cross section about twenty-four inches long. The size of the cross section should have some relation to the thickness of the webs or parts in the structural forms into which the metal is run and for the strength of which the tests are made. Thus, if the iron is to be used in forms where the thickness of the metal is about one inch, the test specimen should be made about one inch square. If, however, the metal is to be used in parts the thickness of which is not more than ½ inch then it would be well to make the test specimens ½ inch thick and perhaps 1½ to 2 inches wide.

In testing such a bar it should be supported on knife edges near the ends, these knife edges being at a definite distance apart. This specimen is then broken by placing a load at the center, preferably by means of another knife edge, and this load applied slowly and uniformly and without shock. About the only way to do this properly is by means of a screw turned steadily and very slowly. The modulus of rupture of cast iron in cross breaking corresponds to the tensile strength of the iron, and if the iron were perfectly elastic up to the point of rupture this modulus of rupture would be the same as the tensile strength in pounds per square inch; but since cast iron takes some permanent set before it breaks, the theoretical formula no longer applies, so that the computed modulus of rupture, as determined from cross breaking tests, is found to be always very much larger that the true tensile strength of the cast iron, its average value being from one and one-half to twice as much as the strength per square inch in tension. If the cast iron has a tensile strength of 20,000 pounds to the square inch, its modulus of rupture in cross bending will be, therefore, from 30,000 to 40,000 pounds. It is common to assume that a tensile strength of 20,000 pounds corresponds to a cross breaking strength, or modulus of rupture, of about 36,000 pounds per square inch. To find this modulus of rupture from a cross breaking test on a rectangular bar we use the following simple formula:

$$f = \frac{3}{2}\left(\frac{W\,l}{bh^2}\right)$$

where f=modulus of rupture in cross bending in pounds per square inch; W=load at center of beam in pounds; l=length of beam between bearings in inches; b=horizontal breath of beam in inches; h=vertical height or depth of beam in inches.

It is much better to use this formula and compute f from the cross breaking weight W, and the dimensions of the bar b, h and l, than to use some thumb rule, as for instance, that a bar 1 inch square and 12 inches long should carry a load of 2000 pounds at center. This would give a modulus in cross breaking of 36,000 pounds, which indicates a very fair quality of cast iron, so far as strength is concerned; but if the specimen should prove to be a little more than 1 inch square, or a little less, there is nothing in the specification to show by how much the loads should vary to compensate for this change of size. Whereas, if it be specified that the modulus of rupture should be 36,000 pounds, that could be determined from the above formula very easily, whatever the dimensions may have been. In fact, b and h should always be measured to the nearest 1-100 inches, and, of course, the castings could not be made of any given size to anything like this degree of accuracy.

In all cross-bending tests of cast iron some means should be provided for accurately measuring the deflection of the bar up to the point of rupture. This can only be properly done by the aid of some kind of attachment to the testing machine itself. These deflections should be measured to the nearest 1-1000 inch. The use of the deflection is to enable us to compute the resilience or elastic spring of the iron, as will be explained below.

Resilience signifies the toughness or the ability of the material to resist a shock or blow. Thus, if the total breaking load be multiplied by the total deflection of the beam, and this product divided by two, the result is the resilience of the beam in inch-pounds, provided the load were measured in pounds and the deflection in inches. This product varies directly with the form and volume of the beam, irrespective of its dimensions, so that if the half product be divided by the total number of cubic inches in the beam, the result represents the resilience of the iron for a rectangular beam in inch-pounds per cubic inch of metal. This is an absolute measure of the resilience or toughness of the iron, but it is easier to weigh the specimen than it is to compute its volume in cubic inches. Hence we may find the resilience of a rectangular beam per pound of metal by dividing the total resilience by the number of pounds in the specimen, just as before we found it per cubic inch by dividing by the number of cubic inches in the specimen. The writer prefers this latter method, and therefore he recommends the following:

Rule.—Multiply the breaking load in the middle of the beam by its deflection at the time of rupture, and divide the product by twice the weight of the beam in pounds.

The result should not be less than 20 for ordinary cast iron, and may be as high as 50 for the best quality of refined cast iron, such as is commonly known at gun metal.

In all tests of cast iron in tension the specimen should be cast round, free from all defects, and then turned down in a lathe throughout its entire length, the middle portion being reduced to a somewhat smaller diameter than the ends. Such a specimen can only be broken upon a regular tension testing machine, such as few foundries have in their outfit, and hence these tests are not so well adapted to common practice as the cross-breaking tests described above.

Several concerns manufacture cross-breaking testing machines which give indications of the deflection, such as are required in the application of the rule given above for determining resilience. In these tests it is very necessary that the load be put on slowly and with perfect uniformity, and this is accomplished in all these machines by means of a screw.

It must be noted that both the strength and the resilience can be determined from the same test. Having measured the length, breadth and height of the bar, and determined the breaking load, we can compute the breaking strength as described above; also having weighed the bar and determined its breaking load and its deflection, the resilience in inch-pounds per pound of metal can be determined so that a single test in cross-breaking fixes both the strength and the resilience or toughness of the iron. It must not be forgotten that these two qualities are entirely distinct and must not be mistaken the one for the other. Thus, one mixture may be very strong and brittle, and another comparatively weak but very high in resilience. It is not impossible, however, to obtain both great strength and high resilience from the same mixture, and this, of course, is the ideal kind of cast iron. Such iron offers the greatest resistance, both to dead loads and heavy strains, and also to such shocks and blows as it may receive either in actual practice or from some accident.—*Age of Steel.*

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street
SETH BABSON, Pres. — GEO. W. PERCY, Vice-Pres.
OLIVER EVERETT, Sec. — JOHN M. CURTIS, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. — GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. — W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. — C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. — H. T. BESTOR, Treas.

THE ANNUAL MEETING OF THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE Annual Meeting of the San Francisco Chapter of the American Institute of Architects was held Friday afternoon, September 14, 1894.

The following officers were elected to serve during the coming term:

Seth Babson, President; Geo. W. Percy, Vice-President; John M. Curtis, Treasurer; Oliver Everett, Secretary, and Messrs. Jas. W. Reid, Albert Pissis, Willis Polk, Edmund Kollofrath and Geo. H. Sanders as Trustees.

Mr. Percy of the Committee on Fire Ordinances reported progress and promised a full report for the October meeting.

The Chapter unanimously passed a vote of thanks to Mr. Alfred Colin, for his services in instructing the Chapter's Classes in Drawing and Design.

An amendment to the By-Laws was presented by Mr. Sanders, concerning the withdrawal of moneys in bank.

A communication was received from the Washington State Chapter, but owing to the lateness of the hour, it was laid over for consideration at the next meeting, and ordered printed in the official organ of the Chapter, for the information of absent members.

Following is the communication in full:

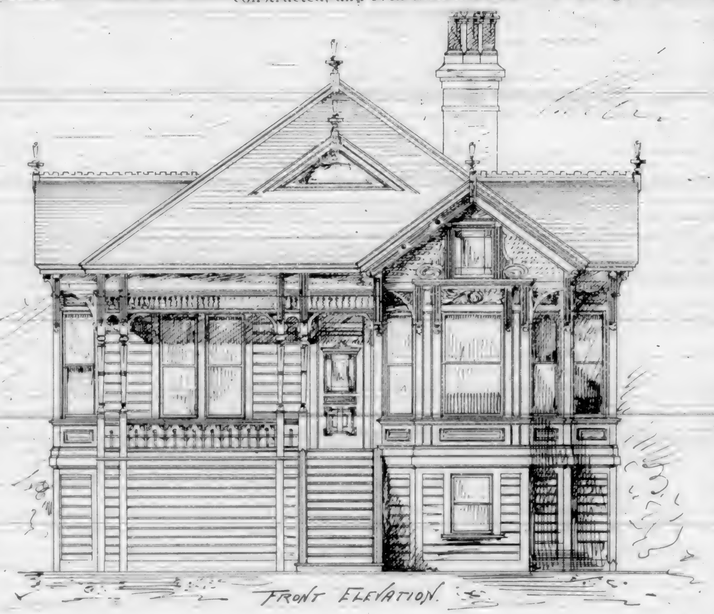
SEATTLE, WASH., AUG. 14, 1894.

Mr. Oliver Everett, Secretary San Francisco Chapter American Institute of Architects, San Francisco, Cal.

DEAR SIR:—By instruction of the Washington State Chapter of the A. I. A., I enclose you herewith copies of Resolutions and Addenda to Resolutions, which were passed by our Chapter at its regular meeting held at Tacoma, in July. These resolutions were sent to Mr. Alfred Stone, Secretary of the A. I. A., and in his letter to us of August 1st, he writes that he will submit the same to the Committee of the Institute appointed for the purpose of procuring the passing of the bill now before Congress for a reform in the methods of designing and constructing buildings for the United States Government.

In regard to the Addenda to the Resolutions, Mr. Stone comments as follows: "We think that in order to secure what you ask for, to wit: that only bona fide residents of, or voters in, a state shall have the designing of buildings within such state, it will have to be urged upon the Commissioners appointed under the new bill for it will be useless to attempt to make any amendments to the present bill, as it would probably endanger its passage, and we are now in hopes that it will be passed at this session of the present Congress."

Our Chapter disagrees with Mr. Stone in this, that by restricting the competition to architects within the state or territory in which the Government building is to be constructed, it will appeal more directly to each Senator and Representative throughout the country when he can see his own constituents more directly benefited. In a general open competition the West would be at considerable disadvantage, and in most cases, would scarcely be able to compete for Government buildings unless meetings of the Commissioners should be held in the states where the buildings were to be constructed, and even then there would be danger from the usual result of competitions in favoritism shown through influence or friendliness towards a clique.



FRONT ELEVATION.

We would be glad of an expression from your Chapter in this regard whether you will co-operate with us in urging what seems to us a very important amendment to the bill now before Congress rather than to leave it to the Commissioners after its passage. Very truly yours,

CHARLES W. SAUNDERS.
Secretary of Washington Chapter A. I. A.

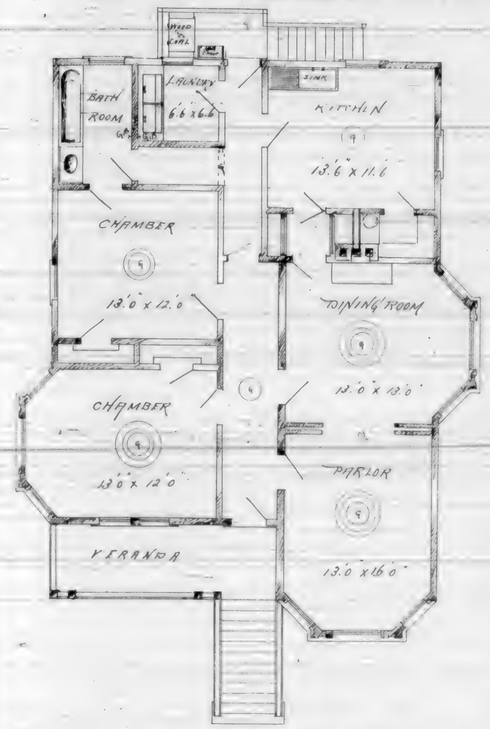
RESOLUTIONS:

WHEREAS—The peculiar manner in which the office of the Supervising Architect of the Treasury is carried on, yields architectural results in the planning and designing of the Government Buildings which suffer in comparison with the private architecture of the country, and are costly, inferior not only to the best contemporary private structures, but to the average ones, and

WHEREAS—The American Institute of Architects, and members of the profession who do not belong to that body, together with many others who are deeply interested, have been trying for years to bring about a reform in the methods of designing and constructing buildings for the United States Government; therefore, be it

RESOLVED—That the Washington Chapter of Architects hereby pledges itself to second the action of the American Institute, faithfully and persistently, in efforts to obtain this reformation, in order that the Government shall have its work done at the same price that individuals pay, and by means of a service more able and skillful; to contribute to the erection of structures which shall not debase public taste; and that the Architects of the State of Washington unite in petition to their members of Congress, respectfully asking their advocacy of such legislation as is necessary to secure this result.

An Addenda to the above Resolutions, submitted by Mr.



Wickersham was adopted by vote, and the Secretary was instructed to submit it and the original Resolutions to the Senator and Representatives in Congress and to the California Chapter American Institute of Architects.

ADDENDA TO RESOLUTIONS.

All competitions for procuring plans, etc., for Public Buildings of the United States Government shall be confined strictly to the Architects who are bona fide residents of and voters in the State in which the said Public Building of the United States Government is to be erected. And the members of the Washington State Chapter of Architects, together with many that are not members, believe that the foregoing resolution, if incorporated in a statute law, will be just and equitable and of great benefit to the Architectural profession throughout the country, in this: that the architects of each state will be given an equal opportunity to display their skill and ability, in the erection of structures that should be a credit not only to the State and Nation, but to the Architectural profession as well; that the possibility of all, or nearly all, the public buildings of the United States Government being controlled by a clique or ring, would be reduced to the minimum; therefore the members of the Washington State Chapter of Architects and others, respectfully request and strongly urge that a clause embodying the foregoing resolution, be incorporated in and made a part of any bill that the American Institute of Architects has already placed or purposes placing before Congress for enactment.

Acknowledgements were ordered sent to the Rhode Island and Colorado Chapter, for copies of By-Laws of the respective chapters.

Upon motion of Mr. Bestor, the President was authorized to appoint four permanent committees on the following subjects:

The Architectural History of San Francisco and the Pacific Coast.

Statistics of Building Interests Including the Growth of Industries.

Antiquities of the Pacific Slope.

Modern Construction for Various Purposes.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

EFFECT OF VOID CONTRACT.—Where a contract is void for failure to file with the contract in the recorder's office the plans and specifications, the liens are entitled to recover the full value of the materials furnished, irrespective of the contract price.

Dunlop v. Kennedy, Supreme Court of California, 36 Pac. Rep. 765. 42.

ACCEPTANCE BY ARCHITECT NOT CONCLUSIVE ON OWNER.—Where a building contract stipulates that the materials shall be of a certain quality, and that the work shall be performed in the best manner, subject to the acceptance or rejection of the architect, all to be done in strict accordance with the plans and specifications, and to be paid for when done completely and accepted, the acceptance by the architect of a different class of work or of different materials will not bind the owner as the provision for the acceptance by the architect is merely an additional safegard for the benefit of the owner.

Lewis v. Yagel, Supreme Court, General Term, Fourth Department, 26 N. Y. Supp. 833. 102.

WHEN RECOVERY MAY BE HAD FOR EXTRA WORK.—A building contract which provides that no work shall be considered as extra unless a separate estimate in writing shall be submitted by the contractor to the architect and the owner, and their signatures obtained thereto, does not preclude a recovery for extra work done under a parol agreement between the contractor and the owner.

Lewis v. Yagel, Supreme Court, General Term, Fourth Department 28 N. Y. Supp. 833. 63.

CONSENT OF OWNER NECESSARY TO CHARGE PROPERTY.—Where a lease contains no covenant by the lesser to repair, knowledge on his part that the premises are being improved under a contract with the lessee and acquiescence therein, does not constitute the consent required by the mechanic's lien law to charge the property.

McCauley v. Hatfield, Supreme Court, Special Term, Kings County, 28 N. Y. Supp. 648. 53.

RELEASE OF SURETIES OF CONTRACTOR'S BOND.—Sureties on a bond conditioned for the erection, in accordance with certain plans and specifications, and keeping in repair, of bridge, abutments, are released from liability by a substantial change in the plans of the work, made by the principal, and accepted by the obligee of the bond, without their knowledge or consent.

Morgan County v. McKhe, Supreme Court of Kansas, 36 Pac. Rep. 717. 62.

A SIMPLE SYSTEM OF FILING CLIPPINGS.

EVERY engineer and reader of the trade journals recognizes the value of clippings and scraps taken from them, and appreciated as well the difficulty of collecting and classifying such data conveniently and so it may be readily got at for reference. Mr. Spencer Miller, engineer of the Lidgerwood Manufacturing Company, 96 Liberty street, New York city, employs a simple solution of the difficulty in a specially designed scrap cabinet and system of filing, which was described at the recent meeting before the American Society of Mechanical Engineers in Montreal, Canada. The cabinet consists of one large drawer for "miscellaneous scraps," another of the same size for a "stock drawer," two shelves for scrap books and a series of smaller drawers of uniform size. In clipping, the scraps are thrown as cut into the large "miscellaneous scrap" drawer, from which they are assorted at leisure and placed in the series of smaller drawers, each under its proper head. There are as many of these drawers as there are subjects desired to be covered.

A drawer at a time is then taken in hand and the clippings trimmed to the minimum size and pasted upon sheets of paper perforated on one edge and of uniform size.

The clippings of course are pasted only upon one side of the sheet, with date and name of publication attached. When there is a sufficient number of these sheets they are assembled in proper order in the form of a scrap book, with cover (being stapled or fastened together with thread), and these are put upon the shelves of the cabinet for reference.

By this system it will be noticed that at no time are the clippings in any form in which they cannot be easily found, neither is there any time when the books may not be rearranged. For this reason it is found better not to page the books.

The size of the sheets used in making up the books is optional with the user. Mr. Miller uses 8½x11 inches, manila paper such as is ordinarily found in the best scrap books being preferred. Each sheet is cut with a separating strip or stub 1x11 inches pasted on one edge of the same, being perforated with four holes placed at equal distances. This keeps the book from widening at the opening side. The covers are made 9x11½ and have a neatly-stamped title. They are made still, with a flexible joint one inch from the binding edge.

The large drawers are 3 inches deep. The inside dimensions of the smaller drawers are 10x11½ inches, which will allow the finished books to be dropped in if desired. One of the difficulties which arise usually to all who have a love for clipping and collecting scraps occurs when an immense amount of clippings have been collected and one feels a desire to cull. The system used by Mr. Miller permits culling better it would seem than any other. A dozen sheets may be torn out of a book and the hole can be simply closed up, and their absence is never noticed.—*Stone.*

TO MOUNT PHOTOGRAPHS WITHOUT BUCKLING.

THE satisfactory mounting of photographs is a troublesome operation, and the following suggestion from a contributor to the *Outlook* may be of assistance to amateurs: I have found a method by which a photograph or engraving can be mounted on the thinnest paper without curling or wrinkling. If the picture is a photograph it should be ironed out smooth with a hot iron and then trimmed. Mix a little gum arabic in hot water, so as to make a rather thick mucilage. Place the picture on the page in position and mark just inside the corners. Remove the picture and take some of the mucilage on a ruling pen and draw a heavy line of mucilage from one point to another, so as to make a line of mucilage all around the place where the picture is to be. As soon as the mucilage is sticky put the picture in place a book over it to keep it flat. When dry you will have a smooth mount that will not curl.

BUSINESS MOSAICS.

California Art Glass Works have removed from their old stand 39½ Fremont street to new quarters 156 Mission street. We hope to be able in our next number to give a description of their new works, which we understand are well worthy of inspection and description. Mr. Schroeder, the president of the company will be pleased to show his patrons new designs, which can be seen to better advantage in his new place of business.

Tommy—"Paw, what makes them have the weather office away up on the top of a high building?" MR. FIGG—"That is so that it will be too much exertion for a fat man to climb the stairs and kill the weather man."—*Indianapolis Journal.*

We have before this had occasion to call the attention of our readers to the good quality of Schenck's Swinging Hose Reel and wonder that any of our factories, hotels and buildings can afford to be without, if there are such let their owner think the matter over for a second time, second thought is always the best, and then go and secure an almost certain protection from the all devouring flames that from time to time sweep away the accumulation of a life time. All the hose and apparatus supplied by W. T. Y. Schenck are fully guaranteed to be what is represented. A call at 593 Mission street near Second street, will convince any one in search of protection from fire that they can find what they want and find it of the very best quality.

The dainty designs for bathing furnished by The J. L. Mott Iron Works, would almost tempt one to refrain from the sea-side; when in want of a bath, a room furnished in the latest style with all the plumbing accessible and wherever possible without cabinet work, is surely a room where one can enjoy either a hot or cold plunge with far more comfort, and far less expense than at the sea-side. Ask Mr. M. S. James the Pacific Coast representative of these works, room 35 Flood building, if this is not true and at the same time obtain from Mr. James information and circulars to give your friends who may not know all about it.

Fond MOTHER—"Yes, sir; I have a little fellow who is only ten, and yet he writes beautiful poetry." OLD EDITOR—"Well, there's some hope for 'em when you catch 'em young; you can whip it out of 'em easier then.—*Atlanta Constitution.*

Heating and Ventilating.—Wright & Olsen will furnish estimates for heating any size of building by steam, hot water or warm air; also sole agents of Magee Furnaces and Ranges, Barler's Ideal Heaters, Dr. Buckley's Water Purifier, as well as Wright's Fire Place Heaters for heating by hot water, this latter contrivance is well worthy of special notice, as a number of rooms can be heated by an ordinary fire. Call at 27 New Montgomery street, and you will not regret the time spent in the examination of the good things on the way of keeping warm that you will find there.

Merchant & Co's. Star Ventilator.—The claim for this ventilator as being above all others in scientific and functional advantages, appears well founded; being durable, noiseless and storm-proof while all down draughts are prevented Oscar S. Levy agent for Merchant & Co. can be found at 205 Market street, San Francisco, Cal.

Mother (at a party)—"Why did you allow young Saphead to kiss you in the conservatory?" DAUGHTER—"Why maw!" MOTHER—"Oh, you needn't 'why maw' me. One side of his nose is powered and one side of yours isn't.—*N. Y. Weekly.*

Fitzgerald Prepared Wall Plaster.—As the desire of good walls for your home becomes more common, the demand for this Plaster increases. Nothing like the increase of business to show that satisfaction is given; those that use it once are sure to advise their friends to do the same, and this undoubtedly accounts for the increased demand of Fitzgerald Prepared Wall Plaster. If you call at the office of the company 216 Bush street, San Francisco, you can inform yourself all about its merits.

Mr. HAYSEED (in city hotel)—"Wall, I guess yon'll have to blow out the gas, Mandy." MRS. HAYSEED—"Why Josiah? The porter made me promise not to do it.—*Life.*

If you want anything in the line of house building, or indeed of allmost any other line, go to Smith & Young, you are almost sure to find what you want. Blue prints and paper to make them on, wood carvings as well as pressed wood ornaments, mineral wool and sheathing papers, infusorial earth and Bostwick steel lath, painted and unpainted, are among the stock that is always on hand to be found at either their store 723 Market street, San Francisco or 230 South Spring street, Los Angeles. See page ix of this journal for their advertisement.

He—"What is he going to do after he graduates? SHE—"Wouldn't it be more appropriate to ask, "Whom is he going to do?"—*Truth.*

If you are interested in brick it would do your heart good to see the barge loads of brick arriving at the yards of the San Joaquin Brick Co. from their works in Stockton, Cal. A visit to the company's yard in this city on Berry street between 6th and 7th would make you think our city was about to be rebuilt with brick.

When you want anything in the line of artificial stone, concrete, sidewalks or garden walks don't forget that George Goodman does everything in this line and does it well, what more can you ask as you are sure of getting a good job at a fair price if you go to his office, 307 Montgomery street, Nevada Block, San Francisco. See his advertisement on page ix of this journal.

"What did you do with that check your father-in-law gave you for a wedding present?" "Had it framed; no one would cash it."—*Boston Gazette.*

F. H. Rosenbaum & Co., 567 Market street are always on hand to supply your wants in the way of plate and window glass—also manufacturers of mirrors, both quicksilver and patent backs, as well as ornamental cutting and beveling in all its branches.

Visitor—"Where is your mamma?" LITTLE GIRL—"She has gone out for five minutes two hours ago."—*Buffalo Commercial.*

The Pacific American Decorating Company have something well worthy the attention of those inclined to decorate their residences with landscapes, marine views, photographs of persons, animals, etc., by the Hyrroscopic process, any thing from the works of the old masters, to the latest fad of the amature photographers can be reproduced upon glass in a manner that will please and astonish any one who examines the work done by this firm, thus opening a vast field for every one to display his artistic taste in the decoration of his own hall. Call and see their work and be convinced of the great possibilities before you. C. S. Chadbourn, Pres. Peter L. Mallon, Vice-Pres.; John Mallon, Sec.

Teacher—"They builded better than they knew. Do you understand that?" BRIGHT BOY—"Yes'm; they always do." TEACHER—"Who always do?" BRIGHT BOY—"The architects, you know. Pop's new $5,000 house cost most $10,000."—*Good News.*

The removal of the office of the San Francisco Slate Company from their former rooms in the Mills building to 415½ Montgomery street, between California and Sacramento streets, reminds us to state that the California slate supplied from their quarries in El Dorado County is of a quality superior to any in the market, and at the same time the cheapest, if you do not agree with us on that point call at their new office and become convinced that it is so.

CITY BUILDING NEWS.

Broadway near Leavenworth. To build; owner, Patrick Kilduff; architects, Shea & Shea; contractors, Magner & Gallegher; signed, Aug. 30; filed, Sept. 1; cost $2885.

Broadway near Leavenworth. To build; owner, A. Buchegnani; contractor, L. Cuneo & G. B. Cavanagh; filed, Aug. 8; signed, Aug. 8; cost $3000.

Broadway near Pierce. To build; owner, Charles L. Patton; architect, W. H. Hamilton; contractor, M. J. Savage; signed, Aug. 28; filed, Aug. 31; cost $4081.

Broderick near Golden Gate Ave. To build; owners, Jas. and Ellen Gallegher; architect, C. J. I. Devlin; contractor, R. Van de Pavert; signed, Aug. 13; filed, Aug. 14; cost $3302.

Bush and Stockton. Carpenter and mill work; owner, City of San Francisco; architect, C. I. Havens; contractor, H. Whittle; signed, Sept. 5; filed, Sept 8; cost $4990.

Bush and Stockton. Three-story brick school; owner, City of San Francisco; architect, Chas. I. Havens; contractor, Henry Whittle; signed, Aug. 10; filed, Aug. 16; cost $15,275.

Brannan near 4th. Concrete work to Saint Rose Church; owner, Rev. D. Nugent; architect, J. J. Clark; contractor, S. Giletti; signed, Aug. 15; filed, Aug. 16; cost 12 cts. per cubic foot.

Castro near Alvarado. To build; owner, Robert Irwin; contractor, W. W. Rednall; signed, Sept. 4; filed, Sep. 5; cost $1750.

Courtland Ave. and Buena Vista. To build; owner, D. Masornad; architect, G. A. Berger; contractor, D. Currie; signed, Aug. 20; filed, Aug. 21; cost $3876.

Davis, Pacific, Front and Clark streets. Market building; owner, E. Henrietta, Jr. and John Telle; architect, Clinton Day; contractor, J. T. Grant; signed, Aug. 8; filed, Aug. 11; cost $50,000.

Davis near Washington. All work for foundation; owner, Isaac Kohn; architects, Pissis & Moore; contractors B. McMahon & Sons; signed, Aug. 6; filed, Aug. 16; cost $2800.75.

Davis near Washington. Removing buildings, etc.; owner, Isaac Kohn; architects, Pissis & Moore; contractors, Gray Bros.; signed, Aug. 13; filed, Aug. 16; cost $2610.

Devisadero near McAllister. Plumbing; owner, E. Happersberger; contractor, W. F. Wilson; filed, Aug. 13; cost $2282.

Devisadero near McAllister. All work except plumbing; owner, E. Happersberger; contractors, Schutte & Kreeker; signed, Aug. 13; filed, Aug. 13; cost $11,290.

Devisadero near McAllister. Painting; owner, Emil Happesberger; architects Kenitzer & Barth; contractor, J. S. Thomson; signed, Aug. 29; filed, Sep. 5; cost $1325.

Dolores near 29th. To build; owner, J. O'Connor; architect, M. J. Lyon; contractors, J. Conway & Leahy; signed, Sept. 4; filed, Sept. 13; cost $2900.

Ellis near Scott. To build; owner, Robert Alther; contractor, H. Rohling; signed, Aug. 20; filed, Aug. 20; cost $540.0.

Eddy near Steiner. Alterations and additions; owner, James Rourbin; architect, A. C. Luigens; contractor, Wm. Linden; cost $2043.

Eleventh Ave. near Clement. One-story frame; owner, W. H. Green; architect, F. Mead; contractors, W. H. Mead & G. C. Nail; signed, Sept. 8; filed, Sept. 8; cost $1790.

Fillmore near Union. To build; owner, Patrick Lynch; contractors, W. H. Stevens & E. Woods; signed, Aug. 10; filed, Aug. 16; cost $2000.

Folsom street wharf. All work on coal bunkers; owners, Dunsmuir & Sons; Engineer, H. C. Holmes; contractors, Pacific Bridge Co.; signed, Aug. 4; filed, Aug. 7; cost $27,127.

Folsom corner of Army. To build; owner, H. Drewes; architect, R. A. Van de Pavert; signed, Sept. 1; filed, Sept. 5; cost $2225.

Folsom near Fifth. To build; owner, Mrs. Catherine Borden; architect, B. J. Clinch; contractors, Doyle & Son; signed, Sep. 3; filed, Sept. 6; cost $4760.

Fourth and Point Lobos Aves. All work except painting and plumbing; owner, Chris. Bunger; architects, Mariens & Coffey; contractor, J. J. O'Brien; signed, Aug. 2; filed, Aug. 22; cost $5400.

Fulton near Lyon. A residence; owner, First United Presbyterian Church; architect, Wm. Curlett; contractors, McCulloch & Glonz; signed, Aug. 14; filed, Aug. 21; cost $3285.

Filbert near Webster. To build; owner, John Gianini; architects, Pissis & Moore; contractors, Cocein & Cahelli; signed, Aug. 30; filed, Sept. 3; cost $2450.

Frederick near Clayton. Cottage; owner, W. H. Green; contractor, Ernest Nag 1; signed, Aug. 21; filed, Sept. 8; cost $1500.

Glover near Leavenworth. To build; owner, Jas. Kaungiesser; architect, E. J. Vogel; contractor, J. Savage; signed, Aug. 13; filed, Aug. 14; cost $2675.

Green near Gough. To build; owner, Andrew Glover; architect, W. H. Wharf; contractors, Blanchard & Clark; signed, Aug. 16; filed, Aug. 16; cost $3505.

Golden Gate Ave. near Lyon. To build; owner, Fannie Ambrose; architect, M. O'Brien; contractor, D. Ross; signed, Aug. 15; filed, Aug. 18; cost $1738.

Green near Gought. Plumbing; owner, Andrew Glover; architect, W. H. Wharff; contractor, G. C. Sweeney; signed, Aug. 22; filed, Aug. 22; cost $418.

Hampshire near 23d. Alteration, etc.; owner, C. O. Johnson; contractors, Lawrence & Nelson; signed, Aug. 23; filed, Aug. 24; cost $1400.

Hyde near Sacramento. Additions; owner, Chas. R. Gagen; architects, Shea & Shea; contractor, Jas. A. McDonald; signed, Sipt. 11; filed, Sept. 12; cost $1250.

Jasper near Filbert. To build; owner, Luigi Bedout; contractors, Cuneo & Cavaglia; signed, Aug. 14; filed, Aug. 18; cost $4800.

Laidley near Grove. To build; owner, Axel L. Sohl; contractors, Peterson & Olson; signed, Sept. 5; filed, Sept. 6; cost $1600.

Lyon near Hayes. All work except plumbing and painting; owner, August F. Meyer; architects, Martens & Coffey; contractor, J. Bucher; signed, Aug. 11; filed, Aug. 14; cost $3795.

Lyon near Washington. To build; owner, Gertude S. Bowers; architect, A. Page Brown; contractor, M. J. Gallagher; signed, Aug. 21; filed, Aug. 25; cost $4463.

Lily Ave. near Laguna. Alterations and additions; owner, Thos. Conolly architect, T. J. Welsh; contractor, D. Currie; signed, Aug. 28; filed, Aug. 31; cost $1422.

Market near 8th. Plumbing; owner, Lizzie W. Moffat; architect, C. R. Wilson; contractor, R. Rice; signed, June 20; filed, Sept. 4; cost $5887.

Nebraska street. To build; owner, Akolph Richter; contractor, Cuneo & Cavaglia; signed, Aug. 30; filed, Aug. 31; cost $2800.

No location mentioned. Carpenter and plaster work; owner, J. Cavagnari, et al; contractor, J. J. Dunn; signed, Aug. 12; filed, Aug. 13; cost $1460.

Oak near Laguna. Grading, brick and cement work; owner, Jas. M. Goewey; architects, Shea & Shea; contractor, O. E. Brady; signed, Aug. 11; filed, Aug. 14; cost $1024.

Oak near Laguna. Plumbing; owner, James M. Goewey; architects, Shea & Shea; contractor, John Doherty; signed, Aug. 11; filed, Aug. 14; cost $1280.

Oak near Laguna. Carpenter work Iron and plastering; owner, Jas. M. Goewey; architects, Shea & Shea; contractor, Jas. Mooney; signed, Aug. 11; filed, Aug. 14; cost $6267.

O'Farrell near Taylor. Moving and all work except plumbing; owner, Stephen T. Gage; architect, H. A. Schulze; contractor, J. H. McKay; signed, Aug. 3; filed, Aug. 14; cost $9700.

O'Farrell near Taylor. Plumbing; owner, Stephen T. Gage; architect, H. A. Schulze; contractors, W. S. Snook & Son; signed, Aug. 3; filed, Aug. 21; cost $1400.

O'Farrell and Jones. Plumbing; owner, John Proctor; architect, T. J. Welsh; contractor, J. E. Britt; signed, Sept. 8; filed, Sept. 12; cost $2000.

Octavia and Chestnut. Grading; owners, V. S. Tevis, G. H. Roe et al; architect, C. S. Tilton; contractor, J. G. Fair; cost $6050.

Post and Montgomery. Painting and frescoing; owner, Masonic Hall Association; architects, Kenitzer & Barth; contractor, M. Harmouth; signed, Aug. 3; filed, Aug. 7; cost $2945.

Post near Leavenworth. Tinting and fresco work; owner, S. F. Verein Asso.; architects, Salfield & Kohlberg; contractors, Busch & Mocker; signed, Sept. 3; filed, Sept. 5; cost $1500.

Polk and Bonita. To build; owner, Lewis Vaish; architect, Chas. M. Rousseau; contractor, J. W. Hansbrough; signed, Aug. 16; filed, Aug. 16; cost $600.

Polk and Austin Ave. To build; owner, Mrs. Sarah Fry; contractor, O. E. White; signed, Aug. 15; filed, Aug. 16; cost $1420.

Point Lobos Ave. To build; owner, E. Servean; architects, Mathison & Howard; contractor, A; Jackson; signed, Aug. 30; filed, Aug 31; cost $1800.

Pine near Scott. To build; owner, Mrs. F. L. McNorton; contractor, B. R. Van Deusen; signed, Aug. 21; filed, Aug. 21, cost $2050.

Pine near Buchanan. To build; owner, Ann R. Meader; architect, Wm. Mooser; contractor, J. T. Hayes; signed, Aug. 28; filed, Aug. 31; cost $3393.

Potrero Ave. To build; owner, John A. Rippe; contractor, Thos. F. Mitchell; signed, Sept. 15; filed; Sept. 15; cost $980.0.

Ringold near 8th. To build; owner, Mary Hughes; architect, J. P. Brady; contractors, Holm & Sheibley; signed, Sept. 1; filed, Sept. 1. cost $2480.

Sacramento near Baker. To build; owner, Washington Dodge; contractor, Geo. Healing; signed, Sept. 4; filed, Sept. 5; cost $2600.

Sacramento near Gough. To build; owner, F. W. Leitz; architect, A. J. Barnett; contractors, Ackerson & Patterson; signed, Aug. 17; filed, Aug. 21; cost $7950.

Sacramento and Cherry. A dwelling house; owner, Harry Bevell; contractor, C. W. Duffie; signed, Aug. 21; filed, Aug. 21; cost $1600.

Sacramento and Pierce. Painting; owner, Gaston E. Bacon; architect, J. J. Manseau; contractors, Rhodes Bros.; signed, Aug. 16; filed, Aug. 22; cost $1063.

Sacramento near Buchanan. Two-story frame and brick; owner, Mrs. Phoebe Lowenth; architect, A. Page Brown; contractor, M. J. Gallagher; signed, Aug. 22; filed, Aug. 25; cost $6725.

Shanchez and 17. To build; owner, Jas. H. Cahill; contractors, Brandt & Bateman; signed, Aug. 2; filed, Aug. 24; cost $2075.

Shotwell and 25th. To build; owner, Fannie Carlisle; architect, John T. Kidd; contractors, Ogle & Smith; signed, Aug. 24; filed, Aug. 25; cost $2246.

Sharon near 15th. To build; owner, Wm. H. Gersterbeg; architect, H. Hess; contractor, Chris Knutte; signed, July 27; filed, Aug. 7; cost $1970.

Tenth near Bryant. Hose and stable; owner, Ellen J. Tierney; architect, W. C. Mahoney; contractors, R. Doyle & Son; signed, Aug. 13; filed, Aug. 14; cost $3125.

Tenth Ave. near California. To build; owner, James M. F. Baumuller; contractor, Jas. Heaney; signed, Sept. 1; filed, Sept. 4; cost $1150.

Texas near Yolo. To build; owner, Henry Hasemen; contractors, Stevens & Wood; signed, Aug. 2; filed, Aug. 7; cost $987.

Trenton near Washington. Brick building; owner, Yee Sue Kwin; architects, Townsend & Wyneken; contractor, A. McElroy; signed, Aug. 16; filed, Aug. 18; cost $4140.

Turk near Taylor. Alterations; owner, James G. Fair; day work; cost $1200.

Twenty-ninth near Dolores. To build; owner, H. Hesson; days work; cost $900.

Twenty-seventh near Dolores. To build; owner, August Schrick; contractor, R. Frost; signed, Sep. 2; filed, Sept. 11; cost $1500.

Turk and Scott. To build; owner, R. F. Morgan; architects, Shea & Shea; contractor, A. N. McIsaac; signed, Sept. 7; filed, Sept. 12; cost $1674.

Utah, Centre and Nebraska. School building; owner, California School of Mechanical Arts; architects, Percy & Hamilton; contractors, Thomas H. Day; signed, Aug. 3; filed, Aug. 9; cost $32,080.

Utah; Centre and Nebraska. Plumbing; owner, California School of Mechanical Arts; architects, Percy & Hamilton; contractors, Duffy Bros.; signed, Aug. 6; filed, Aug. 9; cost $5450.

Valencia No. 836. To build bake ovens; owner, Geo. A. Rutz; architect, E John; contractor, C. C. Koelling; signed, Aug. 13; filed, Aug. 14; cost $1080.

Van Ness Ave. near Vallejo. Brick Building; owners, Hartland & Herbert E. Law; architect, J. L. Mathison; contractor, Chas. M. Depew; signed, Aug. 4; filed, Aug. 7; cost $14,750.

Washington and Davis. foundation work; owner, John Ivancovich; architects, Pissis & Moore; contractors, B. McMahon & Son; signed, Aug. 6; filed, filed, Aug. 16; cost $7329.45.

Washington and Davis. Removing old buildings, etc.; owner, John Ivancovich; architects, Pissis & Moore; contractors, Gray Bros.; signed, Aug. 13; filed, Aug. 16; cost $5688.

Washington near Broderick. To build; owners, Hannah and Rose Phillips; architect, W. H. Lillie; contractor T. T. Pottinger; signed, Aug. 21; filed, Aug. 21; cost $4200.

Washington near Lyon. A church; owner, Rev. Jas. Worcester; architect, A. Page Brown; contractor, M. J. Gallagher; signed, Aug. 23; filed, Aug. 25; cost $4432.

Webster near McAllister. To build; owner, Victor Kuehn; contractor, J. S. Hofmeister; signed, Aug. 30; filed, Aug. 30; cost $2783.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

R. C.-E. Grunsky was endorsed for the Candidacy for Superintendent of Streets of the City and County of San Francisco by the San Francisco Chapter of the American Institute of Architects.

The Chapter wishes it understood that this departure from its usual conservative course, was not occasioned by a desire to enter politics, but from a sincere conviction that the important office of Superintendent of Streets, should be taken out of politics, and given to a man competent to design a system of sewers (instead of suffering them to be built without any system at all) and with enough energy and ability to give the city of San Francisco clean streets, and decent pavements.

We venture to say that for the million and a half dollars yearly raised and expended for these purposes, the citizens of San Francisco have but a small fraction of the benefits to which they are entitled. Street pavements are put down one year to be torn up by the next ring that gets into power, and relaid with another kind of pavement. Sewers are built at haphazard, too small where there is a large area to be drained, and ridiculously large and out of proportion where but a few blocks are to be drained.

If an architect calculates the drainage of a building, basing his estimates on the depth that the sewers in the street should be laid, and which the data in the public records state the sewer has been laid, ten to one he finds when the sewer has been reached that it is not at the depth it should be, sometimes not within several inches or several feet. Often sewers are discovered having no outlet, and sometimes not connected at all, or connected so low as to trap the flow of sewerage, and form stagnant bodies of putrid liquid and solid matter, that are a serious menace to the public health. The garbage of the city instead of being burned, is dumped into the low lands along the water front, leaving a legacy of disease and death for future generations, when the march of improvements will have built over these districts with factories and tenements.

No wonder the architects think it will be a public benefit to have a capable engineer in charge of this important office. If such a man had directed the expenditure of the thirty millions of dollars that have already been paid out for the streets and sewers of San Francisco, the city would have had something to be proud of to-day, instead of the shameful condition of affairs that has existed so long.

ANY Amendments to a Constitution deserve careful consideration before being acted upon. There is one to be passed upon by the people next election which bears looking into. We allude to that one amending Article 13 Section I, which exempts from taxation the property issued for free public libraries and museums. This is a piece of special legislation which it would be an act of great unwisdom to incorporate in our Constitution, for it leaves the door open for all manner of exceptions. If free museums and libraries not belonging to the State are made untaxable then why not any other free exhibition or building—a free dive, a free church or a free lunch, would all put up their claims to have the property used by them exempted. It is against good public policy to allow any property outside of that belonging absolutely to the people, *i. e.* National State and Municipal Property, to be exempted from taxation.

BEQUEST FOR A SCHOOL FOR MANUAL TRAINING.

THE late Mrs. Miranda W. Lux, widow of Charles Lux, a California cattle king, has in her will, given a generous portion of a $3,000,000 estate to the founding of a school for manual training; the trustees of which school are to receive, invest, reinvest and keep invested the said trust fund and property, and after paying out of the income thereof all necessary or proper expenses connected therewith, to apply the balance of the income to the promotion of schools for manual training, industrial training and for teaching trades to young people of both sexes, in the State of California, and particularly in the city and county of San Francisco, it being the desire to assist in furnishing facilities for the education of young children from the time they leave the kindergarten schools, and while they are still quite young, in what is known as "manual training," and in all kinds of training looking to the acquisition of useful trades by and through which habits of industry will be acquired and practical knowledge of those things which are useful in earning a living may be acquired.

ARCHITECTURE AND POLITICS.

FROM the following dispatches appearing in the daily papers, it can be seen how seriously politics interferes with the proper management of the office of the Supervising Architect of the Treasury Department.

If the Honorable Secretary of the Treasury, would try the recommendations of the American Institute of Architects, (as he is fully authorized to do under the existing laws,) the public would get a chance to see how much better and cheaper the government's work could be done than it is at present

However, to expect a politician to relinquish his prey, or his patronage is too much to ask of the present school.

WASHINGTON, September 18th.—The retirement of Supervising Architect O'Rourke from the Treasury Department will probably further hinder the work of the department on the plans for the San Francisco public building. Secretary Carlisle, who demanded O'Rourke's resignation late yesterday, did so, he says, for the good of the service. There will be no difficulty in his way in forcing O'Rourke out of his present position. He will retire voluntarily,

There seems little doubt that there has been a wrangle between the Supervising Architect and the Secretary of the Treasury, his assistants and also chiefs of divisions and clerks in the Supervising Architect's office for several months past, on account of this dissension. The business of the office has been delayed, and what has been accomplished has been done, so it is said, in a very careless way. Just who is to blame is a matter that cannot be satisfactorily explained at the present time. It seems certain that Secretary Carlisle has not followed a politic course with O'Rourke, for the reason that by his course he has simply made O'Rourke a mere figurehead. There has been trouble between them over removals and appointments, and any amount of trouble over the routine business of the office. Had it not been for the turmoil in the architects' department it is believed that the plans for the San Francisco building would have been prepared long before this and the actual work begun upon the site in preparing it for the erection of the immense structure that will yet be put upon it.

Supervising Architect O'Rourke stated to the *Examiner* correspondent to-day that he would retire, having been asked to do so, but that he considered a great injustice had been done him by the Secretary. Before making a thorough investigation of the affairs in this department of the Treasury, O'Rourke would not definitely state just how far the work on the San Francisco public building had proceeded, but intimated that in the change by his retirement and the appointment of a successor there would be a further delay. So far as can be learned at the Treasury to-day it is not probable that the plans for the San Francisco building will be fully completed for several weeks to come.

WASHINGTON Sept. 23d.—Ex-Supervising Architect O'Rourke has given out the correspondence with Secretary Carlisle leading to his enforced resignation. In his first letter O'Rourke alleges the existence of a conspiracy against him, the exposure of which would cause a grave public scandal, and he therefore asks a postponement of his resignation until he can be heard.

In his reply Secretary Carlisle disclaims any specified accusations against O'Rourke's personal or official integrity, but alleged want of system and harmony in the administration of his office O'Rourke thereupon forwarded his resignation, expressing regret that he was not given the privilege of a personal conference with the Secretary, and adding:

"I have felt for some time that I could not continue to hold the office without surrender of honor and self-respect, because of the many obstructions persistently placed in the way of an orderly and reputable administration of this important office, mainly by two of my subordinates, absolutely without technical or artistic knowledge, who I regret to say, claim to have the special countenance and support of the department. It seems to me that if I had been so unfortunate as not to satisfy these gentlemen in the solution of grave questions of the administration to request my resignation on that account is a unique reversal of the action ordinarily taken when such a state of facts develop in any public office."

ALL Architects wishing to start an Architects Protective Association will please communicate with W. J. Cuthbertson, care CALIFORNIA ARCHITECT AND BUILDING NEWS, 408 California street.

CLEANSING THE STREETS OF PARIS.

BY HENRY SMITH WILLIAMS.

IN spite of the rather poor natural facilities for drainage and for disposal of garbage, Paris is probably the cleanest large city in the world. Even the walls of its buildings, private as well as public, are required by law to be painted or otherwise renovated at regular intervals, while its streets are perpetually swept and scrubbed till their surface is the wonder and admiration of beholders in general and of visitors from the Western hemisphere in particular. Manifestly the average Parisian is largely imbued with love of cleanliness, whatever his short-comings regarding the virtue alleged to rank next above it. But love of cleanliness, even with love of comfort added, will not fully explain the extraordinary attention bestowed upon the exterior of Paris. Love of the beautiful supplies the missing motive. The Parisian regards the parks and boulevards of his beloved city as among its distinctively artistic features. He speaks of the Place de la Concorde, for example, as "one of the most beautiful creations of modern art," and of favorite boulevards as component details of a system "illustrating the clear and solid tendency of French art as developed soon after the Renaissance," and the like. Imagine the average New-Yorker considering his parks and streets in such a light as that! Why, most New-Yorkers seemed but little disturbed when it was suggested, not very long ago, that an elevated railroad should be built along the Western Boulevard, almost the only extensive avenue in the older portion of the city that has considerable artistic possibilities, let alone realities. Under corresponding conditions the average Parisian would faint at such a suggestion. But, after all, utilitarianism must of necessity precede æstheticism. Art is long, and the Western metropolis is young. Doubtless when our municipality is as old as Paris now is (that will be about the year 4000!) we shall be as artistic, as proud of our streets, and as clean—though this last seems from the present standpoint impossible—as Paris is to-day.

In the mean time the method by which Paris is kept clean may advantageously be considered by the residents of New York and other cities that by lack of method are kept filthy. A tangible idea of the magnitude of the problem may perhaps be gained from the statement that the pavements of Paris cover in the aggregate an area equal to that of a field a mile wide and more than five miles long—a field, that is to say, of some 3500 acres. Much the larger portion of this street surface is paved with stone blocks; but as elsewhere, macadamized and asphalt surfaces are substituted on many streets, and of late pavements of wooden blocks have come into vogue, finding favor in particular in the vicinity of school buildings and wherever else noiseless traffic is especially to be desired. The stone pavement is by far the most economical, as it costs on an average but 76 centimes per square metre annually to keep it in repair while the asphalt surface costs 2 francs, the macadamized, 2 francs 17 centimes, and the wood, 2 francs 80 centimes. The aggregate annual cost of keeping all pavements in repair is two million dollars. This has no reference to cleaning the streets but only to putting them in readiness for traffic. It is a most essential preliminary, however, as the streets could not possibly be kept clean if they were not also kept in perfect repair.

The refuse demanding the attention of the street-cleaning department of Paris, as of any other great city, may be divided, speaking generally, into two classes—(1), pavement garbage, caused largely by the traffic of 100,000 horses and about three millions of people, and (2), ash-barrel garbage, by which term may be described such waste products of indoor living as cannot be removed, via., the sewers, but must be carted off through the streets. Unlike New York and most other cities, Paris handles these two kinds of garbage according to different systems. For convenience of description the one may be spoken of as the street-cleaning system, the other as the scavenger system. The duties of the street-cleaning system are to sweep the streets, depositing all suitable matter in the sewers, and collecting that unsuited for such disposal in piles convenient for removal, and to sprinkle, wash, and in general supervise the pavement surface. The duty of the scavenger service is to remove the ash-barrell garbage, together with such bulkier portion of the pavement garbage as cannot properly be swept into the sewers. The sewers themselves, which as everybody knows, are unique in point of size and in many ways wonderful, have only an incidental interest in the present connection, though of course as accessories of the street-cleaning service they are absolutely essential, and their importance in the general sanitation of the city cannot be overestimated.

When it is said that the entire pavement surface of Paris is swept clean every morning, and that to accomplish this only 3200 men are employed at most, and a large proportion of these only for a few hours each day, it hardly needs saying that the work of the street-cleaning service is conducted in a most systematic way. The plan adopted is, however, extremely simple. For purposes of street-cleaning the city has been divided into 150 districts, called "ateliers." Each atelier is presided over by an official known as a "cantonnier," who is held responsible for the proper care of all streets in his territory. Such a force of subordinate employees and such machinery and apparatus are provided as experience has proved necessary. The "cantonniers" and their chief subordinates are salaried officials (at from 100 to 125 francs per month), and give their entire time to the service; the other employees are paid by the hour (strong men receiving 32 to 37 centimes, and "women, children, and weak men from 25 to 30 centimes"), and, as a rule, are employed only during the morning hours.

The main body of the work is done by sweeping-machines, each drawn by a single horse, the work of hand-brooms being only supplementary. The order of procedure is practically the same in all parts of the city and over all kinds of pavements. Summer and winter the work begins at 4 A. M. In advance goes a watering-machine to settle the dust. This is followed in narrow streets by a single machine, and in wider ones by two or even three machines in succession, the foremost one nearest the centre of the street. Such a cavalcade passing up one side of a street and back the other shifts all the surface garbage of that street into the gutters on either side, while a single man following flushes the gutters, and directs all but the bulkier portions of the garbage into the sewer openings, situated at short intervals between the hydrants. Such a cavalcade is equivalent to a small army of hand-sweepers, it being estimated that each machine does the work of twelve men—that is to say, of twelve Parisians, each of whom is supposed to sweep 500 square metres in an hour. Just what the equivalent of a machine would be in terms of the doughty-muscled time-servers employed in New York's farcical street-cleaning service it would be hazardous to guess. Each cohort of watering-carts and sweeping-

machines has, of course, its definite district to cover, and so accurately are these apportioned that all the different cohorts finish at practically the same time. By about 8:30 the entire city has been swept, and the detritus worn from the pavements by thousands of hoofs and wheels the day and night before is being carried harmlessly on through the great sewers to the Seine, instead of hurtling on every chance gust into the face of the wayfarer, as does the dust of less-favored cities.

The regular morning sweeping accomplished, the work of the permanent employees of the department varies somewhat in different regions and with varying seasons. In some regions the sweeping-machines make a second tour, in the afternoon, supplemented now by a larger corps of hand-sweepers, since the traffic makes their work less uniform and complete than in the early morning hours. Asphalt pavements must be freely sprinkled with sand to prevent horses from slipping, this being especially necessary because an ordinance that aims to protect the pavement from needless wear requires all horses to be smooth shod. But the most important work of all, from a hygienic stand-point at any rate, is the constant sprinkling of all the streets with water during dry weather. Here again there is a delightful contrast to the New York method, according to which the greatful shower of the sprinkler, far from falling for just and unjust alike, seeks out with most unorthodox discrimination the abodes of those fortunates alone who are able to pay for the privilege to private contractors. In Paris street-sprinkling is not an individual enterprise but a public function, and water everywhere seems free as air. The sprinkling is accomplished in part by horse-cars of familiar pattern (of which 370 are utilized in summer), but in part also by hand-carts, and very largely by hose attached directly to hydrants. The last is by far the most economical method, and one-third of the entire street surface is sprinkled in this way. In addition to the constant sprinkling, the entire road-bed is inundated from the hydrants at regular intervals, varying from one to three days. All gutters are flushed twice every day. Thus the entire street surface of the great city is actually washed clean at regular intervals, as no New-Yorker ever dreamed of seeing his city washed, except at the fitful pleasure of Jupiter Pluvius. This free use of water, by which the germ-laden dust is prevented at all times from permeating the atmosphere, is a hygienic measure of such importance that it deserves to rank as the most admirable feature of a marvellously efficient street-cleaning system.

The entire street-cleaning system just described is conducted directly by the municipality as such, and all persons employed in this service are paid directly from the city treasury. Such is not the case with the scavenger service, by which all bulkier garbage is removed. For this service also the city is districted, but there the parallel ceases, as the person in charge of each district is not in any proper sense an employee of the city, but only a contractor in his service. Contracts for this work are let to the lowest responsible bidder for terms of three years. The garbage becomes the property of the contractor, and within certain restrictions specified in the contract, he is free to remove it in his own way, employing whom he will to do the actual work as freely as if it were a purely individual enterprise. While these two systems are thus radically different in details—one introducing the socialistic and the other the individualistic principle—yet they are not, after all, so wide apart as might at first thought appear, inasmuch as each rests on the sound principle of divided and accurately traceable responsibility.

The cantonnier has practically the same power over his district in all that pertains to street-sweeping, sprinkling and the like, that the contractor has over his in regard to the removal of bulky garbage, and in practice it seems to make little difference that the subordinates of the one are employed by the city, those of the other quite independently of the city authorities. Needless to say, however, it would make a very great difference in a city where a partisan spoils system governed municipal appointments.

That there should be this separation of the scavenger service from the regular street-cleaning service seems an anomaly, but it is one that is easily explained. It grows out of the fact that the bulkier garbage, which is handled exclusively by the scavenger service, has a commercial value. It is hauled to the suburbs of the city, and sold for fertilizing purposes to farmers. Not long ago the contractors who handled this garbage paid the city for the privilege of removing it, as it could be sold at a profit. But of late the growing city has so encroached upon suburban farms that the market for fertilizers near the city is restricted, and hauling to a distance is so expensive as to take away all profit. Hence, though the garbage is still handled and disposed of in all other respects as before, the city is now obliged to pay the contractors instead of receiving pay from them. The entire cost of the city, however, of removing garbage, which aggregates about a million tons yearly, is only about $400,000.

The official scavenger system in operation is so simple as to require but a few words of explanation. At 6:30 A. M. in summer, and seven in winter, the garbage wagons start on their respective routes. Each wagon patrols on an average a district inhabited by 3500 persons. They are monster vehicles, each drawn by two or three horses hitched tamdem, and they contrast strangely with the diminutive carts used for a similar purpose in New York. With each wagon are four men—a driver, an emptier, and two lifters—and a woman follows with a broom to complete the work. So expeditiously is the work effected that by 9:30 each morning the entire mass of garbage not claimed by the sewers is on its way to the suburbs. For the most part it is hauled to its destination in the wagons in which it was collected.

While the official scavenger service of the city is thus simplicity itself, there is a supplementary, unofficial service that is much more complicated, and which deserves especial notice, because it is in all respects the most picturesque element in the entire street-cleaning system. The half-tramp garbage-cleaner who searches ash-barrels for scraps of possible value is a familiar figure in every city, but in Paris this individual has developed and systematized his calling till it is fairly entitled to rank as a trade. There are no fewer than 41,000 persons in the city who follow this calling. They are known as "biffins," or "chiffonniers," and they regard their trade as a perfectly legitimate and honorable one. Indeed, there are various ranks or grades even in this humble calling, and, ridiculous as it seems, the tyro must serve an apprenticeship before being regularly admitted to the title of professional cantonnier. During this stage of apprenticeship the novitiate wanders about the streets at night, securing such gleanings as he may, but being chiefly rewarded by the experience gained as to different localities and their possibilities, and as to tricks and methods of the trade. In course of time he gains acquaintance with some professional gleaners, who ultimately introduce him to one of the "cities" where the chiffonniers live by themselves, usually presided over by a proprietor, who furnishes the lodgings and purchases the gleanings. The novitiate, now becomes a professional, is no longer known as a simple

'r am asseur de nuit," or night picker, but has mounted to the rank of "coureur," or habitual runner. He is now equipped in the regular way, with "dorser" lantern, and "crochet" (hook), and is instructed in the regular methods of the trade, working only at daybreak, when the ash barrels and boxes are sent out upon the sidewalks. In course of time the coureur requires by right of custom a regular territory, his exclusive right to glean in which is respected by his fellow-chiffonniers. He has now reached the highest grade in his profession, and is known as a "placeur," or placeman. So well observed is the unwritten law that gives the placeur an exclusive right in his territory that he may even sell his privilege—sometimes in a favored locality, receiving from ten to forty dollars in return—and the rights of the purchaser will be similarly recognized. This might at first thought appear to be a case of honor among thieves, but such a deflection does the chiffonnier injustice, for as a rule these gleaners are not thieves. On the contrary, they are credited with rather an unusual degree of honesty, and it is said that they frequently restore to their rightful owners such articles of considerable value as accidentally find their way into the garbage-boxes.

The gleanings that are the legitimate spoil of the chiffonnier cover a wide range of articles, the chief of which are old paper (including books and pasteboard), ropes and thread, wadding and cotton, rags of all sorts, metals, remnants of earthen-ware, horse-hair, human hair, horn, fragments of whalebone, cork, India-rubber, bones, grease, old leather and rabbit skins, and bread crusts. It gives one a curious sense of the degree to which diversification of industries is carried in an old civilization to learn that for each of these different classes of refuse articles there are purchasers who are specialists in that line alone, handling nothing else. For example, there are fifty merchants who handle nothing but old rags, and twenty firms, some of them of considerable importance, that purchase only scraps of paper.

It has been estimated that the gleanings of the placeur bring him sometimes as much as fifty cents a day, and that the majority of coureurs realize thirty cents a day, while even the apprentice or night runner may make twenty cents a day. The total sum received annually by the entire army of chifionniers for the gleanings rescued by them from the garbage-boxes is estimated to exceed $5,200,000—about three times the sum expended by the city on its entire street cleaning department. The gross weight of the material rescued by the chiffonniers daily, and through their efforts restored to channels of usefulness, is estimated at about 1250 tons. When it is understood that this is all material of which the contractors who own the entire mass of the garbage would make no use what ever—most of it, indeed, being of such a nature as to detract from the value of the garbage for purposes of fertilization—it will be seen that the work of the unofficial gleaners has a more than respectable degree of economic usefulness, and the pride with which the chiffonnier regards his "profession" seems in a measure justified.

While the street cleaning department of Paris, with its various official sub-departments and its unofficial accessories, attains a degree of efficiency under all ordinary conditions approaching perfection, there is at least one contingency that it has not learned to fully cope with. When at long intervals there comes a heavy fall of snow, the machinery of street-cleaning is for the moment clogged, and the authorities are sorely distressed. A partial solution of the difficulty has been reached in the suggestion that salt be sprinkled on the snow to facilitate thawing, and large quantities of salt are now kept on hand for this purpose. This is a costly expedient, however, and its efficiency when applied on a large scale has not yet been demonstrated. But, after all, snow falls in large quantities so infrequently in Paris that the question of its removal can hardly be considered a serious, even if it is an unsolved problem. To the outsider it might even seem that a few days of discomfort from this source, at intervals of several years, might rather be regarded as serving the useful purpose of teaching the public to appreciate by contrast the delightful cleanliness of their streets under all other conditions.

To the New-Yorker who contemplates the harmonious systems by which Paris is made clean each morning before the breakfast time of the average Parisian, there must come by antithesis a painful vision of the methods followed and results achieved by the street-cleaning department of his own city. The results are patent: Paris is clean; New York is—not clean. As to details of method, it would perhaps be unfair to press the comparison too far, the conditions of the tasks set the street-cleaning departments of the two cities are so diverse. Paris has the advantage of mild winters, relatively free from frost and snow; also of an inexhaustible water supply, and a matchless system of sewers. But, on the other hand, New York has unexampled natural facilities for drainage, and for sewage and garbage disposal, in that it lies on a relatively narrow strip of land, with an arm of the sea at either elbow; and it would seem that these incalculable advantages of location ought to far more than outweigh any disadvantageous climatic conditions.

It may be freely conceded, however, that there is one condition imposed upon the street-cleaning department of New York that insuperably bars the work of that department from successful competition with that of the Parisian authorities. This is the fact that the road-beds of the average streets in New York, only passable or worse in the first instance, are allowed to go unrepaired till their condition is wretched. To make such streets clean in the sense in which the streets of Paris are clean would be impossible; but they might be, and ought to be, made approximately clean—as they never are.

It would be quite useless, however, to seek an explanation of the difference in efficiency between the street-cleaning departments of Paris and New York in the diversity of conditions, natural or artificial, existing in the two cities. The real explanation is to be found only in the difference of principle underlying the operation of the two departments. These principles are not at all difficult to fathom. They may be correctly deduced from observation of the most humble sweepers in there spective services. The Parisian sweeper moves as if he had some definite task to accomplish. He has energy, facility, efficiency. Plainly he is hired to help clean the streets. The average New York sweeper creeps wearily along the street, usually moving against the wind, as if determined that such dust as he stirs at all shall be instantly rescattered, and on no account gathered in piles to tax the muscles of the garbage-gather. It requires no unusual insight to discover that he is a time-server who can not have been selected because of his fitness for the work in hand. A slight investigation would show why he was selected. The law requires that he shall be a citizen; custom demands that he shall be a faithful follower of the dominant political party. In a word, he has been selected not because of efficiency as a street-cleaner, but because of usefulness at the polls. To secure and maintain his position he requires not energy but "influoence;" if he is to work his way to better positions in the service he must have not push, but "pull."...

This, then is the fundamental difference between the Parisian and the New York systems of street-cleaning. The authorities of Paris desire and demand that the street-cleaning department shall give them clean streets; the authorities of New York demand that the street-cleaning department, like every other department of municipal government, shall give them—patronage. While this continues so—that is to say, while Tammany continues to rule the city—we may look towards Paris with envy, but not with hope of emulation, for no amount of money placed in coffers controlled by Tammany will suffice to give our streets that degree of cleanliness which public health and public comfort require, and which, were our better citizens less absorbed in their own immediate personal affairs, and more sensible of their duties as voters, public sentiment would imperatively demand.—*Harper's Weekly.*

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

COMPETITIVE design of the Washington State Capitol at Olympia, Washington, Laver & Mullany, Architects, San Francisco, Cal.

RESIDENCE, Carthage, Ill., Geo. W. Payne & Son, Architects, Carthage, Ill.

CORRESPONDENCE

To the Editor of the California Architect and Building News.

SIR:—In the course of my perambulations through the City Hall Corridors, I happened into the court room of Justice of the Peace G. W. F. Cook, I there heard a very extraordinary summing up of a case delivered by him which deserves publication.

As I understood the case was where an architect was sueing an owner for working drawings, receiving bids, etc., for work which did not go ahead.

There was a direct conflict of testimony between the parties as to orders to make these plans; it is not necessary to go into the merits of the case as that didn't cut any figure presumably in the Court's mind, for he did not mention that he considered that one of the parties' oath was better than the other's, but said that the preponderance of evidence was with the defendant (the owner) because it was the custom of architects to make drawings for owners for nothing on the strength of or in consideration of the chance of them getting the work if it went ahead.

The suit was not for sketches, but for full working drawings and specifications, of the making of which the owner admitted he was fully cognizant at all times—therefore the decision of the Justice could refer to only full working drawings and specifications—so that the summing up amounted to this: that it was a practice among architects to submit full working drawings and specifications to owners and to charge them nothing for them on the contingency of getting the work.

The remarks were quite contrary to the facts as I knew them, for I had never heard of a high class architect ever doing such a thing, or for that matter even a low class architect.

I had heard of several cases of architects preparing *sketches* for nothing but never in twenty-five years' experience of architects preparing *working drawings and specifications* for nothing.

I had the curiosity to see the Judge next morning and ask him whether my ears were not deceiving me in the matter, but he answered me that he was quoted correctly. If this opinion goes abroad without protest by all architects, clients will become to believe that such is the case and expect it, and an honorable profession is degraded into a gambling concern—where architectural gamblers put their brains and abilities against one another and put them down against a bank which takes no chances at all, but simply rakes in all the valuables in sight and delivers no equivalent.

The decision, which is the subject of this letter, is only another straw showing the necessity of the establishment of an Architects' Protective Association, the merchants have their M. P. A. why not the Architects their A. P. A.

I hope Mr. Editor that you will see your way clear to receive the names of all architects willing to combine in such a body to protect themselves from future calumnies and exploitation.

Yours,

STROLLER.

To the Editor of the California Architect and Building News:

There are five essential points in securing the health of houses:

1. Pure air.
2. Pure water.
3. Efficient drainage.
4. Cleanliness.
5. Light.

Without *these*, no house can be healthy, and it will be unhealthy in proportion as they are deficient.

FIRST—To have pure air, your house must be so constructed that the outer atmosphere shall find its way into every corner of it. Architects should consider well, the vital importance of this, and the owner of a house should see to it with his own eyes, no house with any untrapped, unventilated drain pipe (communicating immediately with an unventilated sewer) whether it be from water closet, from sink or from hopper, can ever be healthy; an untrapped sink may at any one time spread fever or Dyœmia among the inmates of a palace.

SECOND—Spring Valley water is not considered always healthy unless it is filtered; well water properly managed is better, but the only healthy water is distilled water.

THIRD—A very great evil in house construction is carrying drains underneath the house; such drains are never safe.

FOURTH—Without cleanliness, within and without your house, ventilation is comparatively useless and there are others ways of having filth inside a house besides foul drains. Old paper walls of years standing, dirty carpets, and uncleaned furniture, are just as ready sources of impurity to the air as if a manure heap were in the basement. People are so unaccustomed from education and habits to consider how to make a home healthy, that they never think of it at all, and take every disease as "from the hand

of providence," when in fact it is from their own neglect of a most serious responsibility.

FIFTH—A dark house is always an unhealthy house, always an ill-aired house, always a dirty house; want of light stops growth, and promotes Scrofula, Rickets, etc., among children, and sours the mind and temper of the parents. A great genius once wrote "Where there is sun there is thought," all natural law confirms this, for without sunlight we must degenerate in body and mind.

How stand we in San Francisco in our relation to pure air and sun light?

The architect generally speaking makes ample provision for ventilation and sun light, but as generally speaking, these prime factors of health existence are ignored by the housekeepers. For proof of this, let those interested make inspection any day in any part of San Francisco, say western addition, and view there the noble examples of Classic and Renaissance architecture. The first feeling will be exultant, but soon succeeded by one of sorrow, to see such grand mansions shut up, impervious to air or light, and suggestive of asylums or penal settlements. Can there be here *Mens sana in corpore sano*? With the prime elements of healthy existance shut out "Sound minds in sound bodies" is absent.

In 1844 the writer was connected with a "Health of Towns Commission" appointed by Parliment, Dr. Lyon Playfair, M. P. for Edinboro, was President, he said "The Air of no house with water closets inside can be free from Malaria."

When the average number of people in a house is from five to twenty persons, the amount of fetid Effluvia afloat every day is incalculable. The only remedy, is *complete detachment* of all water closets and urinals from the house, a detachment not less than six feet. This detachment might be in the form of a square tower connecting with the house by covered bridges at each story.

M.

ENGINEERS OF TO-DAY—AND YESTERDAY.

THE September number of *The Engineering Review*, published in London, England, contains a portrait of Hamilton Y. Castner, trained as a chemist under Professor Chandler, at the School of Mines, Columbia College, New York. Mr. Castner has while still a young man proved himself not only a successful inventor, but has shown a combination of skill, pluck and perservance seldom seen displayed in one person.

The following interesting account of this young chemist is taken from an article headed "Engineers of To-Day and Yesterday" in *The Engineering Review*:

Hitherto, Mr. Castner has been chiefly known to fame as the inventor of the sodium process for the manufacture of aluminium—a process which, although highly ingenious and successful, so far as it went, has since been largely superseded by the electrolptic processes of manufacture inaugurated in the United States and Switzerland, and carried on both there and in different European countries. At the time when Mr. Castner began his experiments on the production of sodium, both that metal and aluminium were exceedingly dear and were regarded rather as curiosities of the chemical laboratory than as products of practical utility in the arts. Mr. Castner was so convinced that there was a wide field open for research and improvement in this direction, that, in 1884, he gave up his business as a public analyst in New York city, in order that he might devote himself entirely to experimental researches, designed to cheapen and improve the manufacture of these products. After two years of hard work, he succeeded in perfecting his well-known process for the manufacture of sodium, by means of which the cheap production of aluminium was made possible. Convinced that there was then a better field for his process in Europe, Mr. Castner, in 1886, came to London, an utterly unknown man, without friends, and almost without acquaintances, determined to win his spurs in this recondite branch of metallurgy. As a preliminary, he took premises near the Waterloo Railway terminus, where he constructed a small experimental plant, which was to be the pathway to the success at which he aspired. He then obtained introductions to Sir Henry Roscoe, F. R. S., Dr. Anderson, F. R. S., Major-General Sir Andrew Clark, Gerald W. Balfour, and other men of influence and technical ability, who became interested in his process, and were convinced that, as it involved the production of aluminium at very much less than it had previously cost, and sodium at almost as many pence as it had previously cost shillings, it was one of great immediate value and of high promise for the future. As the most likely means of bringing the process into immediate practical operation, a company was formed, of which these and other gentlemen became directors, and works were built by Mr. Castner, at Oldbury, near Birmingham, for working it on a large scale. These works realized to the fullest extent every anticipation that had been formed and every expectation that had been raised by Mr. Castner and his friends—excepting only one. They produced aluminium of a higher purity than had ever before been known on a regular commercial scale selling it at 15*s.* per lb., which was gradually reduced to 5*s.*, where it had never before been sold for less than 60*s.*, and they produced sodium at 1*s.* per pound., where it had previously cost 4*s.* or 5*s* or more; but there was no guarantee that the Castner process could "hold the field" permanently as the only one suited to the production of cheap aluminium. At that time chemists and metallurgists all over the world appeared to be working with might and main at aluminium processes, and quite a crop of different systems was announced and discussed month after month in the chemical and engineering press. In the end, another American chemist succeeded, as did also a Swiss chemist at the same time, in producing aluminium by an electrolytic process for 2*s.* to 3*s.* per lb., and works were immediately constructed at Pittsburgh and in Switzerland. The American firm, headed by the well-known Pittsburg engineer, Mr. Alfred E. Hunt, has since, together with the Swiss firm, had a divided monopoly of this industry, at a cost of production that would not have been believed possible when Mr. Castner's friends and himself constructed works to manufacture and sell the metal on a large scale. In other words, it came to this, that while Mr. Castner by his process reduced the cost of aluminium to one-tenth of what it had been when the old Deville process only was employed, the electrolysis process succeeded in reducing the cost of the metal to only one-twentieth part of its cost, less than three years before. Needless to say, the Pittsburgh and Swiss companies got the field, and it is only just to add that they have since held it.

As the success of the electrolytic processes meant the failure of the process introduced by the Aluminium Company, the latter was necessarily placed in a very serious and critical position. They had still the sodium process left, but four years ago there was hardly any demand for sodium, and

there did not appear to be much hope in that direction. Nevertheless, Mr. Castner and his friends made up their minds to develop the manufacture and demand for sodium as the only resource open to them. At that time they had constructed works which had cost them over £60,000, and which were adapted to the carrying on of five or six distinct original chemical processes, actually being worked to an extent that involved the daily consumption of seventy tons of coal, 40,000 lbs. of hydrochloric acid, 10,000 lbs. of caustic soda, 20,000 lbs. of lime and limestone, and many other materials required for the production of 500 lbs. of aluminium. All this was stopped, and Mr. Castner, acknowledging his defeat, took the most manly and praiseworthy course open to him, by endeavoring to improve his sodium process, and create an industry in this metal. The result was that he was able before long to announce that his original sodium process hae been superseded by an electrolytic method which gave to his Company a monopoly in the manufacture of this product. Although there was no market for sodium at that time, Mr. Castner turned his attention to its application in the cyanide manufacture, and he succeded before long in realizing his aim—namely, that practically all the cyanide, which is now so important in the recovery of gold, should be made from prussiate of potash by the use of sodium. In other words, Mr. Castner has created a sodium industry on a considerable scale where none had previously existed.

Even this result, however, did not satisfy the aspirations of Mr. Castner and his friends. At the time when he was endeavoring to improve his sodium process, peroxide of sodium was a curiosity, even in the laboratory, and had no commercial value. Mr. Castner conceived the idea of its manufacture on a commercial scale for application as a direct bleaching agent, and for the preparation of hydrogen peroxide. This he accomplished, inventing a process and securing patents for its manufacture from sodium, until now it has become such a formidable competitor to barium peroxide that that chemical has fallen in price to the extent of over 50 per cent. since sodium peroxide became a commercial product.

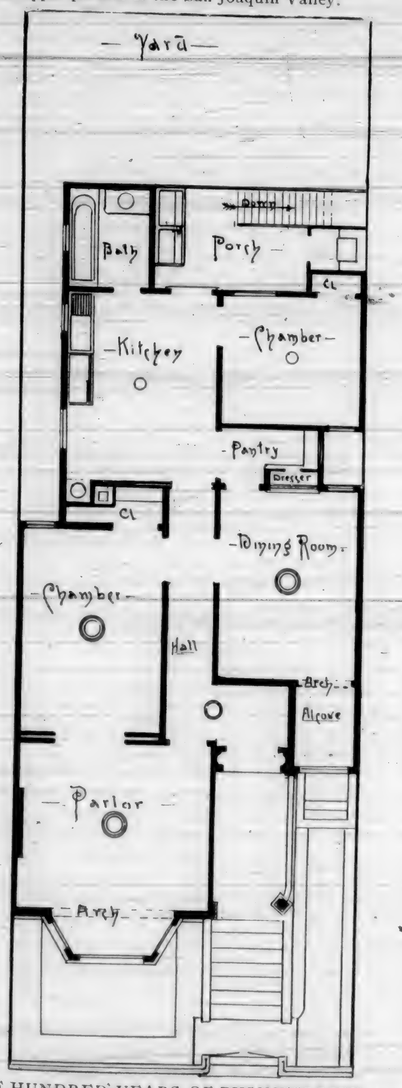
In the course of his investigations into the electrolytic preparation of sodium, Mr. Castner became convinced of the possibility of producing caustic soda and bleach by a somewhat similar process, and undertook experiments with that end in view. In this direction many others had worked before him, and not a few appear to have attained the threshold of success, but difficulties have invariably arisen mainly in connection with the means employed for preventing the recombination of the products of the electrolysis. Mr. Castner, with his accustomed ingenuity and resource, has solved the problem effectually, and has succeeded in producing caustic soda of exceptional purity at quite 30 per cent less than the price at which it is produced by the Leblanc-Weldon process hitherto adopted. Satisfied with the results disclosed by Mr. Castner, the directors of the Aluminium Company have recently erected a large plant for the manufacture of caustic soda and chlorine by the Castner process. That plant, completed only last month, has been examined by a number of the leading chemical experts of the day, and the judgement pronounced upon it, and upon the system generally, has been entirely favorable. In short, Mr. Castner has devised a process which appears to be destined to revolutionize the alkali trade, and to supersede the present processes of manufacture. Of the importance of such achievement to Mr. Castner and his company it is unnecessary to speak. To the alkali manufacturers of the Clyde, the Tyne, and the Mersey, it is, however, manifestly a very serious matter. They have invested upwards of six millions of capital in existing plants and works, which would largely be rendered useless by the success of the Castner process, so that they stand face to face with a grave dilemma.

COUNTRY COTTAGE.

BOOKS AND PERIODICALS.

LIPPINCOTT'S Monthly Magazine comes to hand for September with the complete novel "Captain Molly" by Mary A. Denison author of "That Husband of Mine." Among the short stories "The Sale of Uncle Rastus" is one that will be hard to read with a dry eye.

THE GAS AND PETROLEUM YIELDING FORMATIONS of the Central Valley of California by W. L. Watts, M. E., from the State Printing Office at Sacramento, to those interested we will mention that a free copy can be obtained by application to the State Mining Bureau, 24 Fourth street San Francisco. The article is a correlation, of all the information as yet obtained by Mr. W. L. Watts concerning the gas and oil yielding formations in the central valley of California and the neighboring foothills, also the result of experiments made to determined the full value of the natural gas both at Sacramento and Stockton and in certain localities in the upper portion of the San Joaquin Valley.



ONE HUNDRED YEARS OF BUSINESS LIFE, 1794-1894. A handsome phamphlet with the above title tells the story of the house of W. H. Schieffelin & Co., New York. The illustrations showing a portrait of the founder of this famous business house, as well as the portraits of the present members of the firm and also various buildings that form an interesting memorial, as well as a land mark in the history of the city of New York.

The ILLUSTRATED PACIFIC STATES comes to hand with the announcement of a change of publishers, A. T. Dewey having retired from the management. Jennie E. Patrick and Frank J. Francoius assume control and promise that not only will the high character of the Illustrated Pacific States be maintained, but improved upon. Office, 2 Market street, San Francisco. Price $1.00 per year.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

CANCELLATION BY PAROL AGREEMENT OF CONTRACT UNDER SEAL.—Where after commencement of work on a building, the owner agrees to permit the contractor to retain twenty-five dollars already paid him above his expenses, and to pay for the material furnished, in consideration of the cancellation of the contract, such agreement is not void for want of consideration. A contract under seal must be cancelled by parol agreement.

Blagborne v. Hunger, Supreme Court of Michigan, 59 N. W. Rep. 657.

WHERE ONE IS LIABLE FOR USE OF PARTY WALL.—Under an agreement that when any part of a party wall shall be used by the party who did not construct it, or by his heirs or assigns, he or they shall pay half the cost to the party who did construct it, one is not liable for such payment because, at the time she party who did not construct the wall, built a house on the adjoining lot, he was mortgagee of the lot. Nor is he liable because he afterwards became owner of the lot through foreclosure; continuation of the building, after its erection, not being a use of the wall within the agreement.

Pfeiffer v. Matthews, Supreme Judicial Court of Mass., 37 N. E. Rep. 571.

LIABILITY FOR USE OF PARTY WALLS.—The original owner of two lots built houses upon each lot, with a party wall between them, and afterwards sold them to different purchasers without imposing any obligation as to the party wall. A predecessor in title of the present owner of one of the lots built the wall higher after strengthening its foundation. The owner of the other lot having built his house higher, and used the addition to the wall, was not in the absence of an agreement, liable for such use.

Allen v. Evans, Supreme Judicial Court of Mass, 32 N. E. Rep. 571.

CREATION OF EASEMENT BY RESERVATION OF DEED.—A reservation by the owner of a building comprising two stores in a deed conveying one of them, of "the rights to use the front stairs and hall on the second floor in common with the owners of the premises hereby conveyed," which stairs and hall communicate with both stores creates an easement appurtenant to the premises retained by the grantor, the benefit of which passes to subsequent purchases of the latter premises.

Waltz v. Waltz, Supreme Court of Michigan, 59 N. W. Rep. 531.

EFFECT OF UNFULFILLED CONTRACT UPON MATERIAL MEN.—Where the statute provides that every person save the original contractor, claiming a mechanic's lien, must within thirty days after the "completion" of any building file his claim of lien, and that cessation from labor for thirty days on "any unfinished contract," shall be equivalent to a completion thereof. Persons who furnish material to a contractor who abandoned his contract were not entitled to mechanic's liens where their claims were not filed within sixty days after such abandonment, though the owner afterwards made a contract to complete the building, with another, who completed it.

Johnson v. La Grave, Supreme Court of California, 36 Pac. Rep. 650.

FIXTURES TO REALITY MUST BE PERMANENT.—A derrick used in a stone quarry, capable of removal from one point to another, as required, is not a fixture subject to a lien for material and labor furnished in its construction, though fastened by means of a post set in the ground, and guy ropes attached to the rock by anchor bolts if its removal would not injure the realty.

Honeyman v. Thomas, Supreme Court of Ore, 36 Pac. Rep. 636.

PAYMENT IN ADVANCE DOES NOT DEFEAT LIEN.—Where the owner of a building pays the contract price to the contractor, before it is due, such payment does not defeat the right to mechanic's liens, though it was made before notices of liens were filed.

Banham v. Roberts, Supreme Court, General Term, Second Department 28 N. Y. Supp. 828.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.
SETH BABSON, Pres. GEO W. PERCY, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

THE ANNUAL MEETING OF THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE regular monthly meeting of the San Francisco Chapter of the American Institute of Architects was held on October 12, 1894.

There were present Messrs. Babson, Sanders, Henriksen, Bestor, Lyons, Everett, Curtis, Polk and Cuthbertson.

The most important business consisted in the consideration of the report of the Committee having in charge the preparation of a new set of Fire Ordinances for this city, which committee submitted the result of its labors during the past two years. As the hour of adjournment was reached before the discussion was fairly opened, the Chapter decided to have weekly evening sessions on Fridays at 8 P. M., at which the members of the Chapter are particularly requested to be present.

A member present having made the astonishing statement that a judge on the bench had publicly declared it to be the custom among architects to provide working drawings and specifications to clients for nothing, on the mere chance of being employed, it was resolved to instruct the Secretary to inform his Honor "that it is not now, and never has been the custom among architects, to prepare working drawings and specifications for clients on speculation."

Mr. Marsden Manson was present by request, and gave a great deal of valuable information about the present lack of system in regard to the sewers of this city, and after discussing the evil at some length, the following preamble and resolutions were unanimously adopted:

"WHEREAS, the needs of this city demand that the streets and sewers be placed under competent engineering supervision, and as the California Association of Civil Engineers has put forward one of its prominent members, Mr. C. E. Grunsky, as a candidate for the position of Superintendent of Streets, be it therefore

RESOLVED, that the San Francisco Chapter of the American Institute of Architects, endorse the candidature of Mr. C. E. Grunsky, for the position of Superintendent of Streets, and place itself on record as to the vital importance to the building and business interests, of our streets and sewers being under the supervision of competent professional engineers.

BUSINESS MOSAICS.

It is very necessary that we should have on the Board of Freeholders—the Charter makers, an Architect and Civil Engineer. As questions will arise during the progress of their labors—which can only be considered properly by the aid of an experienced man of those professions. We are therefore glad that one of the Parties has seen fit to nominate for that position our esteemed colleague—W. J. Cuthbertson.

School TEACHER—"What have the numerous expeditions to the North Pole accomplished?" SCHOLAR—"Made geography lessons harder."—*Life.*

W. P. Fuller & Co.—This firm from long experience in the paint business can give you facts about paints, and what is more can sell you paint that is in fact all that is claimed. The Phoenix Pure Paint is guaranteed absolutely pure and satisfactory on the building, or they will replace it with any material the architect may select. What more can be asked? If you want the new wall finish or washable water color use Duresco, manufactured by this firm.

Daughter—"I love him he is the light of my life." FATHER—"Well, that is all right, but I object to having my house lit up by him after midnight."—*Pearson's Weekly.*

In all matters connected with sanitary appliances "The J. L. Mott Iron Works" are leaders. The fixtures shown in this edition are especially adapted for Rail Road Depots, School houses, Barracks, Insane Asylums and large buildings, where strength, durability and cleanliness are desired as well as perfection from a sanitary point of view. The well-known reputation of this house is a sure guarantee that the fixtures are all that is claimed for them.

Last May the Illinois Chapter of the American Institute of Architects, instituted the first Chicago building trades and national exhibition which was held in their rooms, at 63, 65, 67 and 69 Washington street, Chicago, May 15th to June 2, 1864.

The Bostwick Steel Lath Co. had an exhibit of their justly celebrated Fire-proof steel lath and on June 30th were awarded a medal and diploma for merit. The same came to hand yesterday. Below we give a copy:

This is to certify that the Illinois Chapter of the American Institute of Architects awarded a Medal for Merit to the Bostwick Steel Lath Co., for its exhibit of steel lath and construction in the First Annual Chicago Building, Trades and National Exhibition held in the Institute of Building Arts, May 15th to June 2, 1894.

MINARD L. BUSS, Chairman Jury of Awards. H. W. PIERCE, Manager. *The Niles Daily News.*

"That's a good idea, Carry it out," said the editor to the man who came in with a better plan for running the paper.—*Philadelphia Record.*

W. & J. Sloan & Co.—From personal experience we can vouch for the style, price and quality of the goods sold by this firm. If you want carpets that is the place to go to, while for furniture no better place can be found in the city: their upholstery is unrivaled. If you call at 641-647 Market street you will be convinced of the truth of this assertion.

Mother—"And what did you do when he kissed you? I hope you showed him you were angry and indignant." DAUGHTER—"Yes, indeed! I was up in arms at once."—*Puck.*

Schenck's Swinging Hose Reel.—If there should be still any in want of this invaluable article for the protection of mills, factories, hotels and public buildings. Now is the time to make protection against the winter fires almost absolute. Do not forget that the reduction of insurance goes a long way towards paying for this almost indispensible safe guard against the extension of fire—a word of warning before hand is worth a volume of regrets after your building is reduced to ashes for want of this very article that can be found at 593 Mission street near Second, San Francisco.

Man in a hurry—"Is there a way of getting to the Grand Central Depot sooner than by taking this car?" URBAN CONDUCTOR—"Yes, sir; run and catch the next car ahead."—*New York Press.*

Richmuller's Door Opener and Closer is the very thing you want if you are building, because it is the most perfect, simple and durable opener and closer in the market. As there are two wires used, one for opening and one for closing, it will be evident the door is under full control as if you had the door knob in your hand. Orders left with Geo. Richmuller, 320 Nineteenth street, will be promptly attended.

Fogyduff—"I have no money to spend in advertisements." PACER—"Of course you havn't, and that's just the reason."—*Boston Transcript.*

Surely the manufacture of Art Glass is not one of the lost arts, for although the same has been made for several centuries, it has remained for the end of the Nineteenth Century to produce the wonderful effects and delicate shadings in color and tone, that we see in Church windows as well as in private residences, of the present day. The progress made in this particular branch of architectural embellishment has amply kept place with all other arts and sciences, so we thought it not amiss to give a brief description of the process of Manufacturing Art Glass.

It is through the courtesy of Mr. Wm. Schroeder, president of the California Art Glass, Bending and Cutting Works, 103 and 105 Mission street, that we are enabled to do so. The gentlemen mentioned, kindly escorted us through the vast establishment and explained to us all the intricacies of the art. Leaving the elevator (for it is on the third floor) we step into a hall leading to the public and private offices, thence into an elegantly appointed show room, here we were shown samples of art glass, cut, embossed, beveled and all other kinds of ornamental glass work for architectural purposes, variety enough to satisfy the most fastidious in an artistic sense, also all purses could be accommodated, for some beautiful work we saw for a very moderate price.

This article having for its object the description of how art glass is made, we will not linger here but proceed through an immense room where all the machines for glass cutting, beveling, grinding as well as the furnaces for beveling glass, are to the Art Glass Room proper. This room, about 40x50 feet in size contains a great many tables and work benches, at one end of the room we observe the artist designing the patterns actual size on thin detail paper, all the lines represented "lead lines" while the spaces between are for the different colored kinds of glass, the names of which are marked thereon, then the pattern passes to the assistant artist who traces the same on heavy detail paper, this latter being cut with a peculiar kind of shears by following all the lines. Now we have all the small and large patterns in which shape the glass is to be cut, which the art glass cutter, on the table adjoining the artist, cuts by placing each separate pattern on the glass, and running around the same with a diamond. Before cutting the glass the glass cutter submits the same to the artist for inspection to make sure it is the desired color or shade. All the glass pieces are then placed on the first design, which is called the working pattern. Then the lead glazier takes it in hand and puts lead around and between all the pieces, always keeping the outermost in place with round nails, driven into the table. When the leading is done the joints are all soldered so as to make the whole light one solid frame. Having soldered both sides the light is now turned over to the cementing table. The cement is brushed over the glass and lead and thoroughly rubbed in on both sides, after all superfluous cement is cleaned off the light is put aside for it to harden, which eventually becomes as hard as the glass itself and virtually makes the glass and lead one piece. The lead, the cut end of which looks like a capital H, is turned through a mill, also in this room: ten different sizes can be made, for the most delicate tracing to large Church windows. The above description relates to mosaic art glass windows, the same applies to figure windows, only that the parts of a figure, as the face, hands, etc., are painted on the glass, which is already cut to shape by a special artist who has his studio next to the show room, as he requires a north light, for he must paint the glass while looking from a comparatively dark room toward the light, and the latter must be as unchangeable as possible. All the paintings must be fired three and in some cases four times before they are ready for the lead glazier, the reason for this is that the colors vanish to a considerable extent after each firing and they have to be applied again and again until a satisfactory result is obtained. The glass for draperies, foliage, etc., is opalescent or semi-translucent glass and is obtained from factories in Europe and the East which make a specialty of manufacturing the same. Of course it remains for the artist to select the colors and shades to attain the desired result of harmony and design.

In some future article we may give a description of the different processes for the manufacture of Ornamental Glass Cutting as well as beveling, bending, embossing, etc. We cannot close without mentioning the fact that the firm quoted above received the highest award for Art Glass, the Gold Medal, at the late Midwinter Exposition.

CITY BUILDING NEWS.

Army near Folsom. To build; owner, C. H. Drew; contractor, R. Trost; cost $2800.

B[illegible]ver near Noe. To build; owner, Patrick Parnell; contractor, Chas. Eriksen; signed, Sept. 15; filed, Sept. 17; cost $3500.

[illegible]ett near 21st. To build; owner, George Resing; contractor, A. Petry; signed, Oct. 15; filed, Oct. 16; cost $2715.

Buchanan and Olive Ave. Plumbing; owner, M. Brown; architect, Clinton Day; contractors, Ickelheimer Bros.; signed, Sept. 15; filed, Sept. 18; cost $1650.

Broadway near Mason. To build; owners, Jean and Maria E. Baron; architect, Emil Depierre; contractor, Jas. McLean; signed, Sept. 14; filed, Sept. 18; cost $5000.

Broadway near Mason. Plumbing; owners, Jean and Maria Baron; architect, Emil Depierre; contractor, H. Williamson; signed, Sept. 14; filed, Sept. 18; cost $740.

Broderick near Park Road. One-story frame; owner, Wm. W. Delano; contractor, W. W. Redmill; signed, Sept. 29; filed, Oct. 5; cost $160.0.

Bryant near 18th. Alterations and additions; owner, Mrs. Ellen Mullen; contractors, J. H. Rothgeber & J. M. Mullins; signed, Aug. 31; filed, Sept. 20; cost $1660.

California near Lyon. To build; owner, P. J. Fitzpatrick; architect, W. H. Wharff; contractor, F. W. Mauricer; signed, Oct. 8; filed, Oct. 12; cost $3300.

Corporate Limits of the City and County of S. F. To build; owner, D. W. Teltjen; architect, J. M. Curtis; contractor, Randolph P. Sanchez; signed, Oct. 8; filed, Oct. 12; cost $1850.

Church near 20th. To build; owner, P. H. Ruddock; architect, R. H. White; contractor, W. Fegeler; signed, Sept. 11; filed, Sept. 13; cost $7750.

Clement and 3d Ave. To build; owner, D. Dangers; architects, Kenitzer & Bath; contractor, W. J. Field; signed, Sept. 18; filed, Sept. 20; cost $1670.

Clement and 5th Ave. To build; owner, Ernest Uebner; architect, A. J. Barnett; contractor, Ed. Mooney; signed, Sept. 29; filed, Oct. 3; cost $3030.

Day near Dolores. Four five-room cottages; owner, J. M. Comerford also builder; cost $6000.

Desiadero near Sacramento. Additions; owner, A. W. Cranbury; architects, Percy & Hamilton; contractor, E. W. Kern; signed, Oct. 2; filed, Oct. 3; cost $3000.

Eleventh and Minna. Three-story frame and additions; owner, Julia Martin, architect, M. J. Lyons; contractor, Thos. Kinrad; signed, Aug. 25; filed, Sept. 7; cost $9100.

Eleventh and Minna. Plumbing; owner, Julia Martin; architect, M. J. Lyon; contractor, H. Russchmidt; signed, Aug. 25; filed, Sept. 17; cost $1200.

Ellis near Mason. Plastering, etc., on six story brick; owner, Maurice Casey; architect, Henry A. Schulze; contractor, Dan Leahy; signed, Sept. 8; filed, Sept. 19; cost $4800.

Ellis near Mason. Artificial stone work; owner, Maurice Casey; architect, Henry A. Schulze; contractor, Geo. Goodman; signed, June 6; filed, Sept. 19; cost $1033.

Fair Oaks near 25th. To build; owner, Hilda M. G. Roberts; contractors, Dashlberg & Lund; signed, Sept. 20; filed, Sept. 22; cost $3000.

Folsom near 10th. Two three-story frames; owner, Chas. Bach; architects, Kenitzer & Barth; contractors, Peterson & Olsen; signed, Oct. 4; filed, Oct. 4; cost $12,084.

Folsom near 10th. Plumbing; owner, Chas. Bach; architect, Kenitzer & Barth; contractor, G. C. Sweeney; signed, Oct. 4; filed, Oct. 4; cost $1898.

Folsom near 25th. To build; owner, Mrs. J. B. Lieb, wife of A. H. Lieb; architects, Martins & Coffee; contractor, J. Bucher; signed, Oct. 9; filed, Oct. 10; cost $4050.

Fifteenth near Castro. Cottage; owner, Mary O'Brien; architects, Shea & Shea; contractor, M. J. Gallegher; signed, Sept. 12; filed, Sept. 15; cost $1075.

Fillmore near McAllister. To build; owner, L. C. Levy; architect, J. B. Wuerschring; contractor, J. S. Hafmeister; signed, Oct. 15; filed, Oct. 15; cost $5000.

Fourth Ave. and California St. To build; owner, John F. Meinert; architect, R. H. White; contractor, Emil Aoelle; signed, Sept. 17; filed, Sept. 17; cost cost $3750.

Fourth Ave. and Clement. To build; owner, Chas. K. Hawthorne; architect, C. F. Robertson; contractor, C. Larsen; signed, Sept. 22; filed, Sept. 24; cost $2000.

Fillmore and Sutter. Plumbing; owner, Mrs. Peter Crichton; contractor, E. J. Duffy; signed, Sept. 24; filed, Sept. 25; cost $1150.

Golden Gate Ave. and Lyon. Five frames buildings, 12 flats; owner, Roundtree Brothers; day's work; cost $15,000.

Golden Gate Park. Removal of the Royal Pavilion; owner, Executive Com. Mid-Winter Fair; architect, A. Page Brown; contractors, Mahoney Bros.; signed, Oct. 1; filed, Oct. 2; cost $5350.

Glover near Jones. To build; owner, Hannah Wortsmith; architect, Victor Monet; contractors, Mullan & Harrigan; signed, Sept. 15; filed, Sept. 18; cost $2402.30.

Glover near Leavenworth. To build; owner, Mrs. M. Chubakar; architects, J. J. & P. J. Newsom; contractors, Jackson & Leavers; signed, Sept. 17; filed, Sept. 18; cost $2025.

Grove near Webster. Alterations and additions; owner, Herman Fischer; contractor, T. C. Cochrane; signed, Sept. 11; filed, Sept. 18; cost $1200.

Greenwich No. 527. To build; owner, Louise Steiz; contractor, Jean Baptiste Pene; signed, Sept. 24; filed, Sept. 26; cost $1502.

Guerrero bet. 15th and 16th. Alterations; owner, F. W. Kreling Sons; architect, W. H. Armitage; day's work; cost $10,000.

Haight near Devisserdero. To build; owner, James M. Kane; contractor, James J. Mausenu; signed, Oct. 2; filed, Oct. 3; cost $6000.

Harrison near Beale. owner, Robert S. Moore; architect, C. I. Havens; contractor, J. J. Dunn; signed, Sept. 18; filed, Sept. 24; cost $2800.

Hyde near Pine. To build; owner, Fred. Degnan; contractor, J. M. Hoege; cost $4000.

Hyde near Pine. Carpenter work; owner, H. W. Hutton; architect, W. H. Lillie; contractor, Wm. J. Field; signed, Sept. 17; filed, Sept. 20; cost $4000.

Howard near Leavenworth. To build; owner, Jos. Eigel; architect, R. H. White; contractor, James Campbell; signed, Sept. 17; filed, Sept. 20; cost $6400.

Howard near 8th. Plumbing; owner, Jos. Eigel; architect, R. H. White; contractor, Geo. Humphreys; signed, Sept. 17; filed, Sept. 22; cost $1120.

Jackson and Laguna. Excavations and grading; owner, W. F. Whittier; architect, E. R. Swain; contractor, C. A. Warren; signed, Sept 25; filed, Sept. 28; cost $700.

Jackson street No. 427. Maccaroni factory; owners, L. Valsangiacomo & S. Romani & Co.; contractors, McIntosh & Woolpmann; signed, Sept. 27; filed, Oct. 5; cost $1425.

Jackson near Broderick. To build; owner, Ida and Luella Gillishle; architects, Coxhead & Coxhead; contractors, Chas. Paff & Co.; signed, Oct. 12; filed, Oct. 14; cost $3875.

Jones near Greenwich. Three frame buildings two flats each; owners, R. C. Bolton, Eliza M. Bolton and Francess B. Melliss; architect, Wm. Patton; contractor, Geo. H. Walker; signed, Oct. 2; filed, Oct. 3; cost $12,457.

Jones near Greenwich. Plumbing, etc.; owners, R. C. Bolton. Eliza M. Bolton and F. B. Milliss; architect, Wm. Patton; contractor, John Doherty; cost $1840.

Landers near 16th. Frame building and stable; owner, Geo. Scherer; contractor, Christ Senweizer; signed, Oct. 8; filed, Oct. 9; cost $1150.

McAllister near Baker. To build; owner, W. J. Randell; architect, Oliver Everett; contractor, J. B. Kearny; signed, Sept. 24; filed, Sept. 24; cost $2176.

Mission near 30th. To build; owner, Chas. A. Russler; contractor, E. McHugh McWest; cost $3000.

Oak near Masonic Ave. One-story frame; owner, William M. O'Brien; architect, Smith O'Brien; signed, Oct. 1; filed, Oct. 2; cost $2250.

O'Farrell near Leavenworth. Plumbing; owner, Emma M. Ricker; architect, W. H. Lillie; contractor, W. H. Tobin; signed, Sept. 18; filed, Sept. 19; cost $1185.

O'Farrell near Stockton. Plumbing; owners, Gulzeit & Malfanti; architects, Pissis & Moore; contractor, E. James Duffy; signed, Sept. 26; filed, Sept. 27; cost $10,500.

Page and Scott. To build; owner, F. Koch; architects, Salfield & Kohlberg; contractor, Chas B. Schmid; signed, Sept. 11; filed, Sept. 13; cost $6955.

Page and Scott. Plumbing, gas fitting, etc; owner, F. Koch; architects, Salfield & Kohlberg; contractors, Shepard Bros.; signed, Sept. 11; filed, Sept. 21; cost $900.

Page near Webster. To build; owner, Louis Friedlander; architect, J. F. Kenna; contractors, Hood & Watson; signed, Sept. 27; filed; Sept. 27; cost $3140.

Pacific Ave. near Buchanan. Alterations; owner, Mrs. H. R. Muzzy; architects, Mahoney & Ryland; contractors, Ackerson & Paterson; signed, Sept. 14; filed, Sept. 15; cost $4300.

Post and Montgomery. Marble work, etc.; owner, Union Trust Co.; architect, Clinton Day; contractors, Fink & Schindler; signed, Sept. 13; filed, Sept. 14; cost $5998.

Post near Hyde. To build; owner, Lawrence Glennon; architect, V. Vettin; contractor, W. H. Wickersham; signed, Sept. 8; filed, Sept. 19; cost $3600.

Sewell near Greenwich. To build; owner, L. Capurro; architect, Emil Deperre contractor, S. Soywell; signed, Sept. 21; filed, Sept. 22; cos. $2000.

Prospect Ave. near Virginia. To builder; owner, M. D. Coleman; contractor, J. E. Schulz; signed, Sept. 28; filed, Sept. 28; cost $1225.

Precita Ave. near Bernal Heights. To build; owner, John Rootkeever; day's work; cost $3000.

Point Lobos Ave. near 6th Ave; Concrete work; owner, French Benevolent Society; architect, E. Depierre; contractor, S. B. Cushing; signed, Oct. 3; filed, Oct. 3; cost $955.75.

Point Lobos Ave. near 6th Ave. Iron fence, etc.; owner, French Benevolent Society; architect, E. Depierre; contractor, Western Iron Works; signed, Oct. 3; filed, Oct. 3; cost $2060.

Pine near Lyon. To build; owner, Stephen Edwards; contractor, Thomas F. Crawford, signed, Oct. 3; filed, Oct. 3; cost $2450.

Scott and Green. Planing mill work; owner, E. A. McCarthy; architect, J. C. Newsom; contractor, A. Hansen; signed, Oct. 13; filed, Oct. 15; cost $2450.

Scott near Bush. To build; owner, Frank J. Shonig; architect, W. H. Wharff; contractors, Schuler & Bauer; signed, Sept. 21; filed, Sept. 24; cost $2900.

Steuart and Folsom. Repairs; owners, Osmer & Co.; architect, H. Gelfuss; contractors, Larenzen & Fevier; signed, Sept. 25; filed, Sept. 25; cost $2000.

Stanyan street, Sutro's addition. To build; owner, F. A. Hjett; contractors, Peterson & Person; signed, Oct. 2; filed, Oct. 3; cost $1636.

Shotwell near 25th. To build; owners, L. A. Hayward & wife; architects, Mathew & Coffey; contractor, R. B. Kicks; signed, Oct. 2; filed, Oct. 3; cost $6151.50.

Steiner near Feli. To build; owner, James P. McGinty and wife; architect, C. J. I. Devlin; contractors, Ogle & Smith; signed, Oct. 5; filed, Oct. 10; cost $3753.

Sutter near Lyon. Alterations, etc.; owner, Herman Steffens and wife; contractor, Geo. Lack; signed, Oct. 13; filed, Oct. 15; cost $3500.

Tehama near 8th. Alterations; owner, Luke O'Conner; architect, M. J. Welsh; contractors, Simanton & Griffin; signed, Sept. 13; filed, Sept. 14; cost $1185.

Tennessee near Sierra. To build; owner, H. J. and Katie M. Shroder; contractor, T. C. Cochrane; cost $1995.

Townsend near 7th. Alterations and additions; owner, Timothy Hopkins; architect, Henry A. Schulze; contractors, Ingerson & Gore; signed, Sept. 15; filed, Sept. 19; cost $14,390.

Twenty-fourth near Castro. Cottage; owner, T. A. Born; cost $2200.

Twenty-fourth and Bryant. To build; owner, Elizr Jane Harkins; architect, M. J. Welsh; contractor, Ira W. Coburn; signed, Oct. 10; filed, Oct. 10; cost $1200.

Twelfth near H. To build; owner, Mrs. M. R. Kavanuagh; architect, W. H. Lillie; contractor, T. T. Pottinger; signed, Oct 13; filed, Oct. 13; cost $2028.

Van Ness Ave. and Clay. Stone, brick and terra-cotta work; owner, Claus Spreckles; architects, Reid Bros.; contractors, McPhee & Grolliere; signed, Aug. 27; filed, Sept. 17; cost $51,030.

Van Ness Ave. and Geary. Alterations and additions; owner, Mrs. Julia Martin guardian Jefferey's Marten; architect, J. M. Lyons; contractor, H. Jacks; signed, Oct. 2; filed, Oct. 6; cost $8329.

Van Ness Ave. and Geary. Plumbing, etc.; owner, Mrs. Julia Martin guardian; architect, J. M. Lyon; contractor, H. Williamson; signed, Oct. 2; filed, Oct 6; cost $1084.

The California Architect and Building News.

Copyrighted 1894, by the California Architectural Publishing Company.

OFFICE, 408 CALIFORNIA STREET, SAN FRANCISCO, CAL., U. S. A.

VOLUME XV. NOVEMBER 20th, 1894. NUMBER 11.

A MONTHLY JOURNAL DEVOTED TO THE ARCHITECTURAL INTERESTS OF THE PACIFIC COAST.

Published on or about the 20th of each month by The California Architectural Publishing Company. The Stockholders being Architects and others interested in the profession.

SUBSCRIPTION TO THE JOURNAL, - $3.00 PER YEAR IN ADVANCE.

ESTABLISHED 1879. INCORPORATED 1889

NOW IN THE FIFTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

IN this part of the country, the increasing use of decorative plaster work for the ornamentation of exterior surfaces, is the cause of our calling attention to the necessity of careful attention being paid by architects and superintendents to the quality of the materials used for this purpose.

Thirty years ago, a great part of the ornamental work on the facades of buildings was done in this material, and its great durability is shown by the excellent preservation of most of the work done at that period of our city's growth.

The experience gained at that time, and the improvements since made in the direction of increasing the weathering qualities of this material, allow of its being safely used as a legitimate decorative material, provided it is made and handled by parties capable of appreciating its requirements, and honest enough to fulfill them in its manufacture.

We lately inspected a piece of a frieze that had been in position less than two years, and had already begun to disintegrate, owing to the flimsy construction and poor quality of material used in making it. In fact it was no more capable of giving satisfactory service, than the cheapest quality of staff used in the temporary structures of our late Midwinter Fair.

Let every architect and superintendent insist on getting good material and workmanship in his decorative plaster work, as the future appearance of his buildings depends largely on this point being insisted on.

Carelessness in this regard will surely cause dissatisfaction sooner or later, and there is no more excuse for excepting inferior material in this case than in passing poor cement when used for concrete work. We will refer to this again in a future issue.

AS the fifteen Charter makers have been selected and are ready for business, attention ought to be turned to suggestions to the end that the Charter will be likely of carriage by the people.

We have only space in this number to allude to one clause, that in regard to the division of the city into districts or wards having about equal population, say twelve wards as we have at present. Divide the whole city from San Mateo to North Beach into twelve strips run-

ning from ocean to bay, each strip to be of as near as possible equal in population. At every census (ten years) a re-distribution to be made according to the population at that time following the same method. By having this elastic system no gerrymandering can take place and all parts of the city will be equally represented.

CONCRETE CONSTRUCTION, ITS PRACTICAL APPLICATION.

PAPER READ BY ERNEST L. RANSOME OF CHICAGO, LATE OF SAN FRANCISCO, BEFORE THE AMERICAN SOCIETY OF ARCHITECTS, OCTOBER 17, 1894.

THE practical application of concrete may be conveniently divided into four divisions, viz:—

1st. False work.
2d. Materials.
3d. Tools.
4th. Labor.

The second division can be usefully divided into four sections, viz:

A. Cement.
B. Aggregates.
C. Iron.
D. Water.

Division A. False Work:

Concrete in respect to False Work is unfortunate in comparison with other masonry because it not only needs more expensive centering whenever centering is necessary: but it also usually requires cribbing, whereas, other masonry does not.

This characteristic entirely prohibits its use in many cases where in all other respects it would be very desirable and it is therefore an obstacle to the more extended use of this valuable construction that should be minimized as much as possible.

Of late years I have met with considerable success by adopting systems of standard centering and cribbing, which whilst not of universal application, are of great use, permitting as they have done of the construction of floors and buildings that otherwise could not have been attained.

Such false work can be used over and over again many times for a long period without material change or repairs, and the parts ultimately requiring renewing are comparatively inexpensive, but as this is of interest to the contractor rather than to the architect, I will not enter into a detailed description thereof.

Great difficulties have ofter arisen in the swelling of the sheeting of the centering or cribbing, caused by the wood absorbing the moisture of the newly placed concrete. From this cause many arches have been lifted and broken, floors cracked, and walls thrust out of line. By using sheeting boards of a moderate width, say six to eight inches, and bevelling one edge slightly, the boards may be put close together and when expansion occurs, the only effect will be to slightly crush the outer edge of the bevel without lifting or disturbing the concrete abutting or resting upon it; the widest side of such boards being of course placed facing the concrete.

This is such a very inexpensive, simple and unfailing remedy, that from its conception I have used it in all cases; and since its use I have never had any trouble from swelling of the timber. Some such device as this is especially necessary in dry climates, also in light construction, such as floors of but an inch or two in "thickness" or hollow walls.

For standard centering or cribs, if of wood, it is advisable to make them of planed lumber. The surface of the wood should be thoroughly coated with common, thick kerosene oil before it is used for the first time, and before each subsequent use it should be brushed over afresh with the oil. Fresh oil is objectionable, as it is apt to injure the surface of the concrete and linseed oil is generally too gummy for this purpose.

It may be accepted as a general rule that false work of light sheeting, well braced, is more economical than heavier planks with braces farther apart. I am aware that this is not the usual practice.

The ornamental effects can be much more cheaply produced by recessed than by projected work.

MATERIALS—Under this head, cement, by reason of its greater cost and active qualities, stand out pre-eminent. I will limit my remarks under this sub-division to Portland Cement, with the exception of the following observation, viz:

That where rapidity of construction is not a great object and aggregates are unusually cheap, by the use of common lime, with or without some of the cheap native cements, properly handled, work of a good quality and of astonishing cheapness may be made—one part of lime to forty parts of aggregates not being considered too little in some cases.

Portland Cement, a giant from its birth, is striding rapidly along the way of improvement and quality and price, so that formulas of tests that were thought severe a few years ago, would not be considered sufficiently exacting at the present time, to ensure as first class, the cement that would successfully pass them.

The current technical literature teems with methods of testing, so that we can hardly go astray in the selection of a good cement. The three principal requisites for a first class article are as follows:

1st. That it sets or hardens without undue expansion or contraction.

2d. That it be sufficiently finely ground.

3d. That its tensile strength be high.

1st. The cake test. This test is so well known that a description of it here is unnecessary. When time is an object, by the use of hot water, the test may be hastened. Under expert supervision the "boiling test" is by many considered superior to the cake test, but the difficulties in the way of carrying it out, and some uncertainties in the results that yet linger about this new test, prevent me from advocating its substitution for the older test.

2d. The test for fineness. Ninety per cent of the cement should pass through a hundred mesh screen having 10,000 holes to the inch. It would be better to use a yet finer screen for testing but for the difficulty of readily obtaining finer screens. The practice of using coarser screens is to be condemned, because they pass much that is inert. The screenings should feel soft and silky to the touch. The residue on the screen should be hard, black, angular grains. The economic importance of fine grinding has seldom been exaggerated. It is usually unduly disregarded, yet it has been established beyond reasonable doubt, by repeated experiments that the sand like grains of the cement are practically inert and useless. Still, unlike the first qualification, this is an economic question, and the ill effects of coarse grinding, if not apparent in the first test, can be overcome by making due allowance for the coarse portion in proportioning the cement to the aggregate, and then but little harm will follow the use of coarse ground cement in ordinary work.

3d. Tensile Strength: This test is usually and best made by aid of the ordinary testing machine. Several first class cements will now develop tensile strengths of 600 or 700 lbs. per square inch in seven days and whilst this may be too high a standard to insist upon, yet the cement that will not furnish a strength of 450 lbs. in seven days, ought not, in my judgment to be graded as first class, unless it is exceptionally fine ground.

It is desirable, when time will permit, to make the tests with a mixture of one of cement to three of sand, but ordinarily with cements of equal fineness, the relative strength of different brands will remain about the same as under the test with neat cement.

With regard to the aggregates, not so much has been published.

Sufficient interest is not usually taken in these inert materials, which, nevertheless, have a powerful influence upon the character of the concrete, so much so, that a good concrete with a poor cement will sometimes give better results than a good cement with a poor aggregate.

A first class aggregate should be made of a hard, tough rock, free from clay or dirt, and having a rough surface and sharp angles when broken, it should be so graded from the finest grains to the largest pieces admissable in the work it is for, as to give whilst retaining the largest proportion of large sized pieces, the smallest proportion of voids.

If the aggregate is all of one material, the desired aggregation can be determined by weighing a given measure. That proportion which, whilst retaining the maximum amount of large pieces weigh the most, is the best.

If on the other hand, the aggregate is composed of different materials, than that proportion which in a given measure and under the same limitations as just given, will permit of the introduction into the filled measure of the least quantity of water, is the best.

In making such tests the larger the measure, the better: a round measure is better than a square box and it should not contain less than two cubic feet. The material also ought to be shaken down into the measure.

For fireproof work, care should also be taken to avoid such aggregates as contain feldspar and where the possibility of the concrete being subjected to a long continued red heat is sufficiently probable as to be worthy of precautions being taken to meet its effects, limestone also should be rejected from the aggregate.

To those who have studied the matter practically, it is evident that in the large majority of cases the prejudice against the use of the dust and finer particles created in crushing brick or stone, is unfounded, and the practice of prohibiting these and substituting therefore, ordinary sand, is strongly to be condemned. Lieut. Innes found that both limestone dust and ground burnt clay gave stronger results than the purest sand, and tests and works carried out under my supervision, thoroughly corroborate this.

The hardest stone does not necessarily make the best aggregate. For instance, finely crushed granite is for some purposes inferior to finely crushed limestone, although as a rule, the granite is the harder of the two. One reason for this is not hard to seek. Owing to the brittle quality of granite, in crushing, it is not only broken into small pieces, but many of these pieces are so bruised or contused that upon a little pressure being exerted upon them, such for instance as can be applied by the finger or thumb, they will crumble. With limestone and many other softer rocks, by reason of their greater toughness and elasticity, this is not the case.

Again, some stones, as quartz and the like, have surfaces of such smoothness that the adhesion of the cement thereto, is not so good as that between cement and other stone such as basaltic lava, sandstones and the like which when fractured, present a rough surface. Such stones as these latter, usually make first class aggregate. Broken stone, as a general thing, is a better aggregate than gravel. Sometimes a mixture of the two is preferable to either alone. Usually the use of one or the other has to be determined by the economic side of the question and the local supply. When from such causes gravel is selected, its quality can be greatly improved, at small cost, by running it through a crusher that will break the larger pieces as they pass.

The common practice of limiting the maximum size pieces so that they will pass through a three inch ring, is I think, open to question. In massive work stones much larger may advantageously be used, not, however, if the late fashionable practice of "dry concrete" be adhered to.

The experiments carried out by Mr. Elliot C. Clarke tend to show that the presence of a small amount of clay in the concrete is no detriment to its strength, even with as much as ten per cent of the aggregates and cement combined.

In corroboration of this I would instance the Niagara gravel, which whilst it contains a marked quantity of clay, yet makes most excellent concrete.

Having determined the aggregate, the next important question is what is the proper proportion of cement to use for any given work?

With first class materials, in round figures and within the limits of proportions between the cement and the aggregates of from one to four, to one to fifteen, the crushing strength of concrete, when skillfully made, at a month old, may be taken as follows: Multiply the *constant* number 700 by the number representing the proportion of cement used, and divide it by the number representing the amount of aggregate used and it will give the crushing strength in tons per square foot; for instance, a concrete composed of one part of cement to fourteen parts of aggregates should when properly seasoned, have a crushing strength of 700x1-14 50 tons; when three months old the strength will have increased some twenty-five per cent and when twelve months old it will have increased some fifty per cent.

Under this rule a concrete composed of one of cement to fourteen of aggregate would be about on a par with good brick work when a month old and be about fifty per cent stronger when twelve months old. This rule reduces the strength of the concrete to much as the proportion of aggregate is increased, but it is reasonably correct, and quite safe to act upon.

SECTION C. IRON.—The tensile strength of concrete is comparatively little, and by reason of the gradual, though slight shrinkage that takes place in all concrete structures that age in dry situations, should not be relied upon in any important work.

For giving tensile strength to concrete, all modern workers of note now use iron in some form or other.

Angular iron bars, cold twisted, commend themself in many ways, and on this continent they have been more largely used than any other form in concrete-iron construction. The advantages of this cold twisting are many; they may be summed up as follows:

1st. The tensile strength of the iron is largely increased, viz: from twenty to fifty per cent; dependent upon quality of iron used.

2d. Its elongation under strain is considerably lessened, a very important advantage in concrete-iron construction.

3d. It forms a *continuous* key with the concrete, both longitudinally also athwart the bar. The effect of the twist is to *grip* the concrete in every direction, and in fireproof flooring and other work where light construction is desired, the importance of this universal key, is very great, for it counteracts the tendency which a bar otherwise would have to split the concrete along the line of the bar.

4th. The cost of twisting is nominal and the royalty for its use not prohibitory.

In placing these bars, care should be exercised in putting them in the position where they will best exert their strength. They should be strait and laid directly in the line of strain. Any deviation from this rule should be such that the tendency to straighten, which invariably occurs upon the application of the strain, will do little or no damage, such a deviation, for instance as laying a bar of a floor beam with a slight sag in the center. In such a case when the strain takes place, the tendency to straighten would have the effect of thrusting the center of the bar upwards against the downward thrust of the load, and it would be harmless. If on the other hand the bar was laid crowning in the center upon the floor being loaded, the tendency of the bar to straighten would be in the same direction as that of the downward thrust of the floor load and the consequences would be detrimental, if not fatal, to the integrity of the structure.

Concrete is an excellent conservator of iron. Von Emperger states that he knows of a case where iron rods were found perfectly rust free after having been imbedded in concrete below the water level for forty years. (T. A. V. C. E. Vol. 31, P. 447.) W. G. Triest, Jr., states that a wrench that had been buried in concrete twenty-two years had kept its black metallic surface. (T. A. V. C. E. Vol 31, P. 467.)

Referring to some concrete foundations that I built about ten years ago, the President of Starr & Co. writes as follows under date of December 30, 1893: "Though this foundation is on tide land and submerged in salt water more than half way up, there is no rusting or deterioration to the iron. We had occasion to cut through one of the arches and found the iron as stated." A long time ago I imbedded a dozen pieces of hoop iron in as many blocks of concrete, leaving one end of each piece of iron projecting from the surface: After years of exposure to sea air, all the exposed iron had rusted away, or so nearly as to leave but a few soft, jagged needles of rust that were readily removed by the hand. In all cases upon cutting into the blocks I found the iron almost as good as new and from one to two inches from the surface it was invariably so.

SECTION D. WATER.—The water for mixing should be clear, and by preference soft. If it cannot be obtained of ordinary purity, then due allowance should be made for the impurities by an additional quantity of cement.

Sufficient water should be used to bring the mass when thoroughly mixed into a stiff, sticky, tenacious, visceous condition. An error as to the amount of water that should be used in concrete some years ago crept into the professional practice, both of engineers and architects and with suprising rapidity permeated and revolutionized it. I allude to the erroneous theory that only sufficient water should be used to slightly moisten the mass, and hardly enough to render it cohesive in its uncompacted state.

An error seldom takes the hold this did upon a skilled body of men without some apparent justification. The only justification that I have been able to find after considerable research is the fact, that in making briquettes for testing purposes, the use of a minimum quantity of water gives the best results. From this one little isolated fact the generalization was made, that to produce the best results concrete should be mixed in like manner. The fatal flaw in this deduction lies here, viz: that a mixture of cement or of cement and sand, with water, differs radically in conditions when to either of these gravel is added, and differs yet more if broken stone is used.

If cement, or cement and sand is mixed with a large proportion of water, it cannot be compacted by blows or such pressure as can usually be brought to bear, for the mixture would flow from under the tamper. In the latter case, however, where gravel or broken stone are used, with a larger proportion of water, the concrete can be compacted more intimately and closely than with the minimum quantity and under all ordinary conditions, makes a much better concrete. The only exception to this is where smooth, rounded pebbles only, are used with the mortar of the concrete, but this exception does not apply to ordinary gravel, and never applies where broken rock is an ingredient. I allude to this at some length, because the error, although on the wane, is still wide spread.

THIRD, TOOLS.—There is great advantage and economy in mill mixing. Mills can now be obtained at a reasonable figure and should always be used on large works. By their use the cement is more fully utilized, the cost of labor lessened and their work is more uniform and satisfactory in character.

An objection is often made to mill-mixed concrete, viz: that the concrete is injured by over mixing. What is "over mixing?" A very rare *distemper* this. I have never once met with it although I have been actively engaged in concrete construction for thirty-five years. It is never epidemic or fatal, but like vaccination, if present, it would prevent worse and more fatal ailments.

Mr. Spencer Newberry found that a mixture of one of cement to three of sand which when worked for one minute with a trowel developed a tensile strength of sixty-seven pounds in seven days; developed a strength of 240 lbs. in the same period after being worked with a trowel for five minutes, a remarkable result, surely and well worthy of consideration.

Contrary to the almost universal opinion, Portland Cement is improved by a delay between mixing and placing. I have experimented with several brands of Portland Cement and find that they were invariably improved in tensile strength by a delay of from one to four hours between mixing and placing.

In placing concrete it is preferable to have it of one uniform consistency throughout the mass. In cases, however, where it is required that the face of the work should be of a finer grade both grades should be carried on simultaneously, the face grade being placed up against the sheeting or mold a little in advance of the backing by means of a trowel or other convenient tool. In more careful work thin strips of iron about six inches wide and of any lengths convenient, may be set up on edge in the concrete parallel to and at any desirable distance from the face of the mold. The face concrete should then be inserted between the mold face and the iron whilst the backing is placed at the other side thereof. As each layer is put in, the iron is drawn up a few inches, so that when the concrete is tamped, the effect of the tamping is conveyed below the lower edge of the iron, and causes the two grades of concrete to become thoroughly united and monelithic.

The material should in ordinary cases, be placed in thin layers, seldom greatly exceeding in depth the length of the largest aggregates used, and these layers should follow one another sufficiently quickly so that one layer does not become stiff or partially set before the next is upon it.

Flat tampers should not be used for massive work except in the first and last layers of the days work; thin or edged tampers should be employed. Wherever practicable the concrete should be compacted by rolling, in preference to tamping. It is cheaper and much more effective. I am not aware of its being done outside of my own practice, but it is certainly deserving of almost universal use. On large work, steam rollers would be excellent.

It may be accepted as an axiom that concrete cannot be too thoroughly compacted, provided the action is not violent enough to bruise or crush the aggregate.

In massive or deep work, as it proceeds through the day, often the working surface becomes richer in mortar, when, and as often as this occurs, the mixture should be changed by adding thereto more of the larger aggregates free from fine dust, sand or gravel, until this fault is remedied. If on the contrary at any time the surface becomes open for lack of mortar, it should be immediately remedied by putting into the next mixture a lesser quantity of the larger aggregates and not substituting anything in their place.

In a similar way the amount of water used in the mixings should be regulated, changing to more or less as the working surface appears too stiff or too watery. It should be firm under the tamper or roller and yet the mortar should be viscous and unctous to the touch.

The quantity required to produce the condition varies greatly, dependent upon the character of the aggregates whether but slightly or very porous and upon the age and character of the cement and weather.

Great care should be observed in joining the work of one day to that of the next. The last layer should be thoroughly compacted and left with a slight excess of mortar. It should be finished with a level surface which at proper time, as soon as sufficiently stiff, should be patted or stippled with a steel float so as to produce a surface studded thickly with little conical knobs. This surface should be kept wet throughout the night and in the morning immediately before the application of the first layer of fresh concrete, it should be covered with a wash consisting of a mixture of equal measures of Portland Cement and air slacked lime mixed with water to the consistency of thick cream. This covering should be put on in excess and brushed thoroughly back and forth upon the surface, so as to insure a close contact therewith, the excess being swept along just ahead of the fresh concrete until all the surface has been covered, when it should be removed.

When in place the concrete should be kept moist for as long a period of time as possible. When one bears in mind that the chemical action which causes the cement to harden can only take place in the presence of moisture, the importance of keeping the work wet is at once apparent.

In all concrete construction excepting subway and other works where the concrete remains permanently moist, provision should be made for the slow but certain shrinkage that takes place in the concrete as it becomes thoroughly dehydrated. The vertical shrinkage will take care of itself as the weight of the building is in harmony with its movement. The horizontal shrinkage, however, is resisted by the inertia of the structure and the friction of its foundation. There are several ways to direct such shrinkage; that which I have found most feasible is to partially divide the wall at certain intervals, preferably over the windows where there are several in line and to insert across the division a weathering strip of copper or lead.

Where the appearance of a straight division line on the face of the building would be objectional, for instance, on a wall blocked off into ashlar face, I build this division straight and caused it to coincide with the line of the V recesses of the ashler, marking in every other course, and I block out in the intermediate courses, recesses opposite to the division line, and subsequently fill these recesses with concrete ashlers made and seasoned beforehand. By adopting the pattern of alternate long and short ashlers in every other course with long ashlers only in the immediate course meeting at the center line of the short ashlers above and below them, there separate concrete ashlers may be made small and the additional cost of their manufacture will be but trifling.

Apart from the questions of appearance some such division of the surface of a concrete wall is advisable for the two-fold reason: some defining line is needed at the juncture of each day's work at least, and by dividing up the surface by deep recesses into small sections, surface cracking is largely avoided.

In reference to this shrinkage of concrete, lest I should have unnecessarily alarmed you, I will state that in building, the walls of which were 170 feet long and divided thus it was nearly two years before any apparent shrinkage took place, and now it can hardly be observed by a minute examination of the division joints. No outsider, ever though a careful observer, would be likely to perceive any effects of this slight shrinkage when thus directed.

In situations where it is not possible to make shrinkage joints by a liberal use of twisted iron, shrinkage cracks can often be prevented.

The resistance of Portland Cement concrete to the destroying section of fire.

By a misunderstanding, due to a windy interference (Mr. Stone tells me one of my letters was blown out of his office window) I find I am expected to speak on the protection concrete affords iron in case of fire.

There seems to be not so much data on this subject as one would desire. What little there is, however, seems to be in favor of concrete as a fire resistant.

It is generally understood that the artificial stone made with Portland Cement concrete withstood the Chicago fire well. Some years ago the blacksmith's shop at the Benicia Arsenal, California, was burned out, leaving the outer walls standing. This was a brick building with granite door sills, free stone belt courses, with window caps and cornice of Portland Cement concrete. I examined the ruin carefully. The granite was spoiled badly and broken into several pieces; the freestone was badly broken and injured; the brick work was burnt out in the joints in many places, rendering the walls unsuitable, many of the bricks also being spoiled, whilst the concrete window heads which had probably to bear the brunt of the fire on the outside, were but little injured; the surface had softened a trifle and were badly discolored, but they remained whole and strong.

Concrete bricks made of well burnt clinkers and lime (by

a process which converts the lime into silicate of lime and thereby makes it resemble a Portland Cement in character,) withstanding the action of a hot fire and the subsequent sudden cooling by water better than any burnt brick, either common pressed or fire brick that I could obtain in San Francisco, and I presume the same relative result would be obtained from most of the bricks of the several states.

I have repeatedly made the tests so severe that every burnt brick in the dozen or so tested at a time, broke into two or more pieces, whilst under the same test the concrete bricks, beyond discoloring slightly, showed no change.

The thermic expansion of Portland Cement; Bonnicean is quoted as giving the expansion of Portland Cement at 0,00000143 for 1 celsius and iron is given at 0,00000145 which is practically the same.

Hyatt corroborates this in some careful experiments he made with loaded floors submitted to fire in which the concrete iron construction bore a red heat for several hours and a subsequent sudden cooling without injury.

Throughout Europe I believe hollow tile construction is almost unknown. Concrete floors are commonly used in fire proof buildings. The result of tests undertaken in Germany under Government supervision to ascertain the relative value of the ordinary building material, including brick work, places concrete at the head of the list as the best fire resistant.

If due regard is paid to the aggregate used, I think it will be found that Portland Cement concrete is an excellent fire resistant. ERNEST L. RANSOME.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

STERILIZED AIR.

DR. C. F. Buckley's system of aerating water by Sterilized Air—which we illustrated in our February number—has since made rapid progress in the opinions of the medical profession and those interested in health matters and a company has now been incorporated to carry the invention into execution—with such directors as Dr. Luke Robinson, Dr. W. F. McNutt, Dr. Herzstein, Timothy Hopkins, William Greer Harrison and Attorney F. Alleyne Orr.

It is proposed to apply the invention to the water supply of dwellings and public buildings.

The water as taken from the cisterns supplied with this apparatus when subjected to microscopical tests by bacteriologists was found to be absolutely barren of organic life—a condition which the physicians regard as a scientific triumph. This stands to reason, as all the air supply to the water tanks has first to pass through a sterilizing liquid, such as chloride of iron or formaline—which it of the bacilli which convey disease to many thousands in cities—and passing through the drinking water effectually removes from it the deadly microbes. This liquid will remain good for several months so that the cost of maintenance will be very slight while the benefit to the general health of the community will be incalculable.

THEATER FIRE CATASTROPHES AND THEIR PREVENTION.

BY WM. PAUL GERHARD, C. E.

PREVENTION of fire and incidental panic in halls of audience requires that in the planning, construction, interior arrangement and equipment of such buildings certain rules are followed and certain precautions are observed by the architects and engineers of such structures. Of the greatest importance in respect to the enactment of strict building laws are all buildings where a multitude of people are congregated, by day or at night, for worship, education or amusement, such as churches and synagogues, schools and colleges, concert and lecture halls, circuses and theaters. I shall restrict my remarks to theaters, although much of what I shall say applies equally to the other classes of buildings named.

The prevention of theater fire calamities is a subject in which not only firemen but the general public are, or ought to be, much interested.

In the planning and construction of theater buildings, even more than in other buildings, the combined skill, knowledge and talent of both the architect and the engineer are necessary to create a model and safe structure. While the architect works out the best plan on the available site, determines the arrangement of the divisions of the building, decides the mode of construction, designs the elevation, and selects the decorative treatment of the interior, he is assisted by the engineer or by specialists in the various engineering branches in the solution of intricate problems requiring special expert knowledge, such as the construction of difficult foundations, the calculation and the working out of details of all iron constructions, the design of the mechanical or power plant, comprising steam boilers, engines, dynamos, hoisting and general stage machinery, the heating and ventilation of the building, the gas lighting and the electric lighting system, the plumbing, drainage and water supply, the arrangement of the toilet rooms, the general sanitation, and finally the fire protection of the theatre.

THEATRE FIRE STATISTICS.

To begin with, I shall give a few statistics regarding theater fires and their causes. Here we at once encounter much difficulty in gathering and presenting accurate and reliable figures and facts.

There are numerous cases in which a fire breaking out in a theatre, on the stage, in the auditorium or elsewhere, is at once extinguished by the stage hands or by the firemen on duty in the building. Many cases of this kind never become known to the public or to the press, and no accurate record is kept of them. In other instances, again, blind fire alarms

are followed by á panic and often by loss of life. When a fire in a theatre breaks out during the night and destroys the building, the cause of the same often forever afterwards remains a mystery. Distinction must be made between occasional outbreaks of fire which are subdued before they can spread and such fires which completely destroy the building. Those fires which break out during a performance, when the building is crowded with people, are naturally the ones of greatest interest to us. If accompanied, as they unfortunately often are, with loss of life, the number of persons killed and wounded is difficult to ascertain with absolute accuracy, as many perish in the building who are not missed by friends or relatives. The tendency in these cases is usually for the press to exaggerate the number of victims, whereas, on the other hand, the theater officials or the municipality often try to keep the figures below the actual number. The curious mistake is sometimes made of counting both the dead and the wounded in the same figure of victims, obtaining thereby largely increased and incorrect figures. * * * *

Out of a total of 252 theatres, 70, or more than one-fourth of them, are destroyed before they reach an age of five years.

Theatres, therefore, as a rule, do not attain an old age, and Herr Foelsch figures the average age of these 252 theatres as 22 3-4 years. For the United States, the average life of a theatre is said to be only from 11 to 13 years, but it should be remarked that these figures were reached some years ago, before the more strict theatre laws of some of our large cities (New York and Boston, and quite recently Brooklyn and Philadelphia) were enacted.

Recent analytical studies of the question have elicited the fact that there are two periods in the life of theatre buildings when they are most endangered or subject to destruction by fire, namely, one from the time of the construction up to and including the first five years; and, the second period, after the theatre has been opened from 40 to 50 years. This may be explained first, by the fact that in a new theatre the safety appliances, the arrangements for lighting, the scene hoisting devices, the fire protection appliances, are rarely in perfect working order, and the theatre employes have not, as yet, become accustomed to handling them, and are likewise unfamiliar with the rules of management.

The second period of renewed danger is explained by the fact that, after the number of years quoted above, much of the apparatus in a theatre has become worn out or useless, and is not always kept in repair or replaced by new apparatus, and it may also be attributed to the fact that after the lapse of many years, the theatre management and inspection are apt to be less strict, and that often interior alterations are made which unfavorably affects the safety of the building.

From the middle of the last century to our present day, nineteen theatres on the average have been destroyed annually by fire. * * * *

The hour of the day in which theatre fires started is of considerable interest. Out of 289 fires, 56 theaters burned during the day between the 7 A. M. and the afternoon, or 19·4 per cent; 15 theatres burned one hour before beginning of performance, or 5·2 per cent; 36 theatres burned during performance, or 12·4 per cent; 69 theatres burned within two hours after close of performance, 23·9 per cent; 113 theatres burned during the night and before 7 A. M. next morning, or 39·1 per cent.

Later on, when the records of 373 theatre fires were available, Herr Foelsch found this percentage to remain nearly the same, viz.: 19·9, 5·6, 11·6, 22·6, and 40·3 per cent respectively. It will be seen from these figures that the greatest danger from fire to a theatre is during the two hours following a performance, and not during the performance, as would naturally be supposed. The reason for this is partly that, during the performance, a greater watchfulness exists as regards open lights, the sources of heat, and the other usual causes of fire, and partly because many fires, while actually started during a performance, for instance, by carelessness in the use of fireworks or by the use of fire-arms, do not break out at once, but smoulder for a while in the inflammable scenery and woodwork of the stage, and break out during the hours following the performance. The risk from fire immediately before the performance and while the audience is admitted is found to be three times as great as during other hours of the day, which is explained by the fact that at this time the gas flames are lit which illuminate the scenery.

Theatres are, therefore, safest in the day time, the danger is increased threefold during preparations before the performance, because of lighting up, etc., it is reduced during the performance on account of the careful inspection and greater watchfulness on the stage, but is still twice as large as during the day. The danger reaches a maximum (seven times the day risk) during the two hours after the close of the performance, and it remains during the night nearly three and a half times as great as during the day. (Sparks from fireworks or pistol wads may remain glowing for hours after the performance.)

The theatre fires which break out during the performance are often accompanied with loss of life of both spectators and actors, are therefore of particular, though sad interest to us. The life of firemen is often greatly endangered at theatre fires at all hours, and the list of instances where firemen have been killed while engaged in their duty in trying to save burning theatres is quite large.

Herr Foelsch describes in detail thirty-six theatre fires between 1770 and 1877, which began during the performance, and out of this number not less than six were accompanied by appalling loss of life. From 1877 to 1889 six other deplorable theatre calamities have occured. In the twelve years from 1876 to 1888, not less than 1600 people have been killed in the six well known theatre disasters of Brooklyn, Nice, Vienna, Paris, Exeter, and Oporto, nearly all of the victims being dead within ten minutes from the time when the flames and the smoke from the stage reached the auditorium and the galleries.

Dr. Choquet, in his statistics, enumerate a total of 732 theatres destroyed by fire from 1751 to 1885, with a total number of victims, i. e., both killed and wounded, of 6573. This list includes fires where firemen lost their lives in the performance of their duty. Since the beginning of this century 536 theatre fires occured, and from 4500 to 5000 persons had been killed or wounded. * *

CAUSES OF THEATER FIRES.

Before discussing the precautions necessary for prevention, let us inquire briefly into the chief causes of theatre fires and calamities. This study of the causes leading to fires and panics is of the utmost importance, because it enables us to derive therefrom the best practical lessons as to what to do, and what to avoid, to prevent the occurrence of a disaster.

Dr. Choquet, in discussing the causes of theatre fires, divides them into two principal groups, viz.: (1) The intentional causes, or incendiarism; and (2) the accidental

causes. Leaving incendiarism, from malice or other reason, out of consideration, we can distinguish further between:

1. Exterior causes, such as lightning, exposure, dangerous trades carried on in the vicinity of a theatre, bombardment of the city, or riots.

2. Interior causes, viz.: a, on the stage; b, in the auditorium; c, in other parts of the house.

3. Mixed causes, such ss fires originating in living apartments or in stores, or offices, or restaurants, under the same roof with the theatre proper.

Placed in the order of their frequency, we find theatre fires to have their origin:

1. On the stage.

2. In the actors' dressing rooms, in the engine and boiler room, in the cellar, and in the administrative offices.

3. In stores, offices, living apartments, or restaurant kitchens in the theatre.

4. In the auditorium.

5. In outside causes; such as exposure to neighboring

COTTAGE AT MILL VALLEY.

buildings on fire.

In not a few cases the exact cause of a theatre fire remains forever unknown. This is due largely to the rapidity with which the flames spread among the vast mass of combustible material, and to the haste and confusion incident to the fire, particularly when this breaks out during the night time. The best information about causes of theatre fires is derived from those fires which break out during a performance, and which, for obvious reasons, are the most dangerous and often lead to deplorable calamities.

The majority of fires during performances break out on the stage, and are due to open and unprotected or to deficiently protected lights in too close proximity to or amid a mass of unprotected and highly inflammable scenery, draperies, gauze, ropes, and woodwork. Among the numerous other causes I mention the careless lighting of gas lights on the stage, by alcohol lamps on long poles, and sometimes defects in the electric spark or flashlight apparatus, causing escapes of gas or gas explosions; carelessness in the use of lamps on the stage or in the dressing rooms, or exposure of lamps to sudden draughts, careless handling of candle lights in in dressing rooms; alcohol lamps used by actresses for heating hair curling irons in the dressing rooms; the dropping of sparks from the lighting torches on the stage, or on decora-

tions or papers; temporary gas conduits needed on the stage, generally consisting of rubber tubing, becoming leaky, or not being well jointed together, or becoming otherwise damaged and defective; the use of portable open gas burners near movable scenery; the use of defective gas burners and gas fittings, exposed gas pipes damaged by the shifting or carrying about of heavy pieces of scenery or furniture; main gas pipes becoming leaky, and causing escapes of gas; gas explosions in the gas meter vault, or elsewhere; swinging gas brackets setting woodwork or scenery or curtains on fire. Lights other than gas lights are often worse; the upsetting of coal oil or kerosene lamps, and the explosion of such lamps, are fruitful causes of fire.

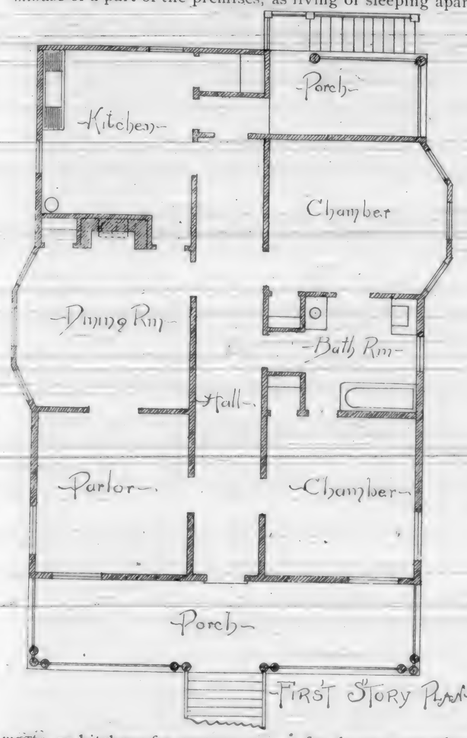
The electric light, finally, although the safest comparatively of all lights, may cause fire by reason of electric light wires not being properly insulated, or being faultily installed.

The careless use of matches, other than safety matches, throwing away of lighted matches, and rats or mice grawing phosphorus matches, in hidden recesses, are among the causes of fires.

The smoking of tobacco, cigars, cigarettes as well as pipes, and the careless throwing away of lighted cigars or cigarettes, in dressing rooms or on the stage, or in the sub-basement; the careless use of the oxy-hydrogen or lime lights; the use of fireworks in spectacular plays calculated to attract the public; the use of red fires, torches, Roman candles, the firing of rockets, are dangerous causes of fire, because a spark often lodges amid scenery and the flames break out during the night following the performance. Sometimes fireworks are prepared for the play in the theatre building, which is a pernicious practice. The representation of fire or conflagrations or actual explosions in the course of the play, the firing of firearms, pistols or guns, with paper wads; the careless handling and use of benzine or turpentine in workshops and costume rooms. The heating apparatus, particularly stoves and furnaces when overheated during extreme cold weather, defective flues, timber near woodwork; floors registers and heat flues; hot ashes; the use of straw or hay on the stage; the careless use of soldering furnaces on tin theatre roofs; gauze dresses of ballet dancers catching fire and in turn setting decorations on fire, non-removal of rubbish and trade refuse; and accumulation of large masses of combustible material, woodwork, canvas, gauze, pasteboard, hemp ropes,

paper with varnish, so-called properties, etc., on the stage; the use of rooms in the theatre, in the basement or in the loft over the auditorium, or even of the stage, as paint or carpenter's shop; the spontaneous combustions of heaps of waste material, of oily rags used for cleaning lamps, or in engine or dynamo room; the action of rays of the sun concentrated by window glass or lenses; carelessness in the necessary quick moving or shifting of inflammable scenery near the innumerable gas lights; the drying up of woodwork on the stage by the heat due to the numerous lights.

As indirect causes of fire, I may lastly mention: An undesirable site, the danger from contiguous or adjacent houses and property, the bad arrangement of the plan, the use of bad materials in construction, defective general system of construction without division into separate fire risks; the misuse of a part of the premises, as living or sleeping apart-



ments, as kitchens for restaurants, or for dangerous trades, or stores; the want of proper fire appliances and of a fire watch; the absence of fire alarm telegraphs, or delays in sending the alarm; frequent changes of watchmen, fire watch and stage hands, and the fact that even men occupying responsible positions grow careless after long time.

The danger of fire in a theatre is also, to some extent, dependent upon the character of the play, whether the plain comedy or drama, or the more elaborate opera, ballet or spectacular play; the arrangement and size of the stage, the method of lighting used, incandescent electric lights being without doubt the safest to use, and the age of the building, the first five years being as found by experience, among the most dangerous.

CAUSES OF PANICS.

Panics may occur in any place of assembly where large crowds of people are congregated, even when there is no outbreak of fire, and sometimes very trifling causes may create terrible panics. It is, in many respects, much more difficult to prevent a panic in a theatre than a fire; and, what is worse, panics may become quite as dangerous in fireproof buildings as in those of a combustible nature.

The immediate causes of a panic may be: A sudden outbreak of fire; a false cry of "fire," the false alarm being given either by some excited or frightened, foolish person in the audience, or sometimes intentionally, as, for instance, by pickpockets; a sudden commotion on the stage or in the audience the sudden appearance of smoke on the stage from burnt fireworks or otherwise; the unannounced darkening of the house; a sudden extra pressure of gas at the footlights, causing the flames to flare up unduly; the sudden extinguishment of the electric light; a fire alarm in the neighborhood, or even only the rattling noise of passing fire engines; the reflection of a fire in the neighborhood of the theatre; a thunder storm or stroke of lightning; persons fainting in the theatre; horses on the stage becoming frightened and shying, or falling into the orchestra pit and others.

Features in the construction and arrangement of a theatre which may indirectly lead to a panic are: too few exits; various exit passages crossing each other; obstructed aisles or corridors; too narrow stairs; winding stairs; doors opening inward; doors opening in dark corridors, and safety exits kept under lock and key.

The best way to prevent panics is to give to the theatregoers a feeling of security by planning a very ample number of wide exits, so as to enable the quick add quiet emptying of the house, by arranging easy stairs, by providing at least two separate stairs for each of the tiers, by arranging a large number of stairs for the visitors in the gallery, by installing the electric light in the theatre, particularly on the stage, and providing also auxiliary lights in the corridors, stairs and exits. Furthermore, by making it known to the theatregoers that safety appliances are provided in abundance, chief among these being large stage ventilators, a fireproof curtain, fire walls dividing the stage and the auditorium, the fireproof treatment of scenery and of woodwork on the stage, also the putting up and keeping in readiness for instant use in an emergency of plenty of fire extinguishing and life saving appliances, including an automatic sprinkler system on the stage, which must be kept in good working order. Finally, by informing the public that a striet fire watch is kept, that the theatre is frequently inspected and by issuing and publishing stringent regulations referring to theatre management.

DANGERS TO HUMAN LIFE.

To further understand correctly the subject of theatre fire catastrophes, let us consider briefly the various ways in which human life is endangered in a theatre fire or panic.

At the outset I will state that it is an error to suppose that the flames are the chief cause of death in theatre fire catastrophes. The lessons of all theatre calamities point to the fact that it is not the fire, but the smoke, the fire gases and the intense heat incident to the fire, and on the other hand, the mad rush in a panic, which kill most people. Indeed, the majority of people, particularly in the upper galleries, are suffocated or trampled to death before the fire reaches them. In many of the theatre conflagrations cited above the bodies of victims were found perfectly intact and either in a sitting position or else fallen upon the floor dead, without the flames ever having reached them.

The lives of people in theatres, whether spectators, actors, musicians, choras singers, ballet girls or stage hands, are, therefore, endangered:

1. By smoke, fire gases, heat, asphyxia, exhaustion.

2. By fire burns.

3. By jams, knocking over, falling down stairs, trampling, crush.

4. By direct shock or fright.

5. By accidents, such as the falling of the central chandelier.

These various causes may result in (a) almost instantaneous death, (b) mortal injuries (c) injuries resulting in permanent bodily disablement; (d) temporary illness and recovery.

The long list of theatres destroyed by fires breaking out during a performance, and the numerous instances of fires breaking out during these hours, but which are put out be-

fore spreading, are proof sufficient that the dangers spoken of are constantly threatening the theatre-going public.

To sum up, chief among the causes to which serious calamities are due are open lights and inflammable scenery: defects in gas lighting and gas piping; defective gas lamps; faulty construction of the building, deficient exits and absence of a fireproof curtain, or where same is provided, curtain not used or out of order, absence of fire extinguishing appliances or lack of water under fire pressure: auxiliary lights in corridors, exits and stairs not provided, absence of smoke ventilator over the stage, accumulation of inflammable scenery, and bad management in the theatre.—*Scientific American.*

THE REGULAR MONTHLY MEETING OF THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE regular monthly meeting of the San Francisco Chapter of the American Institute of Architects was held Friday afternoon, November 9, 1894.

The application of Mr. Ernest A. Coxhead for fellow membership, was received and referred to the Executive Committee to take the usual course.

A communication was received from the Chamber of Commerce, requesting the Chapter to appoint a committee of ten to meet other public organizations to consider the subject of the prompt construction of the Nicaragua Canal. The President appointed the following members to serve on the said committee:—Seth Babson, G. W. Percy, Geo. H. Sanders, Albert Pissis, Willis Polk, H. T. Bestor, B. E. Henriksen, John M. Curtis, Frank Shea, Oliver Everett; and the Chapter instructed them to assure the Chamber of Commerce of its sincere conviction of the necessity of the Canal and its further conviction that the Canal should be built by the Government of the United States of America, and paid for by the issue of bonds, and that it would be against public policy and a proof that the Government had not gained wisdom from experience, should the Government endorse any enterprise controlled by private capital.

A communication was received from the Southern California Chapter of the American Institute of Architects in regard to introducing a bill to the coming legislature, regulating the practice of architecture in this State.

ANNUAL MEETING OF STOCKHOLDERS.

THE Annual Meeting of the Stockholders of the CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY was held on the afternoon of the seventh of November.

The reports of officers showed that the company had about held its own during the past year, in spite of the depressed condition of the building and business interests.

The old board of Directors was re-elected.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

PAROLE EVIDENCE AS TO CONSTRUCTION OF CONTRACT.—In an action on a written contract to "do all the mason work and furnish all the building stone" for a building at a certain price, the estimate to "include all brick work," parole evidence is admissible to show that defendant was to furnish the bricks.

Streppone v. Lennon, Court of Appeals of New York, 37 N. E. Rep. 638.

AGREEMENT TO ARBITRATE FOR CHANGES IN BUILDING CONTRACT.—Where a building contract stipulated that if alterations were ordered, and their value disputed, they should be valued by two competent persons, and these might chose an umpire, whose decisions should be final. The builder could not sue for extras without an attempt to arbitrate. Since the contract provided for alterations which might reduce the contract price, the last installment of said price, which was to be retained by the owner till thirty-five days after the work was completed, to cover liens of damages would be subject to reduction, and could not be recovered until its amount was fixed by the arbitration provided for.

Ball v. Aoud, Supreme Court of Oregon, 37 Pac. Rep. 70.

INSUFFICIENCY OF NOTICE OF CLAIM FOR MECHANIC'S LIEN.—The statute, requires the statement for a mechanic's lien to be essentially true. A notice of lien was insufficient where it stated that the claim was for labor and materials, while only labor was furnished. Where the complaint and claim of lien states that the work is done for an agreed price, and the evidence shows no price was agreed on, there is a fatal variance.

Wagner v. Hanson, Supreme Court of California, 37 Pac. Rep. 195.

WHEN ACTION AGAINST CONTRACTOR WILL NOT LIE.—No action lies against a contractor for failure to comply with a contract which provides that in case of noncompliance the owner may annul such contract, and forfeit the unpaid part of the work.

O'Connor v. Henderson Bridge Company, Court of Appeals of Kentucky, 27 S. W. Rep. 252.

WHEN RIGHT TO ANNUL CONTRACT IS LOST.—The right to annul a contract for non-performance of its terms by the contractors, is lost where the employers are in default, by failure to estimate and pay for work done and materials furnished by the contractors.

O'Connor v. Henderson Bridge Co., Court of Appeals of Kentucky, 27 S. W. Rep. 252.

PROCEEDINGS TO PERFECT MECHANIC'S LIEN.—Under the statutes, providing that original contractors, journeymen, day laborers, or other persons seeking a lien shall file their contracts, but if such journeymen, day laborer, or other person have no written contract, it shall be sufficient to file a verified account of his claim, an original contractor may file a verified account to secure a lien, when he has no written contract.

Whiteselle v. Texas Loan Agency, Court of Civil Appeals of Texas, 27 S. W. Rep. 309.

WHERE A SALE TO FORECLOSE A MECHANIC'S LIEN IS VOID.—The Supreme Court of Illinois holds, that where a sale to foreclose a mechanic's lien is void for want of jurisdiction, judgment creditors cannot obtain any rights by redeeming from such sale. The fact that a judgment creditor has treated such a sale as valid, by attempting to redeem under it, does not estop him from afterwards asserting its validity, since he could not thereby have deceived any one, the want of juridiction being a defect patent to all.

Holcomb v. Boynton, 37 N. E. Rep. 1031.

WHERE A CONTRACTOR AGREES THAT PART OF THE SUM SHALL BE PAID BY THE OWNER.—The appellate Court of Indiana, holds, that where a contractor agrees with his material men that part of the sum due him for building a house shall be paid by the owner to the material men, and the owner assents, and the material men release the contractor from liability, the contractor is not a necessary part to an action by the material men to foreclose a lien on the house.

Leeper v. Myers, 37 N. E. Rep. 1070.

LIABILITY FOR NEGLIGENCE IN EXCAVATION.—Where a building is being construction on a city lot, and the excavation in the sidewalk is not protected as required by ordinance, the owner of lots is liable to persons by falling therein, though the work is being done by an independent contractor.

Spence v. Schultz, Supreme Court of California, 37 Pac. Rep. 220.

BUSINESS MOSAICS.

Portland Cement.—The well-known brands "Josson," and "North" can be had by applying to J. W. Grace & Co., 203 California street, San Francisco. If the increased use of cement continues at the present rate, we may be said to be living in the cement age.

There is a big fat girl clerk in a confectionery store on Madison street. "What do you weigh?" a fresh young printer asked her. "Candy," she sweetly replied.—*Clay Record.*

W. & J. Sloane & Co., 641–647 Market street are the ones to call upon if you want style, price and quality, as this is the headquarters for carpets, furniture and upholstery. If you have any doubts of this fact, call and examine their stock and prices and you will be sure this assertion is right.

Fresh AIR BOY—"Mister, do you have to buy chewing gum for all those cows?"—*Clay Record.*

Dunham, Carrigan & Hayden Co., 17 and 19 Beale street, San Francisco, have an illustration of their American Sliding Door Hanger, (on page ix of this journal) for which they claim unusual advantages; trackless, no wheels to bind, noiseless, while the doors are easily adjusted. What more is wanted in a hanger is hard to tell—architects should investigate the claim and orders would doubtless follow.

Editor's SON—"Papa, what do the letters 'SINNED' spell?" EDITOR—"Well, my boy, transpose 'em and they spell the name of the merchant who refuses to advertise during the dull season."—*Detroit Herald.*

If you send to Edward B. Hindes, 411 Mission street, San Francisco, Cal., he will forward you a catalogue and price list of Hill's Patent Inside Sliding Blinds, Perfection Window Screens, Latest Inproved Venetian Blinds, Patent Self Coiling Burglar and Fire Proof Steel Shutters and Rolling Wood Partitions.

Collector—"Say look here, I'm tired of calling here about this bill." THE EDITOR—"Well, I'm glad to hear it.—*Call.*

Rischmuller's Door Opener and Closer. We have had occasion before now, to recommend this very efficient door opener, but as one cannot have too much of a good thing, we take pleasure in repeating that if you want the best in the market, leave your orders with Geo. Rischmuller, 320 Nineteenth street, San Francisco.

A Colchester paper avers that a hotel in that place has a cook so good looking that she mashes the potatoes by looking at them.

The J. L. Mott Iron Works, New York, Boston, Chicago, St. Louis and San Francisco, are so well and favorably known that any announcement of improvement in their line of goods is sure of attracting attention. We call attention to their advertisement on page v of this journal of the Water Closet Range fully illustrated. It certainly appears a great improvement in a sanitary point of view. Mr. M. S. James, Pacific Coast Representative, room 35 Flood building, San Francisco.

A. Steiger Sons, nothwithstanding the great fire, are still on deck as manufacturers of Architectural Terra Cotta, can be found at San Jose, California, P. O. Box 1025; tele. 5253. Anything including stoneware, flue linings, colored bricks, vases and fire bricks, salt glazed sewer pipe, chimney pipe and tops, drain tile, etc., will be found at their headquarters; in addition, you will be sure of fair treatment, and can depart upon getting what you order at fair prices.

"This," said the batchelor, as he paid for sewing on a button, "is what is meant by a single tax."—*Cleveland Plain Dealer.*

Any thing in the way of gold, silver, nickel and copper plating, as well as copper plating of every description of architectural iron and steel work, is done and done well at the San Francisco Plating Works, 653–655 Mission street, San Francisco. E. G. Denniston, proprietor.

"And so he has succeeded in getting engaged to the heiress?" "Yes, he is now her affianced."—*Washington Starr.*

Pacific American Decorating Company manufacturers of Stained and Art Glass by the hygroscopic process by which landscapes, marine views, photographs of persons, animals, etc., are reproduced; we wonder the amature photographers do not make a rush to this establishment to reproduce the result of their labors in the field.

Wife (returning from the seaside)—"What you have never opened my letters?" HUSBAND—No, but I sent you money every time one came."—*Humoristiche Blaetter.*

The San Francisco Gas Lighting Company.—The Gas stove department of this company have at their show room, 26 Post street, gas cooking and heating stoves, gas ranges and open fires, if you call you can see them in operation—do not fail to do so if you wish to be comfortable these cold evenings. You will find that the cost of gas is not the great objection that is sometimes urged against their use. The company claim that the heat obtained in this manner is cheaper than by coal at eight dollars a ton. One word to the ladies that do their own house work, and are aware "that time is money," try it and you will never do without this great convenience, save the annoyance of dust, ashes and smoke.

McManus—"Good mornin', sor. Can me an' Clinchy go up on yure roof an' see the Orangemin's percission go by?" SLATTERY—"Phy don't yez go t' th' place phere yez buys yure drinks?" MCMANUS—"Sure yure chimney has double th' bricks in it, sor."—*Call.*

Mann's Patent Chimneys are endorsed by the Board of Supervisors and recommended for general use by architects, fire wardens, insurance agents and owners. Schuster Bros., 306 Sutter street, between Grant Ave. and Stockton streets, are the agents, also agents for the Richmond Ranges, Richmond Hot Air Furnaces and Radiators.

CITY BUILDING NEWS.

Baker and Grove. Steam heating plant; owners, Boys and Girls Aid Society; contractors, A. Bannsdiger & Co.; signed, Nov. 1; filed, Nov. 12; cost $2162.

Belvedere near Waller. To build; owner, Frank B. Pritchard; contractor, W. W. Redmall; signed, Oct. 24; filed, Oct. 24; cost $1750.

Buchanan and Birch. Two-story stable; owner, Mrs. T. H. Van Huys; architect, Wright & Sanders; contractors, Liebert & Hoffman; signed, Nov. 7; filed, Nov. 10; cost $30,790.

Buchanan and Birch. Plumbing; owner, Mrs. T. H. Van Huys; architects, Wright & Sanders; contractor, W. F. Wilson, signed, Nov. 7; filed, Nov. 10; cost $2298.

California and Larkin. Plumbing; owner, Henry Kahn; architect, J. M. Lyon; contractors, Ickelheimer & Bro.; signed, Nov. 2; filed, Nov. 8; cost $2650.

California and Larkin. Alterations; owner, Henry Kahn; architect, J. M. Lyon; contractors, Morrison & Cook; signed, Nov. 1; filed, Nov. 8; cost $7000.

California and Jones. All work to complete a nine-story brick and stone house; owner, W. H. Eastland; architects, Bugbee & Gash; contractor, L. N. Fletcher; signed, Oct. 27; filed, Oct. 29; cost $200,000.

California and Jones. Carpenter work; owner, W Eastland; architects, Bugbee & Gash; contractor, C. Chisholm; signed, Sept. 25; filed, Oct. 31; cost $5665.

California and Jones. Exterior stone carving; owner, W. H. Eastland; architects, Bugbee & Gash; contractor, Ludwig Ochiman; signed, Oct. 16; filed, Oct. 30; cost $2000.

California and Jones. Excavations, concrete, etc.; owner, W. H. Eastland; architects, Bugbee & Gash; contractors, Fletcher & Jordan; sub-contractor, S. Giletti; signed, Oct. 27; filed, Oct. 30; cost $31,260.

California and Jones. Grading; owner, W. H. Eastland; architects, Bugbee & Gash; contractor, Secondo Giletti; sub-contractor, John Tuttle; signed, Oct. 31; filed, Nov. 1; cost $1425.

Clement and 2d Ave. To build; owner, P. Filippini; architect, A. W. Smith; contractor, A. W. Goss; signed, Oct. 10; filed, Oct. 19; cost $5660.

Clement and 7th Ave. One-story frame; owner, E. D. Allen; contractor, B. I. Taylor; signed, Nov. 9; filed, Nov. 10; cost $800.

Clay near Laguna. Alterations and reconstruction; owner, Annie L. Wallace; architect, S. Newsom; contractor, W. H. Wickersham; signed, Nov. 2; filed, Nov. 9; cost $2689.

Eddy near Steiner. Alterations; owner, Mrs. Mary Birchell; architect, C. M. Rousseau; contractors, Miran & Gardener; signed, Nov. 1; filed, Nov. 7; cost $2300.

Eighth Ave. near Clement. To build; owner, John R. Billington; architect, H. J. Kraetzer; contractor, A. L. Jacobson; signed, Oct. 30; filed, Oct. 31; cost $1475.

Ellis near Mason. Electric Light Wiring; owner, Maurice Cassey; architect, H. A. Schultz; contractors, Edison Light Company; signed, Oct. 27; filed, Nov. 1; cost $1502.25.

Florida and 24th. To build and addition; owner, Mrs Katherine Warz; architects, Martens & Coffey; contractor, John Foster; signed, Oct. 18; filed, Oct. 18; cost $2250.

Frederick near Cole. To build; owner, Robert Wannemacher; architect, Emil John; contractors, Schutt & Kreeker; signed, Oct. 19; filed, Oct. 23; cost $1860.

Fulton near Lyon. To build; owner, Henry Eggeling; architect, C. Zwierlein; contractor, Casper Zwierlein; signed, Nov. 5; filed, Nov. 7; cost $6400.

Fourth near Stevenson. To build brick building; owner, Chas. W. Stein; contractors, Liebert & Hoffman; signed, Nov. 5; filed, Nov. 7; cost $4900.

Glover near Jones. Alterations; owner, M. Piche; contractor, Jean Solanave; signed, Nov. 5; filed, Nov. 8; cost $1225.

Hartford near 18th. Cottage; owner, Geo. Pollock; architects, Occidental Building Association; contractor, Chas. Delmas; signed, Oct. 20; filed, Oct. 20; cost $1200.

Howard near Beale. Two-story brick; owner, W. F. Whittier; architects, Percy & Hamilton; contractors, Riley & Loane; signed, Oct. 30; filed, Oct. 30; cost $5865.

Heyman Ave. near California Ave. Cottage; owner, P. Broderick; contractor, John Gillegley; signed, Oct. 31; filed, Oct. 31; cost $1280.

Jackson near Scott. Plastering; owner, Augusta K. Gibbs; architect, W. W. Polk; contractor, J. R. Tobin; signed, Oct. 19; filed, Oct. 22; cost $1650.

Jackson near Central Ave. Frame residence; owner, W. J. D. Duisenberg; architect, E. G. Duisenberg; contractor, F. G. Kromnick; signed, Oct. 22; filed, Oct. 24; cost $3870.

Jackson and Laguna. Brick store and dwelling; owner, W. F. Whittier; architect, E. R. Swain; contractor, O. E. Brady; signed, Oct. 12; filed, Oct. 13; cost $45,000;

Jackson and Laguna. Carpenter work, etc.; owner, W. F. Whittier; architect E. C. Swain; contractor, C. Chisholm.

Jackson near Broderick. To build; owner, Fannie Hyman; architect, W. H. Lillie; contractor, P. T. Pottinger; signed, Oct. 30; filed, Nov. 1; cost $3513.

Liberty near Dolores. Cottage; owner, T. Griffith; architect, D. Stanley; contractor, H. Foote; cost $3500.

Market bet. 5th and 6th. Marble wainscoting, etc.; owner, Miss Emma Spreckles; architects, Reid Bros.; contractors, Ruffino & Bianchi; signed, Oct. 20; filed, Nov. 7; cost $21,349.25.

Market bet. 5th and 6th. Asphalt roofing work; owner, Miss Emma Spreckles; architects, Reid Bros.; contractor, R. Flaherty; signed, Oct. 17; filed, Nov. 7; cost $1233.

Market bet. 5th and 6th. Electric and telephone wiring; owner, Miss Emma Spreckles; architects, Reed Bros.; contractor, California Electric Works; signed, Oct. 6; filed, Nov. 7; cost $2849.

Mission near 29. To build; owner, W. J. Rustemeyer; architect, H. Geilfuss; contractor, H. Behrens; signed, Nov. 5; filed, Nov. 7; cost $3000.

Morton bet. Grant Ave. and Stockton. Brick to build; owner, Mrs. Rosalie Fawre; architect, C. M. Rousseau; contractor, A. W. Lawson; signed, Oct. 17; filed, Oct. 19; cost $2775.

McAllister and Devisadero. To build; owner, Theodore Dierks; architect, C. M. Rousseau; contractors, Dean & Worden; signed, Oct. 20; filed, Oct. 23; cost $3980.

Oak and Stiner. To build; owner, Carleta A. Logan; architect, W. H. Lillie; contractor, Moore & Cameron; signed, Oct. 19; filed, Oct. 22; cost $3272.

O'Farrell near Stockton. Elevator work; owners, Gutzeit & Malfanti; architect, Pissis & Moore; contractor, A. J. McNeull; signed, Oct. 10; filed, Oct. 20; cost $5150.

O'Farrell near Steiner. Two flats; owner, Mrs. W. M. Rodrigue; architect, J. H. Littlefield; contractors, Morrison & Cook; signed, Oct. 23; filed, Oct. 26; cost $2938.

Pierce near Fulton. To build; owner, Wm. McCormick; architect, A. J. Barnett; contractors, Ogle & Smith; signed, Oct. 22; filed, Oct. 23; cost $6700.

Polk near California. To build; owner, M. B. Bradbury; architect, Fred Woods; contractor, R. O. Chandler; cost $5500.

Post near Stockton. Alterations and additions; owner, A. Aronson; architect, C. R. Wilson; contractor, T. Sullivan; signed, Oct. 16; filed, Oct. 18; cost $1963.

Post near Devisadero. To build; owner, Thos. Lacoste; architect, J. Godart; contractor, L. Cuneo; signed, Oct. 23; filed, Oct. 24; cost $2700.

Post near Larkin. To build; owner, Charlotte Drew; architect, Samuel Drew; contractor, J. J. Manseau; signed, Oct. 27; filed, Oct. 27; cost $ 0.0.

Second Ave. near Point Lobos. Alterations; owner, City of San Francisco; contractor, J. K. Delmas; cost $1838.

Taylor and Valparaiso. Alterations and additions; owner, William E. Wassell; contractor, H. T. Greib; signed, Oct. 19; filed, Oct. 20; cost $1900.

Twenty-fourth near Vicksburg. Alterations and attitions; owner, J. M. Swales; contractor, J. H. Rothgerber; signed, Oct. 18; filed, Oct. 18; cost $1208.

Twenty-third near Guerrero. Three two-story buildings; owner, E. Pognter; architects, Townsend & Wyneken; contractor, W. Lidden; signed, Oct. 25; filed, Oct. 27; cost $10,575.

Turk and Scott. To build; owner, R. F. Morgan; architects, Shea & Shea; contractor, P. Carmouche; signed, Nov. 9; filed, Nov. 10; cost $1552.

Vallejo and Gough. To build; owner, William H. Wharff; architect, Wm. H. Wharff; contractor, F. W. Maurice; signed, Oct. 20; filed, Oct. 20; cost $3160.

Vallejo near Laguna. Double two-story frame; owner, Chas. E. Lipp; architect, Oliver Everett; contractors, Dean & Worden; signed, Oct. 24; filed, Oct. 24; cost $9000.

Van Ness near Union. To build; owner, Virginia Barcle; architects, Townsend & Wyneken; contractor, L. Cuneo; signed, Oct. 29; filed, Oct. 31; cost $3295.

Van Ness Ave. and Vallejo. Additions and alterations; owners, H. & H. E. Law; architect, J. B. Mathiesen; contractor, C. M. Depew; signed, Nov. 8; filed, Nov. 10; cost $5800.

Valencia near Liberty. Plumbing; owner, J. B. F. Davis; architect, J. C. Newsom; contractors, Marian & Gordan; signed, Sept. 26; filed, Nov. 2; cost $974.

Waller near Webster. To build; owner, John M. Nolan; architect, A. J. Barnett; contractors, Stevens & Vodden; signed, Oct. 24; filed, Oct. 25; cost $3078.

Washington near Scott. To build; owner, S. J. Schuyler; architect, F. W. Wood; contractor, D. Currie; signed, Nov. 9; filed, Nov. 10; cost $4198.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

SOME years ago the Legislature of this State passed a mechanics' lien law for the protection of laborers, material men and sub-contractors. The main feature was a very laudable one. It provided that all contracts over one thousand dollars should be matters of public record, to give all parties furnishing labor and materials the opportunity of judging whether or not the contractor was to receive a sufficient compensation for the work to be done, so that they could decide in an intelligent manner whether it would be safe or not to furnish labor and materials to the contractor. The penalty for non-compliance on the part of the owner being to render the latter responsible for all bills not settled by the contractor.

This worked very satisfactorily at first, but after awhile some creditors of a contractor who had failed to pay dollar for dollar in settling up on some building, raised the technicality that the articles of agreement only had been filed in the recorder's office, and as the architect's plans and specifications had been made a part of the contract, and had not been filed therewith, the contract was therefor totally void. The courts held the point well taken, and decided also that the plans and specifications should be filed to make the record complete, and give the interested parties all the information the law intended.

As a matter of fact, it is universally conceded that in actual practice this information is obtained by the interested parties, from the contractor or architect direct, and not one time in ten thousand is it obtained from the records, consequently as a matter of fact the filing of the plans and specifications at the City Hall is a useless formality, and being a very expensive and troublesome one, the legislature passed an amendment to the law, making it optional to file either the contract, or a memorandum thereof stating the five main points of the contract, one of them being "a statement of the general character of the work to be done."

The Supreme Court has recently decided that a memorandum, to comply with this clause, must contain plans and specifications; in other words that a "statement of the general character of the work to be done" must contain a detailed description of every one of the thousand and one minutiæ that enter into a full description of a building. To a non-judicial mind, this appears to be a rather absurd proposition. Suppose an owner is favorably impressed with a building put up by a carpenter by days work, without either plans or specifications, and that he contracts to have a

similar house built for himself by the same carpenter. Will the learned Judges maintain that the first building would have to be filed with the Recorder to make the contract valid? and would it be illegal to take the natural course of examining the building to find out what was to be done under the contract?

This last decision by the Supreme Court renders the amendment to the lien law concerning a memorandum of no more force and effect than if it had never been passed, and the plain intention of the amendment has been purposely ignored or misunderstood.

We incline to the latter opinion as the more probable. Are the learned Judges aware that it is customary for an architect, during the construction of a building, to give personal directions as to the method of executing the work, and to frequently illustrate his meaning, by drawings, or details, as they are called, which are made as required by the progress of the work? Now as these personal directions and detail drawings are mentioned in the contract and are consequently a part thereof, it logically follows, according to the learned judges decisions, that they should also be filed with the County Recorder, to make the contract legal; not only filed with the County Recorder, but filed *before the work is begun*, to comply with the requirements of the law.

WOMEN AS ARCHITECTS.

THERE are two very interesting girls in New York, says the *Examiner*, Miss Alice Hands and Miss Mary Gannon, whose plans have been accepted for the Florence Sanitarium in San Francisco.

The projectors of the hospital are Dr. Florence Saltonstall and Dr. James W. Hall. It will be a private institution, conducted under the care of its founders. The site chosen for it is at the corner of Laguna street and Broadway, on an eminence overlooking the Golden Gate.

The building will be of wood and the style of architecture will be colonial. It will be three stories in height with a basement and the cost of the building is estimated at about $25,000. It will have accomodations for at least forty patients. There are to be two wards with fifteen beds each and ten private rooms. The operating room, with sterilizing and etherizing rooms opening off, are most complete as to arrangement and size. An immense elevator is in the middle of the central building which admit of patients being transferred from one floor to another in their beds.

Dr. Saltonstall has been quietly going ahead with the preparations for the construction of the sanitarium. None but the most modern and improved building for the purpose would satisfy her, and the Architectural League was appealed to. The requirements of the sanitarium were briefly submitted to architects of ability and who stood high in the profession, and competitive designs were submitted. These were passed upon by a board of competent judges, and the two young ladies, Miss Hands and Miss Gannon, were the choice. They were the first women to have work hung in the Architectural League, and they will be the first of their sex to be the architects of a building of any prominence, or perhaps of any kind, in San Francisco.

Art students in New York can be said no longer to be uncommon. Their flowing capes and Tam O'Shanter caps make our life picturesque in a dozen different localities that seek to be little Latin quarters. But of full-fledged architects, just budding into womanhood, there are few such as these girls are.

Miss Hands is twenty-one years of age and Miss Gannon only a little older. Miss Hands lives with her parents in New York, where she has always lived, and Miss Gannon whose home is in Bethlehem, Pa., boards a little distance away from the friend from whom she is nearly inseparable. Neither is at all masculine, nor yet obtrusively or "picturesquely" feminine. They are simple-mannered, well-bred girls, with oval faces, thoughtful dark eyes and brown hair that has not yet lost its childish softness. Their honors as successful architects they bear meekly, although they have achieved enough of fame and profit to turn heads less bent on study and faithful work. Rarely do they talk, even between themselves, of what they feel life has in store for them, but Miss Hands this evening, coming in pink and flushed from a dancing class, chattered like a magpie of how it has all come about.

"When I left school," she said, "I went to the Young Women's Christian Association and began lessons in mechanical drawing. Just why I wanted to learn architecture I do not know. No one in the family had ever chosen that profession, and how much I really know about the requirements of it I cannot remember now. I just decided that way, and I have never regretted it.

"I did my best there, but when Mrs. Dunlap Hopkins opened the school for applied design I saw at once how much better that was, and I went there as soon as I could get in—a month, in fact, after it opened. There are several departments, you know: wall-paper, carpets, silks, architecture and water-colors, taught by Paul de Longpere. Sometimes when I came home and told my people how the girls in the wall-paper department had been out that afternoon and had sold $50 and even $60 and $70 worth of their designs they used to speak as if I had made a mistake in not choosing designing.

SHE LOVED HER WORK.

"But I was satisfied. I loved it. I loved the classical forms and traditions of achitecture and I studied. Miss Gannon had been in an architect's office in Bethlehem, and had many bad tricks of modern architecture to unlearn, but she is clever and it is all right now.

"We studied two years, and last June I had my diploma. Mrs. Hopkins is the dearest as well as the cleverest woman in the world, and she gave us the use of rooms in the school building during the summer, and then we went to work to enter such competitions as we could. We made plans for five school-house ranging up to $8,000 in value and we secured all five. We entered for the Florence Sanitarium and, as you know, secured that, but we certainly worked for it, for I visited every one of the best arranged hospitals in the city; the Presbyterian, the Cancer, the Flower and all, amalgamated their points of excellence as best I could and made the plans accordingly.

"A California millionaire, whose name I cannot give, has commissioned us to build for him a summer house after that in which the Czar died in Livadia. We have made plans for a house for the Reverend Mr. Davenport and we entered in the Atlantic Exposition competition. Though we have lost that, other work is promised us, including a church at Toronto and, altogether, we have been very busy since June

ONE DREADFUL DISAPPOINTMENT.

"The Atlanta Exposition Building was a dreadful disappointment to us, but I think Mrs. Hopkins is not going to let the award go as it has started without at least letting the Judges know that she is aware of the processes by which the award was made.

"The loveliest thing about our school and the privileges that the three hundred scholars enjoy is the possibility of earning money. We get every cent that the work brings in, and we get our five per cent and four per cent for the work just as men architects do. Not a cent goes to the school, which is self-supporting, but it comes to us, so that we have had a financial success as well as merely the comfort of having our plans accepted.

"I think it is a noble profession for women—one in which if they will only hold to the prices as women competing with men should, there is every reason for their making handsome incomes.

"We are staying still at the school, though we get no instruction there now. When work gets too heavy for us to stay there for lack of room we shall take an office and put out our firm shingle."

Miss Gannon equally enthusiastic, speaks in a charming older-sister manner of the unity with which she and Miss Hands work together—with words which are full of wisdom for a young professional woman.

"We work at the same desk; each makes her own original sketch, and from these we work out together one which has as few of the faults and as many of the good points as we can. It is pretty work; it is fascinating work; it is profitable, and I think it is noble in that every one who is placing higher ideals of art before the people is doing what is great and good."

THEATRE FIRE CATASTROPHES AND THEIR PREVENTION.

BY WM. PAUL GERHARD, C. E.

[*Continued from November number.*]

WE have now gained a sufficiently clear understanding of the causes of fires and panics in theatres to enable us to turn to the second part of our subject, viz: The prevention of theatre fire catastrophes:

The principal measures for the prevention of theatre fire disasters should have in view, first, the safety of the people in the theatre, whether spectators, actors, stage hands or firemen on duty, and next, the safety of the building. The safety of the people comes first in the order of importance. The building may even burn down, but the public must under all circumstances have facilities for saving themselves. All efforts must be directed towards making the play-goers, the players and the theatre employes safe. All manner of danger arising from a fire or from a panic, caused by a real or false fire alarm, should be averted, and appliances for saving life should be kept within reach. Next, the building should be made structurally safe, and efficient means for fire extinguishment should be provided, thus preventing the immense fire loss usually caused by a theatre conflagration.

The safety measures, to be briefly considered hereafter, may be divided into four principal groups, viz:

a. Measures to prevent outbreaks of fire, which include rules of theatre management, regular systems of inspection; considerations of plan, size, location and construction of a theatre, height of building and number of galleries, and structural details.

b. Measures to localize fires and to prevent their spreading, if in spite of precautions they do break out. Under this heading would come the fire walls, the fire doors, the fire curtain, the floor and roof construction, and the division of the theatre, horizontally and vertically, into many separate fire risks.

c. Measures to insure the safety of the spectators and of the stage people, to prevent injuries resulting from a jam or crush and a panic, the suffocation by smoke and death by fire. This group includes ample means for safe, easy and quick exit from the burning building and relates to such subjects as seats, aisles, passages, doors, stairs and exits. It also embraces the questions of lighting and of ventilation, provision of stage ventilators, and special safety appliances, such as thermostats, automatic fire alarms, etc, telegraphic commnnication with the fire department, etc.

d. Measures to put out fires, which include all fire appliances, the stage sprinkler system, etc., a good, plentiful water service, etc.

The whole subject is discussed more systematically and at a greater length in my paper "The Essential Conditions of Safety in Theatres, an Essay on Modern Theatre Planning, Construction, Equipment and Management," published in the *American Architect* for June and July, 1894, to which I refer those in search of details. It will suffice here to enumerate only the principal measures of safety.

1. To begin with, the theatre building should be isolated as far as practicable. Then, there should be in every theatre plenty of wide, well arranged and well distributed exits, leading the audience as quickly as possible to outdoors, and thereby decentralizing the crowd. There should be separate and numerous fire-proof stairs, at least two for each tier. For the stage and its accessory departments provision should be made for at least two independent exits. Fire-proof stairs for the workmen should lead from the rigging loft down to the stage floor. The fire at the Opera Comique taught a good lesson in pointing out the necessity of having proper means of escape for the performers and workmen on the stage, which sometimes number as many as three or four hundred people. Where the theatre is not standing free on all sides, there should be wide courts on both sides and additional safety exits from the auditorium to the same, including suitable fire escapes from the balcony and upper galleries. Much the best plan, where the dimensions of the lot permit, is to have wide fireproof terraces, foyers or colonnades adjoining the corridors in each tier, which form places of safety for the audience in case they have to leave the theatre suddenly. All halls, corridors, passages, stairs, exit door, courts and exits should be free from all obstructions. All exit doors should open outwards. Exits should not be reduced at any point, but if possible, should widen outward. There should be plenty of wide aisles, without steps, and no chairs or camp stools should be permitted in the aisles. It is particularly important that there should be a sufficient number of stairs and plenty of exits for the occupants of the galleries, who, as the fire catastrophes described amply prove, are more endangered than the other spectators. Those who pay twenty-five cents admission fee have surely the same rights to safety as the occupants of three to five dollar seats, and in a place of amusement, to quote the words of the Rev. Dr. Duryea, spoken at the

funeral services for the victims of the Brooklyn Theatre fire, "the poor should be made as safe as the rich."

Stairs from different tiers should not communicate together, nor should streams of people cross each other on their way out. All stairs should be provided with handrails on both sides; winding stairs and single steps should be avoided.

The provision of proper exits (including in the broader sense of the word aisles, corridors, stairs, doors) is by far the most important safety measure, both for fire and for panic. In fact, if properly carried out, it will save the lives of people even where all the other precautions are neglected. The aim should be to arrange the exits so that a theatre can be emptied without the slightest difficulty in from two to three minutes. Much will depend upon the available site and upon the plan of the building.

If only plenty of exits are provided, so that, under all circumstances, the whole audience, even when frightened and suddenly thrown into a state of high mental excitement, can leave the building inside of two or three minutes, the fire-resisting qualities of the building are of less consequence, as regards the safety of the persons in the theatre. In fact, a theatre inferior in point of construction, but having exits as above described, would be safer than one built thoroughly fireproof, but otherwise not well arranged and not provided with sufficient stairs and exits, and where, therefore, in case of a false or real alarm of fire, or a panic from any cause, the people would be necessarily in grave peril.

2. Recognizing, from the lessons taught by past theatre fire catastrophes, that the stage is the chief point of danger, it should be the aim to completely isolate this part of a theatre. Fire walls should separate the stage from the auditorium on the one hand, and from the dressing rooms and theatre offices on the other The fire wall dividing the auditorium from the stage, in which is located the large proscenium opening, should have as few other openings as possible, and none at all above the level of the stage. All openings should be kept closed by fire doors. The proscenium opening should be fitted with a fire-resisting curtain, closing as nearly as possible hermetically. The chief object of the curtain is to localize a stage fire and to cut off the fire, smoke, and the view of the fire during the retreat of the audience: It thus serves to restore confidence, and will often help to avoid the usual panic and jam. The fire curtain should be able to withstand the increased air pressure due to the heat, sufficiently long to enable the audience to make its escape. Whether the curtain be of corrugated iron, or of asbestos, it is important that the apparatus for lowering the same be located on the stage, and not in the rigging loft, which place very soon becomes inaccessible when a stage fire breaks out.

3. Smoke and fire gases being the chief cause of death of the victims of theatre fire calamities, it is essential that large smoke ventilators or ventilating skylights be fitted up over the stage in order to remove the smoke at the highest point of the stage roof. Incidentally, the stage ventilators tend to create a current of air from the auditorium toward the stage, and thereby prevent smoke, flames, and suffocating gases from escaping into the auditorium. In this connection the abolishment of the usual central chandelier and ceiling vent in the auditorium is important. All ventilating registers for the auditorium should have dampers which are controlled and can be closed from the stage. This measure will tend to prevent the suffocation of the people in the upper gallery in case of a fire.

4. The study of the causes of theatre fires having shown that open gaslights in the vicinity of stage scenery and settings are the most prolific cause of fire, it is obvious that the stage and the scenery can be made much safer by fitting the same with incandescent electric light. All open lights, and gas lights in particular, as well as all sources of heat, should be eliminated from the stage. Incandescent electric light constitutes a brilliant, uniform, and easily regulated light. It has not only the advantage of being much safer as regards danger from fire, but it is superior also because it does not vitiate the air, because it creates much less heat than gas, and because it does away with the dangerous lighting up of gas flames, which has been the cause of many a fire. In short, the electric light in theatres has all the advantages of gas without any of its inconveniences and dangers. But, if gas lighting must be used, the gas piping should be most carefully done, all open flames should be well protected, the gas meters set in a safe place, and the best available electric spark or flash-lighting system should be installed for lighting up. In addition to the regular system of lighting, whether by gas or electricity, there should be provided in the corridors, stairs, and exits auxiliary lights, either candle lanterns or oil lamps burning vegetable oil to make the retreat of people safer in case the gas is turned off or in case the electric light fails. The central gas chandelier in the auditorium, moreover, should be abolished.

5. To increase the safety of the stage still further, it is imperative to insist upon the fireproof treatment of all stage woodwork by the application of fireproof paint, and likewise upon the chemical impregnation of all gauze scenery, draperies, furniture and costumes, to render same uninflammable. A further step forward in the right direction consists in the employment of light sheet iron frames or of wire cloth netting, or in the use of asbestos for scenic decorations. Improvements in the stage machinery, such as the use of hydraulic power for raising and lowering traps and scenery in place of wooden hoisting drums and hand labor, the substitution of steel wire ropes in place of hemp cord, the entire abolishment of borders and wings, are much to be desired, all of which tend to make the stage safer. These are not merely theoretical suggestions. They have, on the contrary, proved eminently practical in actual use. The improvements recommended are largely due to the Asphaleia Society, of Vienna, Austria, whose system of stage construction and stage machinery has been successfully used at the theatres of Buda-Pesth in Australia Hungary, at the People Theatre in Vienna, at the Halle Stadt Theatre in Germany, in the Victoria Theatre in Sydney, Australia, and in our country in the new Auditorium Theatre in Chicago.

The accumulation of much scenery or scenic decorations on or near the stage should be avoided, and not more scenery should be hung than is needed for two performances. Neither the auditorium loft nor the cellar under the auditorium should be used for the storage of scenery. Want of order on the stage is sometimes due to lack of storeroom or to an insufficient number of stage hands.

6. In the construction of the theatre building fire-resisting materials should be preferred, and unprotected ironwork granite and limestone should be avoided. The building should be divided into a large number of separate fire risks, both horizontally and vertically. The stage should be completely isolated by fire walls carried above the roof; all dressing rooms should be made fireproof and the whole auditorium and each of its tier, corridors and stairs should be constructed in a fire-resisting manner.

7. All scene docks, workshops, carpenter and paint shops should be banished from the theatre building and placed in a separate fireproof annex. The heating apparatus, the dynamos of the electric light plant, the fire pump and the gas meter should be located in fireproof vaults, preferably under the sidewalk, but not under the stage nor under the auditorium. No living or sleeping apartments, no stores, should be located in the theatre building, and no dangerous trades should be carried on in the same.

8. In order to put out a fire in a theatre before it can gain headway, there should be provided an abundant supply of water under fire pressure and plenty of efficient fire-extinguishing appliances, such as one or more fire pumps, fire stand pipes, fire valves, hydrants, monitor nozzles and fire hose; a large number of fire pails, casks of water, chemical fire extinguishers, fire axes, fire hooks on poles, wet sheets, wet sponges on long poles, etc. The whole stage should, moreover, be protected by an automatic sprinkler system, supplied from a large fire tank on the highest roof, and having also an outside fire department connection, to which the fire engines may be coupled. All the appliances mentioned are useful chiefly during the first moments of a fire, and wherever provided and kept in good order and in readiness for instant use, they have served to put out many a stage fire which, without them, might have resulted in a serious calamity. It is true, however, that as soon as the flames have spread, in the majority of theatres as constructed until recently, the fire appliances would soon become powerless to subdue a fire.*

9. Much care should be bestowed upon the heating apparatus for a theatre, for in not a few instances it has been the cause of a fire. A number of fires as sources of heat being out of the question on account of difficulties in attending to them, and also because they increase the fire danger, the choice lies between a warm air furnace, a steam and a hot water boiler. Furnaces can only be used for theatres of small size, and in the majority of cases heating is done by steam. The usual precautions should be observed, and the steam boiler placed in a fireproof vault, preferably outside of the theatre proper. It may with advantage be combined with the electric light plant.

10. Efficient lightning rod protection adds to the safety of a theatre building, and in European theatres its installation is generally included in the equipment of the building.

11. It is quite important to have on hand in every theatre, for cases of emergency, a few life-saving appliances, such as rope escapes, a jumping net and a cloth chute to aid in saving persons in case their retreat from the upper floors should be too suddenly cut off by fire or smoke.

12. Finally, it will be a great help in preventing theatre fires, if a fire watch is kept in the building day and night, reinforced during the hours of the performance by detachments from the city fire department. Nothing will increase more the security of a theatre than frequent inspections, about which I shall say something hereafter. There should be a telegraph connection with the nearest fire department station, and automatic fire alarms at many points in the building, which should be frequently tested to make sure that they are in good working order. There should also be speaking tubes, electric bells and telegraph alarms, to bring all parts of the building into communication with each other. And lastly, the theatre employes should undergo regular fire drills, so that in case of an emergency each employe will know what duty he has to perform.

13. Many of the safety appliances spoken of can be arranged so as to work automatically. Such automatic appliances are good in their way, and some of them have proved in actual experience to be quite efficient. They should not, however, be sorely relied upon, and in general it will be better not to trust to automatic appliances altogether. The automatic fire alarm system and the automatic sprinkler system may be approved, but the automatic sliding skylights, or the smoke ventilators over the stage roof and the automatic fire curtain may fail to work properly just when needed. I am quite aware of the fact that others argue in favor of antomatic appliances, claiming that one cannot rely in moments of danger upon the coolheadedness of men, and that in a panic every one will think of his own safety first, and theatres employes will forget their duties.

But in my judgment it is infinitely better to put all such appliances in charge of a special, reliable "safety officer," who may be a trusted firemen, whose sole duty, in case of an outbreak of fire, should be to lower the fire curtain, to open the stage ventilators, to close the auditorium ventilating registers, to send the alarm to the theatre engineer who runs the fire pump, and to the nearest fire engine station, to notify the audience promptly that they must disperse quietly, to see that the gas is not shut off and that the auxilary lights are kept burning, to see that all doors leading to the stage are kept closed to prevent a draught, and who should order the water turned on at the fire hydrants, the monitor nozzles and the perforated pipe system, where such is installed in place of automatic sprinklers.

I have not, so far, made any distinction between old and new theatre buildings, for the requirements for safety apply to both alike, but, of course, are much more difficult to enforce in the case of the older structures. These are everywhere, as a rule, lamentably deficient and unsafe, and much good would result if they were frequently inspected by the fire department, and if alterations were ordered made to increase the safety of audiences. The public generally is not able to, and does not, discriminate between safe and dangerous theatres. If the older theatres cannot be made safe, particularly as regards to exits, they should be closed up by the authorities. All theatre regulations should be compulsory, and the building, fire and police departments should have power to stringently enforce them. The law should clearly define the responsibility of architects and builders and of the theatre managers, in the matter of theatre safety. It is but reasonable to require of the atre managers that every known approved measure tending to increase the safety of the public, be provided for. It is likewise justifiable to require builders to construct places for public amusement in such a secure manner that all damages to life and limb are averted.

THEATRE INSPECTIONS.

In the case of new theatre buildings, it does not suffice to have them well planned and well constructed. There should be, after the opening, regular inspections to make sure that the laws are not violated after the new building has passed the final examination of the authorities. If subsequent alterations are contemplated, they should likewise be made to conform to the building laws. The theatre license should be subject to revocation at any time for violation of the law. In the efficient periodical inspection and control of theaters by the authorities lies the greatest safeguard against fire catastrophes. Such inspections should be made much oftener than once a year. In Vienna they occur four times a year, in Paris inspections are made every month by a committee of safety, consisting of a police commissioner, an official from the city fire department, and an architect. In London monthly inspections are required. These inspections should be made not only in daytime, but likewise in the evenings during a performance, and all details should be included in the examination. Special expert surveys and tests of the gas pipes, electric conduits, fire alarms and the fire appliances should be made from time to time, and official reports made as to the results found. It is best to make inspections without any previous announcement. The results should be published, without fear of favor, in the daily newspapers. Nowhere are theatre inspectors carried out with greater strictness than in Berlin. All theatres are regularly inspected and surveyed, at odd times, by a committee from the fire brigade and the building department. Every two weeks the district fire marshal examines the theatres, during the day and also at night. Finally, officers of the fire brigade make nightly inspections during the performances, and a

* Regarding the details of "The Water Service and Fire Protection of Theatres," I refer to my paper under this title read at the June, 1894, meeting of the New England Water Works Association.

watch of trained firemen is placed in every theatre during the performances. All these precautions have a tendency to awaken public confidence, and in case of a fire a panic is not so apt to occur. Indeed there are several instances of well-built and well managed theatres on record, where during a performance fire broke out which ultimately destroyed the building, but where the whole audience left the theatre quietly and in good order, and where no accident of any kind occurred.

For the safety of theatres it is essential that they be continuously watched. In the words of Mr. Garnier, the architect of the Paris Opera House, "The strict minute and incessant watch and inspection of all parts of a theatre constitute the chief defense of theatres against fires."

A century ago it was decided in France that firemen were the proper persons to do this. At first they were present on the stage merely during performances, subsequently it was decreed that firemen should be on watch in a theatre during the day and the night. If the employment of fire watches is left to the discretion of theatre managers, persons are sometimes engaged who are incompetent, or if competent, they are required to perform other duties besides, and being thus overworked, fail to efficiently accomplish the object sought for. Fire watchmen should be well acquainted with the building, the whole theatre staff should be under their control and they should be vested with authority to interfere in case of violation of the theatre regulations. In the large Paris Opera House there are always twenty-five firemen on duty and during performances their number is doubled.

* * *

THEATRE MANAGEMENT.

Strict rules and regulations pertaining to the management of theatres should be drawn up by the authorities, and enforced by the fire, building and police departments; which, as regards theatres, are correlated. Such rules of management relate to the proper storage of decorations, scenery, furniture and property, to the maintenance of general order, cleanliness and discipline; to the removal of rubbish, litter and ashes, to keeping the scenic decorations free from dust, keeping all corridors and exits unobstructed, and likewise to holding all fire stand pipes, hydrants, fire pails and casks of water accessible and ready for use.

They also relate to the use of open fires and lights, the employment of special lights and fire effects, the use of fireworks, of firearms, the representation of actual fire scenes, the use of matches, the prohibition of smoking or lighting cigars in the auditorium, foyers or dressing rooms, and should only permit the same where needed in the course of the play. These rules should also include the daily use of the fire curtain, and the opening of all exits, the maintenance of auxiliary lights, either oil lamps or candle lanterns, in corridors, courts, and exits, the keeping up of steam under proper pressure at the fire pump during performances, the employment of a special fire watch and a theatre night watch, etc. They should require the fireproof treatment of all gauze costumes, and prohibit the use of open lights in the wardrobes and dressing rooms. A penalty should be enforced for the use of fire pails for other than fire purposes. Moreover, the number of persons in each tier should be limited by law, and standing room in the aisles should be prohibited, and a heavy fine enforced for any violation of these rules. The practice of a sudden, unannounced darkening of the auditorium should not be permitted, nor any dangerous fire exhibitions on the stage, except where the stage is absolutely fireproof. Special precautions should be enforced where the stage is decorated with natural branches of fir trees which when exposed to heat dry out quickly and become extremely fire-hazardous, and also where the auditorium and the stage are temporarily thrown together, as during masquerade balls. The rules should prohibit workshops of any kind in the theatre proper. They should finally require clear plans of the theatre, showing the exits, to be hung up at conspicuous points and also to be legibly printed on all theatre programmes, and last, they should compel the plain marking of all exits in large letters painted over the doors.

One cannot learn the dangers incident to large fires, nor the effect of good fire-extinguishing appliances, better than by being daily engaged in fighting flames, nor can anybody have a better appreciation of the effect of suffocating smoke than a fireman. Firemen, therefore, are as well qualified as builders, architects and engineers, to judge of the security of a theatre building, and of the efficiency of the safety measures adopted. The training of firemen is such as to make them proper persons to examine and pass upon the plans for new theatres, and to inspect both the theatres in course of erection as well as those already built. With their assistance the rules and regulations for theatre management should be framed, they should be entrusted with the inspection of theatres, to see that the rules are enforced; finally, they should be in charge of the fire appliances in theatres, and should direct the fire drill of the employes.

Only a few more words in conclusion. Experience teaches that after each theatre fire, accompanied by loss of life, the greatest excitement prevails for a time; the daily papers, the magazines and the technical press are full of articles discussing defects of theatres snd suggesting remedies; the public refrains temporarily from going to these places of amusement; the authorities show the greatest zeal in making official inspections; and theatre managers actively undertake interior improvements. Very soon, however, the excitement subsides after a little while the lessons of the calamity are forgotten, the theatre management resumes old habits, the most common precautions are neglected, the public becomes again indifferent to the dangers constantly threatening them in unsafe theatres and everythings goes along as before. This, I need hardly say, is all wrong.

There is an old adage which says, "In time of peace prepare for war." Applied to our subject, it means that the movement for theatre reforms should constantly be kept stirred up, that without unnecessarily alarming the public, interest in the subject of theatre fire prevention should be ever maintained, and that quiet but persistently radical measures should be adopted to stamp out the graver dangers to which human life is exposed in the theatres of many of our cities.

Strict theatre building laws and frequent theatre inspections by the fire departments constitute the most important factors in lessening, for the future, the number of theatre fire catastrophes—*Scientific American.*

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 108 California street
SETH BABSON, Pres. GEO W. PERCY, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

THE REGULAR MONTHLY MEETING OF THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE regular monthly meeting of the San Francisco Chapter of the American Institute of Architects, was held on Friday afternoon, December 12th.

The Committee appointed at last meeting, at the request of the San Francisco Chamber of Commerce, to consider the question of the prompt construction of the Nicaragua Canal, made their report and were discharged.

A Committee of Messrs. Sanders, Bestor and Henriksen was appointed to act with the Executive Committee in formulating a law to be submitted to the Legislature for Regulating the Practice of Architecture in this State.

The following communication was received from Secretary Stone of the Institute:

PROVIDENCE, R. I., Dec. 4, 1894.

Mr. Oliver Everett, Secretary, San Francisco Chapter A. I. A.

DEAR SIR:—In response to questions from the Secretaries of several chapters of the Institute and also from the Fellows of the same, the Secretary of the American Institute of Architects, after having submitted the same to the Chairman of the Committee on the relations of the chapters to the Institute, begs leave to submit the following as his interpretation of the effect of the amendments of the By-laws as passed at the last annual convention.

1.—The amendments went into effect on the adjournment of the convention.

2.—No person's election to the special grade of practising membership in a chapter, required by Section 3 of Article 10, can be complete until such person has been elected a Fellow of the Institute.

2.—The initiation fee of the chapter grade referred to above is $10.00, and the annual dues $5.00.

4.—In order to become a chapter member of such grade, it is necessary to have practised the profession of architecture for not less than three years.

5.—A chapter may provide for other classes of members than the above, with higher or lower dues, with distinguishing titles; such members need not become Fellows of the Institute, but they may do so whenever eligible through a practice of three years.

6.—A Fellow of the Institute not a member of a chapter when the new by-laws were passed, need not join a chapter unless his Fellowship should lapse and he should again apply for Fellowship.

7.—A member of a chapter not a Fellow in the Institute when the new by-laws were passed, need not join the Institute.

8.—All architects now wishing to join the Institute must have been in practice for at least three years, and must at least be provisionally elected to the above mentioned grade of practising membership in a chapter in the Institute, unless their place of business is more than twenty-five miles from the headquarters of any chapter.

9.—Resignation from any chapter carries with it resignation from the Institute, and vice versa.

Yours truly,

ALFRED STONE,
SECRETARY.

The meeting then adjourned for one week, to give the Committee on Legislation time to report.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

VALIDITY OF INDEMNIFYING BOND BY CONTRACTOR.—A bond by a contractor, indemnifying an owner against liens on his building, is valid, though the plans and specifications forming part of the building contract were not filed with the county recorder. Where the surety on a bond given by a contractor to an owner, to indemnify the latter against mechanic's liens on his building, supplies to the contractor material for such building, and files a mechanic's lien therefor, and in consideration of the satisfaction of the lien the owner gives him his note for an amount less than the claim, the owner may, in an action on the note, set up as a defense the liability of the surety on his bond.

Blyth v. Robinson, Supreme Court of California, 37 Pac. Rep. 904.

ASSIGNMENT OF MECHANIC'S LIENS.—An assignee of a mechanic's or material man's claim cannot file the notice of a claim or serve the notice on the owners, so as to perfect the lien, as the privilege of asserting a mechanic's lien cannot be assigned.

McCrea v. Johnson, Supreme Court of California, 37 Pac Rep. 902.

IN AN ACTION FOR PERSONAL INJURIES.—Evidence tending to show that the employe while working, was directed by his foreman to go on a temporary scaffold to help carry a heavy beam over it; that the scaffold consisted of planks laid across two joists which were set on edge without being fastened, and one of which having a large knot near one end turned and broke, injuring him; that the foreman had superintended the construction of the scaffold; and that he was not aware of the knot in the joist, is sufficient to warrant the submission of the case to the jury. The amount of damages in personal injury cases is a question of fact not reviewable by the supreme court.

Goldie v. Werner, Supreme Court of Illinois, 28 N. E. Rep. 95.

WHEN LIENS MAY BE CREATED ON HOMESTEAD.—Under the statute, which provides that "every building constructed on any land with the knowledge of the owner shall be held constructed at his instance and subject to liens unless such owner within three days posts a notice disclaiming responsibility," liens may be created on a homestead without the joint action of husband and wife.

Palmer v. Lavigne, Supreme Court of California, 37 Pac. Rep. 775.

THE SUPREME COURT OF MICHIGAN—Holds that where one who has contracted to do work stops it by reason of the command of the one with whom he has contracted, he is entitled to damage for breach of the contract; but he cannot claim a breach of the contract where he merely acquiesces in a request to do no more for a certain time.

McGregor v. Ross Estate, 60 N. W. Rep. 38.

EFFECT OF PURCHASE OF PROPERTY IN WIFE'S NAME.—Creditors have no right to their debtor's services; and where he buys a mill for his wife in her name and on her credit, and by his management makes profits which he applies on his wife's notes, the property is not liable for his debts. If a husband uses his own money to pay his wife's debts on her property, his creditors might charge her property with the amount paid, but could not, therefore, treat the property as his, and subject it to his debts.

Wheeler v. Biggs, Supreme Court of Mississippi, 15 So. Rep. 118.

VALIDITY OF CONTRACT LIMITING LIABILITY.—A contract between a shipper and a common carrier, which, by its terms, limits the liability of the carrier, and relieves it from either entirely or partially responding in damages for injury or negligence of the carrier, is invalid, or void, under the common law, as against public policy.

Atchison T. & S. F. Ry. Co. v. Lawler, Supreme Court of Nebraska 58 N. W. Rep. 968.

CONSULT THE ARCHITECT.

THE desire to practice economy in connection with the erection of a proposed building improvement sometimes prompts the individual who is about to build to deny himself the services of the architect. Some ambitious builder tell him that he can prepare the plans just as well and thereby save the fee that would otherwise go to the architect. The novice in building matters believes the builder and begins to take his lesson in experience. The builder has secured his victim and proceeds to bind him, hands, feet and pocket-book. The victim gets a cheap building, oftentimes faulty in construction, and pays a fat price for the same, happy in thought, for the time being that he was able, by shrewd, (?) business tact to save the expense that would have been incurred had he consulted an architect.

In connection with a contemplated building improvement of any magnitude the services of a competent architect are indispensable. Nobody thinks of consulting the drug clerk in case of serious illness—you go for the doctor. The drug clerk is of service too, for he can execute the doctor's orders in filling prescriptions, but nobody wants the clerk's advice at such times. So in building you want the advice of the architect. He can give the orders and the builder, if he is competent, can execute them. The architect is a good man to have around the progress of construction for his experienced eye can detect flaws in material and construction that would not be noticed by the owner. Finally, whence the building is completed, under the supervision of the architect, it is ascertained that a good job has been obtained for a comparatively small amount of cost. If you are going to build a dwelling or a building for business purposes you will save time, worry and time and money by first consulting some reputable architect, and you will be wise if you leave the matter entirely in his hands. He knows the difference between good and bad material, between good and bad construction, and he knows when the builder is doing his duty. Presumably you don't know much about these things and you had better pay some one to look after them for you.—*The Builders' Gazette.*

"Ah, Miss Oldgirl," said Charlie Smart, pointing to a bunch of roses on her breast, "I see you wear bloomers." They do not speak now.—*Minneapolis Journal.*

CEMENT FLOORS.

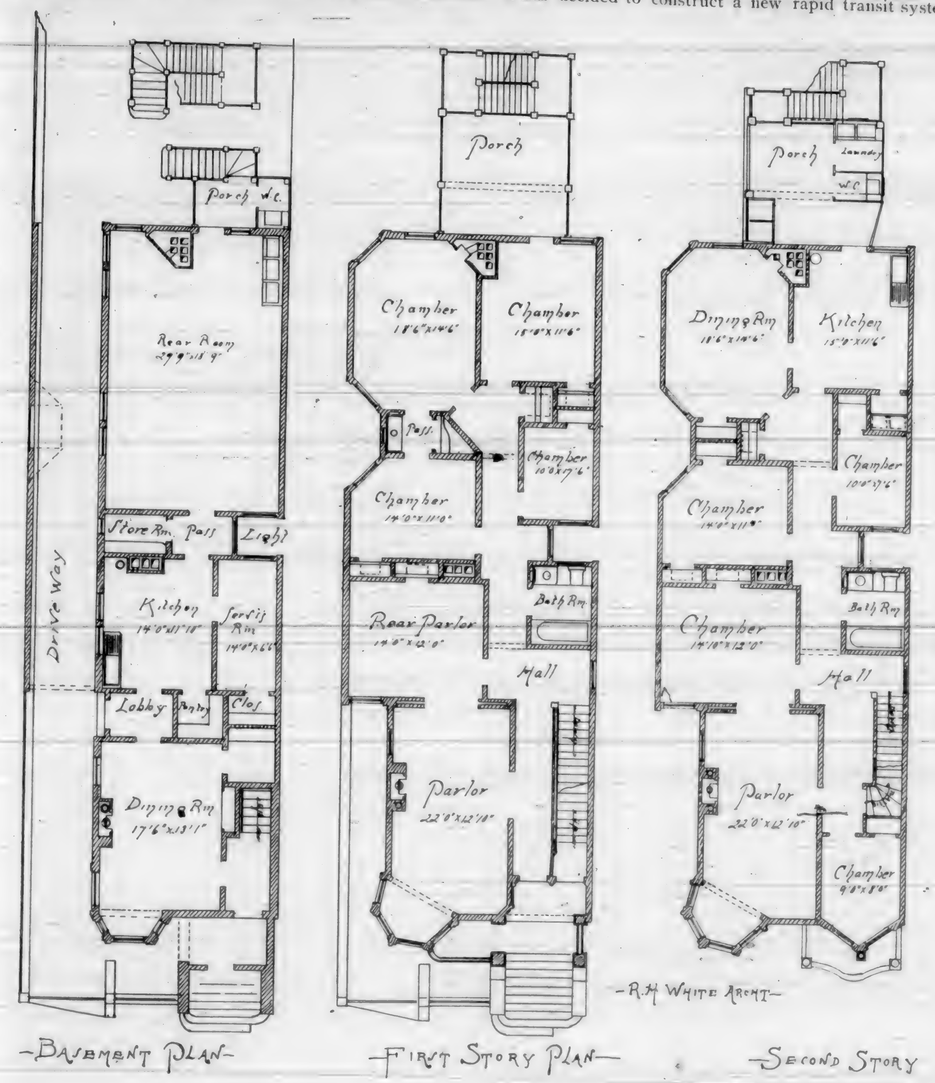
IN several parts of the world, widely distant from each other, the workmen, are in the habit of making cement and mortar floors of a remarkable degree of smoothness and solidity. The general principle involved in all the operations is compression by means of light hammers or mallets, and constant rubbing of the surface, so that the mortar becomes exceedingly hard and solid. In India the floor is made by putting bricks on edge in mortar in the usual way for a foundation. Upon this is spread a layer, say, four inches thick, composed of pounded bricks and freshly-slaked lime, says the *Carpenter and Builder.* The pieces of brick are about the size of a pea. A mortar is then made of one part by measure of lime and two parts of the siftings of these same bricks, which also contain a small proportion of the large size. This mixture is thoroughly mixed with water, and spread over the substratum to a depth of perhaps four inches. After this the whole surface is thoroughly beaten with light wooden mallets. The beating is kept up for several days, and the layer thoroughly consolidated. This reduces its thickness to about three inches. It is allowed to set for some time before putting on the cement. The appearance of the floor at this stage is somewhat rough, and this is considered an advantage, as it enables the cement to adhere more firmly. The cement is mixed with a coarse, sharp sand, one part of cement, two parts of sand, and a sparing amount of water. It is put on 3/8in thick and leveled. A little dry cement is powdered over the surface and rubbed in with a trowel. The final skin is secured by rubbing the floor with a slightly moistened trowel. This makes a hard and highly polished surface.

A GOOD EXAMPLE.

DURING the month of June the carpenters of St. Joseph Mo., are reported as having struck for certain concessions from the employers which would involve an increase in the cost of building. The principal demand of the workmen was for an increase in wages, but an unusual course was taken in the effort to secure the concession. The carpenters refuse to work only on such jobs as the contractors had been afforded an opportunity to estimate upon at the increased rate of wages. It is reported that no movement was made against jobs that had been taken by the contractors at the lower rate of wages; the whole action of the carpenters seeming to be a refusal to work upon new jobs at the old wages. The course pursued by the men in this case showed a just appreciation of business principles, and enabled such contractors as were willing to do so to increase the wages without loss to themselves. It is stated that the employers were so favorably impressed with the stand taken by the men and the spirit of fairness in which they acted that all but two conceded the increase at once; and the two who are reported as having held out, finally fell in line. It is rarely the case that a manifest effort to be fair fails to elicit a proper response, and every such effort by either workmen or employers should be met half way by the other. —*Carpenter and Building.*

MUNICIPAL OWNERSHIP OF A RAPID TRANSIT SYSTEM.

NEW York is about to enter upon the most important experiment in municipal self help ever undertaken in America. By a vote of three to one and a majority of 70,000 it has decided to construct a new rapid transit system for itself. The contracts will be let by a city Rapid Transit Commission and the bills paid from the proceeds of municipal bonds. This decision has been reached after a failure to accomplish the same result through private enterprise. The elevated railroad monopoly has succeeded in preventing private competition in urban transit in New York, just as the Southern Pacific has prevented all kinds of railroad competition in California.



The new rapid transit system will run underground and will probably cost at least $40,000,000. It is expected to be a model in every way. The motive power will probably be electricity, but the results required from it, of course, will be beyond any comparison with those on ordinary trolley lines and will be of the same order as those obtained from the best steam locomotives. A conspicuous success of this great experiment in New York, following the successful operation of the public cable line over the East river bridge, would stimulate the movement for the municipal ownership of local transportation facilities everywhere.—*Examiner.*

BOOKS AND PERIODICALS.

THE NEW SCIENCE REVIEW. Published quarterly by the Translantic Publishing Company, Philadelphia, New York and London. This handsome quarterly magazine appears destined to fill a want long felt, by that class of people the late President Lincoln would call the "common people," or as the Rev. Edward E. Hale would express it "the children of the public." To this class all the articles prove profitable and interesting.

The contents for the October number now before us contains a long list of interesting articles, and among the others "What Electricity Is" will not fail to be of interest to many who think they know all about it now, but who will be willing to be more modest in their claim after reading it.

If Mr. J. M. Stoddart the editor continues to sustain the high standard he has commenced we predict a success for the new venture.

FISH COMMISSIONER'S REPORT.—The Thirteenth Biennial Report of the State Boart of Fish Commissioners of the State of California for the years 1893–1894, printed for the State at their office in Sacramento. The commissioners are Joseph D. Redding, President; Hugh L. Macneil, Los Angeles; William C. Murdock, Secretary, San Francisco.

This report certainly makes a very favorable showing of the result of the labors of this commission. It cannot fail to be of interest to that large class who are favorable to the introduction and protection of fresh water fish. The illustrations of the fish are faithful reproductions, while the State Fish Hatchery, at Sisson, California, give a good idea of the buildings surrounded by redwood trees where the fish are carefully nursed till large enough for removal.

OUVENIR OF CRANFORD, NEW JERSEY.—Illustrated by some thirty sketches of principle buildings, including churches, residences, etc., "A Quiet Nook" and "Down the River" are worthy of an art journal.

The population of the town is about twenty-five hundred and in the last three years some $750,000 have been spent for building purposes mostly by new comers from New York and Brooklyn. Now, that speaks well for the enterprise of the real estate men, and if our real estate dealers would manifest a little of the same snap and business tact, instead of waiting for business to come to them, our city would show a marked improvement in building and business in general—why we doubt if there is a real estate dealer in the city with pluck enough to subscribe to an architectural journal, let alone the idea of getting out an Illustrated Souvenir. If they had any pluck, the San Joaquin Rail Road would be well under way by this time.

GOVERNMENT RAILROADS—The question of government ownership or government control of railroads is one that has been brought prominently before the people of late years, and at the present time is of particular interest to the Pacific States.

Arthus Pew, of Macon, Ga., has lately published a pamphlet of notes on Government Railroads, containing many valuable statistics of results obtained by other countries where the railroads were owned by the government.

LONG DISTANCE HOUSE MOVING.

A curious case of house moving was recently witnessed in Oregon: A man who owned a residence at Seattle, which cost him $5000 to erect, removed to Olympia and did not have sufficient funds to build another house. He bought a lot and concluded to remove the building he owned at Seattle. Every one laughed at him, but he persisted. Rolling the house down to the river, he loaded it upon a scow and it was soon at Olympia, a distance of about 60 miles. Then he had it rolled upon his lot and, strange to say, not a timber was strained nor even a piece of furniture broken, although he had not removed the contents before starting the house upon its unusual journey.—*Scientific American.*

CORRESPONDENCE SCHOOLS.

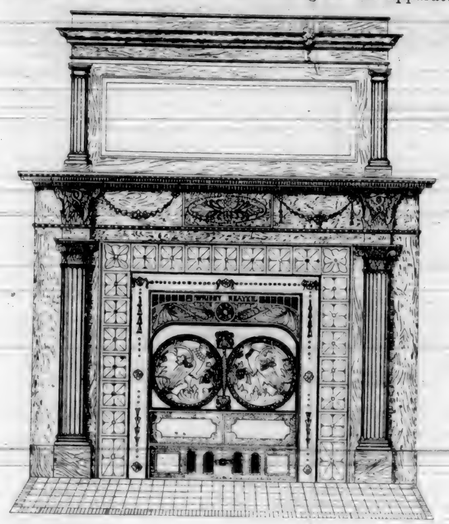
We mentioned last month the receipt of a number of publications relating to the "Correspondence Schools," at Scranton, Pa., among these, and of most interest, are a large number of letters, nearly two hundred, written by students in respect to their experience and opinions of the system. It is the most original agency for technical education that has ever been devised, capable of an extension that has no visible limit, and portends a time when we will not set off a few of the most fortunate for education, but educate all up to the limits required in the application of the skilled arts. One effect will be to raise the standard of the ordinary courses in technical colleges and schools, because mediocrity can be attained at a tithe of the expense and in ways more congenial to most students.

The habit of writing out exercises is a good one, good in all kinds of mnemonic effort, and when to this is added the interest of a communication personally addressed, and the environment of a home, it is easy to discern the attraction of a correspondence system.

Among the papers mentioned is one sheet of examples in hydraulics that as a collection of educational problems is the best we have seen. When a set school book is done, and the plates made, there is an end, but in the present a tentative course is possible. Change and improvement can go on continually; not only this, the problems submitted can be nicely graded to the requirement and capacity of the student, and can, by the facility for change, be made relevant to particular examples or practice.—*Industry.*

BUSINESS MOSAICS.

Among the latest heating novelities is a recent patent Mantel Hot Water Heater patented by Mr. Wright of the firm of Wright & Olsen as shown by the accompanying engraving. Among the many points claimed for it is the economy in the first cost in putting in and the small expense to operate as with the fire used in one fire place with this apparatus it will heat four or five other rooms. It has been a great drawback to owners building flats in this country not having an easy mode to heat them, for when they place a heater in the basement it was a stumbling block to arrange for some one to attend to the running of the apparatus.



Then again the question of fuel was brought up as some of the tenants would want heat and others would not and trouble would arise as to the adjustment as to who had used the most heat. This new device obviates all the objections as to fire places not heating the room in which they were placed, but with this apparatus it not only heats the room in which it is placed but four or five others and with the same amount of fuel that would be used in trying to heat one room as with the present system of fire places. They have one in operation in their store which demonstrates that they can heat a large store with this new fire place heater while it is known that the ordinary fire place heater will not heat a small living room. This is worthy the attention of all architects and builders.

Friend—"I wonder, Ethel, that you allowed that Frenchman to kiss you in the conservatory?" Ethel.—"I couldn't help it!" Friend—"Why couldn't you help it?" Ethel—"Because I can't speak French."—*Pearson's Weekly.*

The heavy rains we have had for the last week will convince those that did not have their houses lined with P. & B. Building Paper, that they made a mistake. It should be a warning to those about to build not to neglect to have this important matter attended to in time.

The J. L. Mott Iron Works, New York, Boston, Chicago, St. Louis and San Francisco. We wish to call the attention of our readers to the advertisement on page v of the above named firm who appear to be constantly on the watch to produce something in their line that is an inprovement of what went before. Mr. M. S. James the Pacific Coast Representative can be found at his office, 35 Flood building, always willing to furnish information and circulars.

Doctor—"For Heaven's sake Mike, what are you doing in that bath! Do you want to kill yourself?" Mike Mevers—"Why doctor didn't yez tell me to take three pills in wather?"—*Clay Record.*

At the Montreal meet of the American Society of Mechanical Engineers, an interesting paper was read on methods for preserving metal used in pipes, roofs, bridges, poles, construction work, etc. In conclusion, the whole question of how best to protect iron and steel from corrosion in all the varying conditions that the wants and usages of to-day demand, seems to resolve itself into several "Don'ts," as the best method of answering it, to wit:

Don't have any scale on the metal. Don't paint it with anything but pure linseed oil and oxide of lead or graphite paints. Don't forget that frequent inspection and care are very necessary. Don't let the cost and interest accounts be the governing factors in the case of protecting any meta structure on whose continuity and strength human life and safety depend. In comparing the two paints recommended, it may be well to add that a properly made graphite paint should prove more durable and a better protector than oxide of lead. Graphite has a strong affinity for metal surfaces, and experienced painters claim that even where light colors are desirable, graphite paint should be used as a priming coat. Again, graphite is impervious to the action of heat, cold, sea air, acid or alkali fumes, which are more or less destructive agents to lead paints. The Joseph Dixon Crucible Co., Jersey City, N. J., have manufactured a pure linseed oil and graphite paint for over twenty-five years, and have some very convincing testimonials of its value.

He came and stood beside the typewriter. "I am greatly interested in you," he said tenderly, "will you be my wife?" The girl wrote four words before replying. "No," she remarked finally, "I prefer to have you interested in me."—*Detroit Tribune.*

Phoenix Pure Paint is a good example of how an honestly prepared article can be relied upon to work its way into public favor. Starting with the idea that to insure the best results, pure materials only should be used, and these finely ground and thoroughly mixed by heavy machinery, the result has been that Phoenix Pure Paint is now generally specified by architects on the Pacific Coast.

"You little imp!" replied the father, "if I catch you risking injury in a football game I'll break every bone in your body!"—*Adams Freeman.*

San Francisco Lumber Company. This well-known company, wholesale and retail dealers in lumber, continue to have their principle office corner Pine and Montgomery Sts., while their yards may be found at the foot of Third and Channel streets, between Fourth and Fifth. The manager, Mr. J. N. Curtis is a man that is sure to give satisfaction to those who have dealings with the company, as also their secretary, Mr. Gregg.

TENDERS TO BE RECEIVED.

Office of the Custodian, U. S. New Appraisers Stores, San Francisco, California, December 3, 1894. Sealed proposals will be received at this office until 12 o'clock M. on the 8th day of January, 1895, and opened immediately thereafter, for all the labor and materials required for the ainting, etc., of this building, in accordance with the specification, copies of which may be had at this office.

Each bid must be accompanied by a certified check for a sum not less than two per cent of the amount of the proposal. The right is reserved to reject any or all bids, and to waive any defect or informality in any bid if it be deemed in the interest of the Government to do so. All bids received after the time stated will be returned to the bidders. Proposals must be enclosed in envelopes, sealed and marked, "Proposals for Painting, etc., at the U. S. New Appraisers Stores, San Francisco, California," and addressed to JOHN H. WISE, Custodian.

Treasury Department, Office, Supervising Architect, Washington, D. C., December 4th, 1894. Sealed proposals will be received at this office until 2 o'clock P. M. on the 8th day of January, 1895, and opened immediately thereafter, for all the labor and materials required for the approaches to the U. S. Custom House, Post Office, etc., at Port Townsend, Washington, in accordance with drawing and specification, copies of which may be had at this office or the office of the Cnstodian at Port Townsend, Washington.

Each bid must be accompanied by a certified check for a sum not less than 2 per cent of the amount of the proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid, should it be deemed in the interest of the Government to do so.

All bids received after the time stated for opening will be returned to the bidders. Proposals must be enclosed in envelopes, sealed and marked, "Proposal for Approaches to the U. S. Custom House, Post Office, etc., building at Port Townsend, Washington," and addressed to,

CHARLES B. KEMPER,
Acting Supervising Architect.

CITY BUILDING NEWS.

Austin near Larkin. To build; owner, Olympic Salt Water Co.; architect, H. A. Schulze; contractor, J. H. McKay; signed, Nov. 12; filed, Nov. 22; cost $12,870.

Austin near Larkin. Concrete and cement work; owner, Olympic Salt Water Co.; architect, H. A. Schulze; contractor, S. B. Cushing; signed, Nov. 12; filed, Nov. 22; cost $3060.45.

Battery between California and Sacramento. Additions and repairs; owners, Main & Winchester; architect, C. Geddes; contractor, James McLean; signed, Nov. 9; filed, Nov. 15; cost $1440.

Bryant near Second. To build; owner, Margaret Brown; contractor, M. C. Lynch; signed, Nov. 24; filed, Nov. 24; cost $5500.

Bush and Baker. To build; owner, J. McInerny; contractor, J. McInerny; cost $5000.

California near Baker. Two two-story frames; owner, Mrs. C. F. Clarke; architect, W. H. Wharff; contractor, F. W. Maurice; signed, Nov. 14; filed, Nov. 15; cost $6721.

Cumberland street No. 120. Additions and alterations; owner, William Wallace; contractor, G. G. Gillespie; signed, Nov. 19; filed, Nov. 20; cost $1315.

Clay near Broderick. To build; owner, Otto Tum Suden; architects, Salfield & Kohlberg; contractor, H. Rohling; signed, Nov. 23; filed, Nov. 23; cost $4418.

Clay and Polk. Alterations; owner, Warring Wilkinson; architects, Wright & Sanders; contractor, J. Stuart Mackay; signed, Nov. 26; filed, Dec. 3; cost $4395.

Day near Sanchez. Alterations and additions; owner, Anton Schwellinger; contractor, H. Klahn; signed, Nov. 24; filed, Nov. 30; cost $1620.

De Long Ave. near Fredrick. Cottage; owner, W. D. Scurlock; architect, Clide Currigan; contractor, A. Larsen; signed, Nov. 12; filed, Nov. 14; cost $1720.

Diamond near 25th. To build; owner, Eliza Harrington; contractor, J. T. Hofmeister; signed, Nov. 20; filed, Nov. 21; cost $1600.

Douglass near 22d. To build; owner, Chas. T. Collins; architect, T. J. Welsh; contractor, H. Jacks; signed, Nov. 28; filed, Dec. 6: cost $1185.

Folsom near 18th. Painting; owner, Charles Back; architects, Kenitzar & Barth; contractor, W. E. Mortensen; signed, Oct. 11; filed, Nov. 27; cost $1020.

Fulton near Steiner. Six flats and addition to one-story cottage; owner, T. R. Scheyer; architect, Salfield & Kohlberg; contractor, T. R. Bassett; signed, Nov. 17; filed, Nov. 22; cost $12,523.

Golden Gate Ave. near Laguna. Three-story addition; owner, G. H. Luchsinger and others; architect, H. Geilfuss; contractor, F. W. Kern; signed, Dec. 1; filed, Dec. 4; cost $3820.

Hayes near Octavia. To build; owner, G. Boro; architect, J. Godart; contractor, F. W. Kern; signed, Nov. 15; filed, Nov. 17; cost $7072.

Hayes near Lott. To build; owner, Peter Martin; architect, T. J. Welsh; contractor, W. Koenig; signed, Nov. 14; filed, Nov. 16; cost $1610.

Laguna and Jackson. Stone work; owner, W. F. Whittier; architect, E. R. Swain; contractor, O. E. Brady; signed, Oct. 12; filed, Nov. 9; cost $8670.

Laguna and Jackson. Spanish tiles, etc.; owner, W. F. Whittier: architect, E. R. Swain; contractor, Forderer Cornice Works; signed, Nov. 21; filed, Nov. 24; cost $4200.

Langton and Bryant. To build; owner, Mary A. Baxter; contractors, R. Doyle & Son; signed, Nov. 16; filed, Nov. 17; cost $2100.

Market and Pine. Alterations and additions; owner, Eliza N. Sherwood; architect, Clinton Day; contractor, John T. Grant; signed, Nov 30; filed, Dec. 1; cost $720.

Market between 6th and 7th. Two-story brick; owner, V. E. Harrigan; contractor, R. M. Murray; signed, Nov. 24; filed, Dec. 3; cost $5993.

McAllister near Parker Ave. To build; owner, Jacque Faivre; contractor, W. W. Rednall; signed, Nov. 20; filed, Nov. 21: cost $1815.

McAllister near Park Ave. To build; owner, Samartha A. Wohlke; contractor, W. W. Rednall; signed, Nov. 20; filed, Nov. 21; cost $1815.

Minna near 7th. Three-story building, six flats; owner, Eugen Paulme; architect, C. M. Rousseau; contractor, R. Van de Pavert; signed, Nov. 12; filed, Nov. 13; cost $6625.

Ninth Ave. near C. street. Two frame cottages; owner, Mary M. B. Martin; contractor, J. Winberg; signed, Nov. 8; filed, Nov. 13; cost $3840.

Pacific Ave. and Octavia. To build; owner, E. J. York; architect, H. Burns; contractor, T. McLachlan; signed, Nov. 17; filed, Nov. 17; cost $9450.

Pacific Ave. and Octavia. Plumbing work; owner, E. J. York; architect, H. Burns; contractor, W. F. Wilson; signed, Nov. 17; filed, Nov. 17; cost $1975.

Powell bet. Ellis and O'Farrell. Alterations; owner, Thomas Regan; contractor, W. Paulson; cost $1000.

Post near Leavenworth. Alterations and additions; owner, Geo. B. Jones; architect, R. H. White; contractor, J. L. W. Saunders. cost $1695.

Pine near Franklin. Alterations and additions; owners, T. Kelly & Sons; architect, M. J. Lyon; contractor, James Campbell; signed, Nov. 10; filed, Nov. 13; cost $4750.

Pine near Franklin. Brickwork; owner, T. Kelley & Sons; architect, M. J. Lyons; contractor, D. J. O'Brien; signed, Nov. 10; filed, Nov. 13; cost $1057.

Scott Place near Broadway. To build; owner, Jean Clavere, individually and as trustee for estate of Pierre Clavere; architect, Oliver Everett; contractor, J. B. Pene; signed, Nov. 13; filed, Nov. 13; cost $2550.

Scott near Clay. To build; owner, D. F. McCrath; architect, C. F. Robertson; day's work; cost $7000.

Second Ave. near Clement. To build; owner, Nathan Abraham; contractor, White Bros.; signed, Nov. 27; filed, Dec. 3; cost $2350.

Vallejo near Laguna. Plumbing; owner, C. E. Lipp; architect, Oliver Everett; contractor, Geo. Humphrey; signed, Nov. 16; filed, Nov. 17; cost $1295.

Vallejo near Franklin. Alterations and additions; owner, Henry Evans; architect, H. D. Mitchell; day's werk; cost $3000.

Vallejo near Franklin. Alterations and additions; owner, Henry J. Evans; architect, H. D. Mitchell; contractor, L. B. Schmid; signed, Nov. 27; filed, Nov. 27; cost $2200.

Valencia and Quinn. Alterations and additions; owner, Sarah B. Melone architect, Clinton Day; contractors, Cannon & Thompson; signed, Nov. 26 filed, Dec. 4; cost $2330.

Van Ness Ave. near Geary. Alterations and additions; owner, T. J. Simons; architects, Salfield & Kohlberg; contractor, A. Jackson; signed, Nov. 20; filed, Nov. 23; cost $4200.

Waller near Masonic Ave. To build; owner, Gussie Palmer; architect, W. H. Lillie; contractor, James McLean; signed, Dec. 1; filed, Dec. 8; cost $2110.

Webster near Elm Ave. To build; owner, L. D. West; contractors, Hyde & Cox; signed, Nov. 12; filed, Nov. 23; cost $5300.

Webster and Ivy Ave. Additions; owner, Teresa Murphy; architect, M. J. Welsh; contractor, Chas. Donglass; signed, Nov. 29; filed, Dec. 3; cost $2000.

OF the many bills introduced in the present legislature, the one to regulate the practice of Architecture in the State of California, formulated by the San Francisco Chapter and the Southern California Chapter of the American Institute of Architects, is of special interest to the profession. It is a step in line with the attempts that have been made of late years in Eastern States to legislate on the subject. There is no valid reason why the public should not be protected from unscrupulous practitioners in the noble art of architecture, in the same manner as in the case of lawyers and doctors.

The questions concerning life, health and property that have to be decided by the Architect, are quite as numerous and important as similar questions handled by the other professions just mentioned, and the men interested in educating the public to a just appreciation of the desirability of the proposed law, are hopeful of success. While we cannot have the credit of being the first State to make this step of progress, yet we hope California will not lag too far behind her sister States in a matter of such public interest. The proposed bill has received the careful consideration of the Chapters of the Institute in this State, and while not precisely the same as the laws favored by the legislatures of New York and Texas agrees with them in their general features.

While the proposed bill may not cover all the points that it may be found advisable to regulate, yet its passage will be of benefit to the public, and the law can be amended and perfected, should its practical workings reveal any defects not now forseen.

The full text of the proposed bill will be found in another column.

IN this number we publish a copy of the Bill now before Congress for providing for the securing of plans for the United States public buildings. It shows itself throughout as a very complete and satisfactory document—the only point in which possibly it might be improved being in the doing away of the restriction of the competition to five

architects, debarring others from entering into the competition. It is well to select five and pay them, but do not confine the limit of choice to them, but have it open to all having the stated qualifications.

This may be of great advantage in some cases. Suppose that among the five architects chosen by the Commissioners there should happen to be no local architect who would, it would be presumed, know more about the wants of the locality, natural phenomena of the site, harmony with the buildings of the vicinity and such other matters as would not occur so well to an architect at a distance—it would give a chance then for the people to obtain possibly a better building than under the proposed restricted arrangement of the bill, and it would inure to no one's disadvantage.

If the Commissioners should find that among the outsiders a better plan could be obtained it would be its duty to select the same—and it may be considered as certain that the five picked architects would be glad to gracefully retire if such should happen to be the case.

AN ACT TO REGULATE THE PRACTICE OF ARCHITECTURE.

FORMULATED BY THE SAN FRANCISCO AND THE SOUTHERN CALIFORNIA CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE people of the State of California, represented in Senate and Assembly, do enact as follows:

SEC. 1.—Within sixty days from and after the passage of this Act the Governor of the State shall appoint ten persons, which persons so appointed shall constitute a Board, which Board shall be known and designated as the State Board of Architecture.

Five members of said Board of Architecture shall be residents of the Northern United States Judicial District of California, and shall constitute the Northern District Board for the examination of applicants for licenses to practice Architecture in this State. And five members of said Board shall be appointed from the Southern United States Judicial District of California, and shall constitute the Southern District Board for the examination of applicants for licenses to practice Architecture in this State.

The Districts shall be the same as the Northern and Southern United States Judicial Districts of this State at the time of the passage of this Act.

Said State Board of Architecture shall be appointed by the Governor as follows: Three members shall be appointed from the members in good standing of the San Francisco Chapter of the American Institute of Architects, two of whom shall be designated to hold office for two years. Three members shall be appointed from the members of the Southern California Chapter of the American Institute of Architects, two of whom shall be designated to hold office for two years; one member shall be appointed from the faculty of the State University at Berkeley, one member shall be appointed from the Teachers of the State Normal School at Los Angeles, and two members, one of whom shall be a resident of the Northern District and one a resident of the Southern District, who shall be lawyers in good standing, and who shall have been in practice for not less than five years.

Each person so appointed shall hold office for four years, unless so designated to hold office for two years And thereafter, upon the expiration of the term of office of the persons so appointed, the Governor of the State shall appoint a successor or successors to such outgoing person or persons whose term of office shall have expired, to hold office for four years, provided that the membership of the State Board of Architecture shall be composed as herein set forth.

Each member shall hold over after the expiration of his term of office until his successor shall have been duly appointed and qualified.

Any vacancy occurring in the membership of the Board shall be filled by the Governor of the State for the balance of the unexpired term in like manner.

The members of the Board shall serve without compensation from the State.

The expenses of said Board shall be paid out of the fees collected from applicants for licenses.

SEC. 2.—The members of the State Board of Architecture shall, before entering upon the discharge of the duties of their office, take and file with the Secretary of State the constitutional oath of office.

The said State Board of Architecture shall, within thirty days from and after their appointment, meet and elect from their number a President and a Vice-President, one of whom shall be a resident of the Northern District, and one a resident of the Southern District; and two Secretaries, one from each district. The Secretaries shall also act as Treasurers. The person receiving the highest number of votes shall be entitled to be Secretary, and the person receiving the next highest number of votes, be assistant Secretary. Said persons shall hold office for two years, or until their successors shall have been duly elected and qualified.

SEC. 3. The Board may adopt rules and regulations for the government of its proceedings, not inconsistent with this Act.

The State Board shall adopt a seal for its own use, and one for each of the District Boards. The seal used by the Northern District Board shall have the words "Northern District" inscribed thereon, and the one for the Southern District shall have the words "Southern District" inscribed thereon, and the Secretary and Assistant Secretary shall have charge, care and custody thereof.

The Secretary shall keep a correct record of all the proceedings of the Board, which shall be opened to public examination at all times. Six members shall constitute a quorum for the transaction of business of the State Board of Architecture, and three members shall constitute a quorum of the District Boards for the transaction of business.

Special meetings of the State Board of Architecture shall be called by the Secretary upon the written request of four of its members, and by giving twenty days written notice of such meeting, and the time and place at which such meeting is to be held, to each member of the Board.

The District Boards shall call special meetings upon the written request of two of its members made to the Secretary, and upon five day's written notice to each member of such District Board.

Within thirty days from and after the date of their appointment, the State Board shall meet to organize, elect officers, as in this Act provided for, and formulate and adopt a code of rules and regulations for its government in the examination of applicants for license to practice Architecture in this State; and such other rules and regulations as may be necessary and proper, not inconsistent with this Act. The Board may, from time to time, repeal or modify its rules and regulations, not inconsistent with this Act.

The State Board shall meet annually on the second Tuesday in April, for the purpose of transacting such business as may lawfully come before it, not inconsistent with this Act.

The District Boards shall hold their regular meetings for the examination of applicants for licenses to practice Architecture, on the last Tuesday of January, April, July and October of each year.

The Board of the Northern District shall meet in the rooms of the San Francisco Chapter of the American Institute of Architects in San Francisco; and the Board of the Southern District shall meet in the rooms of the Southern California Chapter of the American Institute of Architects in Los Angeles, and at such other times and places as they may elect, to examine applicants for licenses.

Any person shall be entitled to an examination for a license to practice Architecture upon payment to the District Board when he makes application, of a fee of fifteen dollars, which fee shall be retained by the Board; should the applicant pass a satisfactory examination by said District Board, the Secretary shall, upon the payment to him of a further fee of five dollars, issue to the applicant a certificate, signed by the President and Secretary, sealed with the seal of the District Board, and directed to the Secretary of State, setting forth the fact that the person therein named has passed a satisfactory examination, and that such person is entitled to a license to practice Architecture in this State, in accordance with the provisions of this Act; and upon the payment to the Secretary of State of a fee of five dollars, the Secretary shall at once issue to the person therein named a license to practice Architecture in this State in accordance with the provisions of this Act, which license shall contain the full name of the applicant, his birth place and age, together with the name of the District Board issuing the certificate, and date of issuance thereof. All papers received by the Secretary of State on application for license, shall be kept on file in his office, and a proper index and record thereof shall be kept by him.

SEC. 4. Any Architect in good standing, who shall show to the satisfaction of the District Board, of the District in which such Architect may reside, that he was engaged exclusively in the practice of the profession of Architecture on the date of the passage of this Act, shall be granted a Certificate without passing an examination, on the payment to the District Board of a fee of five dollars, provided such application shall be made within six months from and after the passage of this Act.

Said certificate shall set forth the fact that the person to whom the same was issued, was practicing Architecture in this State at the time of the passage of this Act, and that the person therein named is entitled to a license to practice Architecture, without having to pass an examination by the District Board, and the Secretary of State shall, upon the payment to him of a fee of five dollars, issue to the person named therein, a license to practice Architecture in this State in accordance with the provisions of this Act.

Each licensed Architect shall have his license recorded in the office of the County Recorder in each and every County in this State in which the holder thereof shall practice, and he shall pay to the Recorder the same fee as is charged for the recording of deeds. A failure to have his license so recorded shall be deemed sufficient cause for revocation of such license.

SEC. 5. Within six months from and after the passage of this Act, it shall be unlawful, and it shall be a misdemeanor, punishable by fine of not less than fifty dollars nor more than five hundred dollars, for any person to practice Architecture without a license in this State, or to advertise or put out any sign or card, or other device, which might indicate to the public that he was an Architect.

Provided, that nothing in this Act shall prevent any person from making plans for his own buildings, nor furnishing plans or other data for buildings for other persons; provided the person so furnishing such plans, or data, shall fully inform the person for whom such plans or data are furnished, that he, the person furnishing such plans, is not a licensed Architect; and provided further, that the person so furnishing plans or other data for building shall not be entitled to recover any fee or compensation for such plans, data or services.

Architect's licenses issued in accordance with the provisions of this Act, shall remain in full force until revoked for cause, as hereinafter provided for in this Act.

A license may be revoked for dishonest practices, or for gross incompetency in the practice of the profession, which questions shall be determined by the District Board of the District in which the person whose license is called in question shall reside, or shall be doing business; and upon a full investigation of the charges by the District Board, an opportunity having been given the accused to be heard in his own defense or by counsel; and upon the verdict of at least four members of the District Board, the Board may issue its certificate to the Secretary of State, revoking the license of the person accused; and the Secretary of State shall thereupon cancel such license. And on the cancellation of such license, it shall be the duty of the Secretary of the District Board to give notice of such cancellation to the County Recorder of each County in this State, whereupon the Recorder shall mark the license recorded in his office, "Cancelled".

After the expiration of six months, the person whose license was revoked, may have a new license issued to him by the Secretary of State upon the certificate of the District Board, by which the license was revoked.

Every licensed Architect shall have a seal, the impression of which must contain the name of the Architect, his place of business, and the words "Licensed Architect", with which he may stamp all plans prepared by him.

This Act shall take effect from and after its passage.

THE GOVERNMENT BUILDINGS BILL.

WE publish herewith a copy of the Bill relating to the re-organization of the Government Architects' office, which was introduced into the House of Representatives by Mr. McKaig, and into the Senate by Senator Brice, say the *American Architect*, under the following circumstances:

This Bill originated with a few architects in New York City, who happened to learn that notwithstanding the controversy between Secretary Carlisle and the American Institute of Architects, the Treasury Department was anxious to reorganize the Supervising Architect's office, and to have a bill introduced to this effect, because of the many objection-

able and illegal features of previous bills—notably the "Tarsney Bill"—which made them undesirable as well as inoperative.

The "McKaig Bill," which was draughted by Mr. George B. Post, of New York, in consultation with these New York architects and with the Treasury Department, embodies an entirely new idea which is based on the very satisfactory lines under which a number of Government Departments—notably the Light-house Department—have been conducted most successfully for a number of years; by placing the initiative and professional work under the management of an expert board, of the highest standing, under whose direction the work would be distributed for the best advantage of the country, of the work, and of the profession; leaving the administrative work in the hands of the Government, where it belongs.

The Bill, as originally draughted, was revised a number of times, by the Committee of Architects on the one hand, and by the Treasury Department on the other, and as introduced was entirely satisfactory to all parties concerned. Though many of the minor details may not apply to individual cases in individual sections of the country, they had to be adjusted so as to cover the entire territory, and also so as to meet administrative, legal and other objections not generally appreciated by the profession at large. The powers of the Commission are such as to enable them to modify their details from time to time, as they find it necessary and wise.

The principle of the Bill, namely, the instituting a Commission of high character to have charge of the architectural work of the Government, and to distribute the work amongst the most skillful architects in the country, is unquestionably a correct one.

The Bill has received the approval of the Secretary of the Treasury. It has passed the Committee on Public Buildings and Grounds, of the House, whose indorsement could not be stronger, and the Bill is now regularly before the House. Owing to its introduction at the end of the last session of Congress, at a time when the House was entirely absorbed by the Tariff revision, it was impossible to have a day set for its consideration and passage; therefore it had to go over to the present session of Congress.

In the House Committee's report to the House, recommending the passage of the Bill, they state, among other things:

"Your committee do not believe that the beneficial results that should be obtained, are obtained under the existing methods of planning and constructing public buildings of the United States.

"While the employment of the best artistic thought, and best and most approved systems of construction and equipment ought to be represented in the public edifices of this great nation, the contrary of these propositions is the result obtained under existing methods.

"Your Committee are advised that the best and highest types of artistic thought and architectural skill in European countries is found in the Government buildings of those countries, while in this country the reverse is the rule, and superiority of architectural design is represented in State, Municipal and private buildings, and not those erected by the General Government.

"A comparison of modern buildings, erected by private citizens and corporations, with those belonging to the Government of the United States, will show, as to the former, constant progress in construction and artistic expression, and continual increase in economy of construction, while in the case of the buildings of the United States there has been but little, if any, advancement. The buildings constructed recently by the United States, as compared with those constructed a quarter of a century ago, show a marked deterioration of artistic quality. The cost has been, relatively and positively, much greater that those of private buildings of the best type.

"Your Committee has been furnished reliable and trustworthy information and data, showing the cost of the best type of buildings constructed for States, municipalities, corporations and private citizens, ranges 38 to 50 cents per cubic foot of space, while the cost of buildings constructed by the United States ranges from 50 cents to $1.00 per cubic foot." * * *

"The conditions and results which your Committee thus call to your attention, necessarily follow the methods and practices now employed by the Government." * * *

"It now transpires that the time of the Supervising Architect is wholly employed in matters of administrative detail, and the architectural work of the office, the plans, designs and specifications, are prepared by mere copyists—cheap clerks." * * *

After entering elaborately into the present duties of the Supervising Architect, and showing the physical impossibility for one man to find any time for designing, the Report continues:

"The Supervising Architect rarely sees one of these buildings while in course of construction. Its construction is generally under the supervision of some local carpenter or builder, who never made any pretense to architectural knowledge or study; whose appointment was secured not because of his skill, but because of the political influence he could marshal, and whose greatest solicitude is to prolong the tenure of his employment by delaying the completion of the work." * * *

"A building, which, if the property of a private citizen would be constructed in months, when erected by the Government requires years for its completion. * * A public building at Detroit, Mich., where the construction was authorized eleven years ago, and $1,300,000 appropriated by Congress years since, the foundation-walls are not yet completed.

"Indeed, the abuses in the method above referred to, have become so serious that the Committee cannot conscientiously recommend public buildings at many places where the economical and convenient transaction of the business would require or justify such buildings could they be provided at a cost not greatly exceeding the necessary expenditure by a private owner for similar purposes.

"Of the Bills reported from this Committee during the present session, many are so reported only under the assumption that the buildings contemplated can be erected under some plan less wasteful than now in operation.

"The scope and purpose of the measure herewith presented is designed to remedy the many evils herein pointed out. To give to the country a better type of architecture in its buildings, and to stop the wasteful extravagance which is the necessary result of the present methods." * *

"The measure does not abrogate or take from the Supervising Architect any of the functions or authority belonging to the office, which, under existing conditions, *he is capable of performing*. He will remain and continue the representative of the Government, and perform all the duties that now pertain to his office, excepting the designing and preparation of drawings and specifications for such buildings, and the local supervision shall be subject to his approval." * *

"In fact, this measure is intended to make him what the title of his office indicates, the Supervisor of Architects; not the Government's architect, but the supervisor of the architects of the Government's works. Therefore, your Committee recommend the passage of the Bill."

In the Senate, the Bill was introduced in the Senate and referred to the Committee on Public Buildings and Grounds too late for its consideration, and has not yet been reported upon by this Committee.

To summarize: *In the House*, the Bill is regularly before the House, and as soon as a day can be set for the discussion of the same, it can be passed. *In the Senate*, the Bill is before the Committee, and as soon as it can be reported to the Senate and a day set for its discussion, it can be passed.

The Bill has received the approval of the Committee of the House, of the Secretary of the Treasury, of the Press, and of the profession. It has been before the profession for nearly a year. Numerous meetings of different professional societies and notably of the American Institute of Architects have taken place in the meanwhile, and its endorsement has been unanimous. Many Senators and Congressmen have been seen individually, and without exception have commended the Bill, and promised their support; many of them in writing. Up to the present date there has not been a single objection raised to the Bill; by the Public, by the Government, by the Representatives of the Government in the Senate or House, or by the profession; on the contrary, it has received the most positive and hearty endorsement.

The Bill should pass both Houses with little or no trouble, because:

1. It is purely administrative in its character.

2. Its object is to correct an inefficient system which was instituted years ago, and which has become not only obsolete, but positively pernicious.

3. It does not interfere with the present system, in so far as that system is efficient, but tends to relieve the present system of a burden to which it is not equal, and to enact proper measures to provide for this part of the work.

4. It asks for no appropriations or expenditure of money, but aims on the contrary, to effect economy in the expenditure of the moneys, and to raise the character of the work to the highest standard of the present age.

5. In raising the standard of the work, it will raise the standard of the art, create new incentive, bring forth new men, new opportunities, and result in covering this country with monuments which will eventually compare with those of other countries, and in time, perhaps, excel them.

6. It has received the hearty approval of everybody concerned or interested, on whichever side of the question they may be.

7. It will not legislate out of office any of the present office-holders—many of whom have served the Government faithfully for many years—because the work now in hand under the present system, and the maintenance of the buildings now completed, will demand the services of this force for many years to come, and it only applies to future work.

8. It will relieve the Secretary of the Treasury of all work of an expert character, for which he must necessarily depend upon outside advice, by placing at his disposal in this connection, an expert Board of the highest standing.

9. Not only will the buildings be equal to the best types that are erected in the United States, both artistically and constructively, but they will be built, as stated by the Committee of the House, at a saving of at least 30 per cent on the actual cost of construction, at least three years in the time of construction, saving not only the interest on the cost of the land and the cost of construction, besides salaries of superintendents, watchmen, etc., during this period—the cost of repairs and maintenance due to suspension of the work, but also three year's rent for temporary quarters pending completion of buildings.

10. It can be demonstrated by figures that under the new Bill, with better buildings, erected in a much shorter time, the cost of the construction of the buildings, the commissions of the architects, and the necessary appropriation for the Supervising Architect's office, the United States Government would save at least one million dollars per annum, as compared with the present system.

J. M. Carrere, *Secretary*.

By order of the Legislative Committee on Government Architecture:—

Permanent Committee: Bruce Price, *Chairman*; Ed. H. Kendall; John M. Carrere, *Secretary*.

Advisory Committee: R. M. Hunt, *Chairman*; Chas. F. McKim and Geo. B. Post.

A BILL TO PROVIDE FOR THE SECURING OF PLANS AND FOR THE ERECTION OF THE PUBLIC BUILDINGS OF THE UNITED STATES.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the President, by and with the advice and consent of the Senate, shall appoint a commission on public architecture consisting of three architects of high scientific and artistic attainment and large practical experience, and two officers of the Engineer Corps of the United States Army. If necessary, a separate appointment of any or all of three members of the commission who are architects may be made for each building under consideration, and members of the commission for one building may act upon other buildings. That the commission, under the general direction of the Secretary of the Treasury, shall discharge all the administrative duties relating to the procuring of designs and the appointing of architects for all buildings hereafter erected by the Government of the United States.

Section 2. That the Secretary of the Treasury shall be the president of the commission *ex officio*, and the Supervising Architect of the Treasury Department shall be a member of the commission *ex officio*. In the absence of the president of the commission, one of the members shall be elected as chairman by ballot, and he shall preside at the meetings and perform such other duties as the rules of the commission may prescribe; and the Supervising Architect of the Treasury shall act as secretary of the commission.

Sec. 3. That the secretary of the Treasury shall convene the commission whenever, in his judgment, the exigencies of the service require it.

Sec. 4 That the commission shall adopt rules and regulations governing competition in the procuring of designs, and for the government of its meetings and the general performance of its duties. The members of the commission shall be paid their actual expenses and subsistence and a *per diem* allowance of $10 while actually engaged in the performance of their official duties, but no *per diam* allowance or salary shall be allowed to any civil or military officer on account of his being employed on the commission, but his actual traveling expenses and subsistence shall be paid while engaged thereon.

Sec. 5. That in case the limit of cost provided by law is $100,000 or over, the commission shall select by ballot, for

each building, five architects to prepare designs in competition; in case the limit of cost is less than $100,000, the commission may, in its discretion, select by ballot an architect without competition. No architect shall be eligible for entering as a competitor, or for appointment, who has not had at least ten years' experience as an architect-in-chief, and unless he can satisfy the commission, through work already done by him, or otherwise, that he is competent to take charge of the economical construction of the building. The commission shall cause to be made and issued to competing architects, surveys, schedules of requirements for the building, limitations of cost, and all facts which might control or influence the character of the required design. The commission shall specify the number and character of the drawings required, and fix a definite time for their completion. The Secretary of the Treasury, upon the recommendation of the commission, shall pay to each unsuccessful competitor, to reimburse him for expenses incurred in preparing the competitive drawings, the following amounts: For designs for buildings to cost not more than $150,000, the sum of $150, and for each and every $100,000 of the limit of cost of the building above that amount, the additional sum of $100; but in no case shall more than $1,000 be paid to any unsuccessful competitor.

SEC. 6. That the commission shall reject and return to the author any drawings which have failed to exactly comply with the requirements and regulations adopted by the commission for the competition, and no compensation for their preparation shall be paid, and the author thereof shall be debarred from all further participation in the competition. The commission shall carefully examine the drawings of each competitor in competition and shall select one design as the design of the proposed building, and shall recommend its author as the architect for that building and return forthwith all other drawings to their authors. The Secretary of the Treasury shall thereupon appoint the architect so recommended and he shall perform all the customary duties performed by an architect in private practice, namely: The making of all preliminary sketches, the modification of his designs to meet possible requirements of the commission, the preparation of a set of general working drawings to procure estimates; the preparation of a set of general details on a large scale, a set of full-size drawings for moulded, carved or ornamental work, and a set of all other original drawings and specifications required by the commission. He shall supervise the construction of the building, and no payment shall be made to any contractor until the certificate of the architect has been received by the Secretary of the Treasury that the work has been executed in conformity with the contract. He shall file a complete set of the construction drawings in the Treasury Department, from which all duplicates shall be paid for out of the appropriation for the building. The architect shall be paid for his services a fee of five per centum upon the total cost of the work and the usual traveling expenses. The expenses of the commission and the fees of the architect shall be paid by the Secretary of the Treasury out of the appropriation for the building in the erection of which they were incurred.

SEC. 7. That the Secretary of the Treasury, upon the recommendation of the commission, shall authorize the architect to employ a competent clerk-of-the-works, at a salary to be established by the commission, and he shall be paid for his services out of the appropriation for the building.

SEC. 8. That the Supervising Architect of the Treasury Department, under the direction of the Secretary of the Treasury, shall be the representative of the Government in all matters connected with the erection and completion of public buildings and the payment therefor. He shall receive proposals for the work, and, with the approval of the architect of the building, he shall award the contracts therefor. He shall perform all other duties that now pertain to his office, except such duties as are vested by this Act in the architect of the building.

SEC. 9. That all Acts and parts of Acts inconsistent with this Act are hereby repealed.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines, on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

CORRESPONDENCE

The Editor is not responsible for any opinions of Correspondents.

To the Editor of the California Architect and Building News.

IN looking over the proposed Bill for regulating the practice of architects there are quite a number of things that deserve consideration and wherein it appears to me that it might be improved.

1st. In the composition of the Board it is unwise to limit

the examining architects to members of the Chapter of the American Institute of Architects—until such Chapters themselves have a more strict examination into the merits of their own members—if such members had to pass an examination themselves before becoming such they would then have a certain standing in the examination of others, and to commence this matter right such should be the case.

The other members of the board have no *raison d'etre*. If there were Professors of Architecture at the Berkeley or Stanford University I should say let thom be on the Board, otherwise have no professors. The lawyers are certainly out of place—might with just as much reason put architects on the Board of Examiners for Law Students. If they are put their for legal advice make them such but to have no voice in the examination or other actions of the Board.

2d. It would seem that semi-annual examinations would be sufficient—instead of quarterly.

3d. Although naturally the most likely place to hold the examinations would be at the rooms of the Chapter, still I believe it would be better to leave such a small matter as this in the hands of the examiners themselves and not bind them down to certain locations.

4th. The clause calling for an architect to record his license in every County in which he may practice gives him needless trouble. It seems to me quite sufficient for all practical purposes to have his license recorded in the County wherein is his principal place of business—and when he has to lose his license because of his forgetfulness in omitting to record it in the County where he may be architect for some little summer cottage—the punishment hardly fits the crime.

5th. In the case of such a serious matter as the Revocation of an Architects' License for dishonest practices or gross incompetency—it should be left to the *State Board* to decide—as in a case of any local prejudice, such prejudice would not so likely get in its work as if the trial should be left to the *District Board* of the District in which the accused practices, if it needs must be decided by a District Board let the Board of the other District take the case up.

These few criticisms I make in the best of spirit and hope they may tend to improve the proposed bill.

Yours, etc., W. J. C.

WASHINGTON STATE CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

IN the latter part of March, 1894, several architects of the State of Washington, believing that the time was ripe for the formation of a Chapter of Architects, met in the office of one of their number and considered the feasibility of such organization.

At an adjourned meeting held in April with enthusiasm, the Chapter was born and a Constitution and By-Laws adopted; officers for the current year, and to serve until the annual meeting in January, 1895, were elected; May 10th, at Tacoma, the organization was ratified and perfected. A Charter was granted by the American Institute, and the Washington State Chapter of the American Institute of Architects was full fledged. A series of amendments to the Constitution and By-Laws in harmony with those of the Institute have accordingly been proposed and submitted to the members for their consideration.

Meetings, with good attendance, have been held regularly on the second and last Thursdays of each month, with the exception of the months of November and December.

The Chapter has kept constantly in mind the importance of interesting the general public in Art and Professional practice. Special papers have been prepared and read at several of the meetings which were held at the Chamber of Commerce in Seattle and City Council Chamber in Tacoma, and subjects of general interest discussed.

The first paper read was "Venice, its Color and Line" by Mr. Willcox, April 12th, then followed, successively, a timely paper on "Competitions" by Mr. Bebb, April 26th; "Architects as Pioneers" by Mr. Bullard, May 10th; President Boone's "Address" May 10th; "The Ethics of the Profession" by Mr. Evers, June 14th; "How to Hake Home Beautiful" by Mr. Willcox, June 28th; "Abuses in the Office of the Supervising Architect of the Treasury" by Mr. Willcox, July 15th; "Testing of Piles" by Mr. Bebb, August 26th; "Laying out of Cities" by Mr. Willcox, August 26; "Fire Proof Construction" by Mr. Bebb, September 13th; "Errors in House Construction" by Mr. Willcox, November 9th; "Building Materials of the Puget Sound Country" by Mr. Talcott, December 11th; with one yet to be read "On the Architect as a Limited Agent" by Mr. Saunders.

The Council believes it is a matter of congratulation, that, with a practicing membership of Thirty-four, with Three Honorary Members, or a roll of membership of Thirty-seven members, this, the youngest Chapter in the United States, save one, we now rank Sixth in a list of twenty-six or more Chapters, and we believe also that as the Society increases in influence, it will serve to a corresponding advantage of its members in many practical ways.

LIST OF OFFICERS AND MEMBERS OF THE WASHINGTON STATE CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

W. E. Boone, Seattle, Wash., President; G. W. Bullard, Tacoma, Wash., 1st Vice-President; William H. Willcox, Seattle, Wash., 2d Vice-President; Charles W. Saunders, Seattle, Wash., Secretary; Cecil S. Evers, Seattle, Wash., Treasurer.

MEMBERS OF THE COUNCIL.

Officers of the Chapter (Ex-officio) and Wm. Farrell, Tacomo, Wash.; Albert Sutton, Tacoma, Wash.

HONORARY MEMBERS.

Prof. J. M. Taylor, University of Washington; Chas. L. Denny, Seattle, Wash.; A. W. Conant, Seattle, Wash.

COMPLETE LIST OF MEMBERS.

Chas. H. Bebb, W. E. Boone, A. B. Chamberlin, A. W. Conant, Chas. L. Denny, Cecil C. Evers; A. V. Hector, E. W. Hooper, E. W. Houghton, T. Josenhans, Emil de Neuf, Chas. W. Saunders, Carl Siebrand, H. Steinmann, Jas. Stephen, Prof. J. M. Taylor, A. Wickersham, Wm. H. Willcox, Seattle, Wash.; G. W. Bullard, C. A. Darmer, Wm. Farrell, L. C. Houser, Louis Mendel, R. L. Robertson, A. J. Russell, Albert Sutton, Chas. B. Talbot, Tacoma, Wash.; L. M. Boardman, Mr. Cutter, John K. Dow, Mr. Malmgren, H. Prousse, L. L. Rand, Spokane, Wash.; H. L. Copeland, Olympia, Wash.; C. Ferris White, Everett, Wash.; John Parkinson, Los Angeles, Cal.; G. H. Parks, Kansas City Mo.

THE FIRST ANNUAL MEETING.

The first annual meeting of the American Institute of Architects, which was held at the Chambers of Com-

merce rooms yesterday, brought out quite a gathering, and developed the fact that the Chapter stands sixth in the United States in the number of members. A petition to the Regents of the State University for the establishment of a Chair of Architecture and the Building Arts was adopted and a valuable report on the building materials of the state was presented. A pleasant interruption in the proceedings occured when the Chapter paid a visit to the Denny Clay Company's works at Van Asselt on a special train, as the guests of the company.

The meeting was delayed by the failure of the members from Tacoma to arrive at the appointed time, which was 10:30, and the assemblage was not called to order till 11:30 by President Boone. Those present were: George W. Bullard, William Farrell, Albert Sutton and H. A. Russell, of Tacoma; Charles H. Babb, A. B. Chamberlain, C. C. Evers, C. W. Hooper E. W. Hampton, E. De Neuf, C. W. Saunders, James Stephen, William H. Willcox and A. Wickersham, of Seattle, active members, and Charles L. Denny and A. W. Conant, honorary members.

President Boone welcomed the members, and after the reading of the minutes he made the following address:

In the month of April, 1894, the first practical step in the organization of this Chapter was taken. A provisional Chaper was at that time founded. On the eleventh of May, 1894, at a meeting held in Tacoma, the work of this provisional Chapter was ratified; then Constitution and By-Laws under which it was started were adopted; and the officers chosen by it were continued as the officers of the State Chapter. This, therefore, is the first annual meeting of the Chapter. The regular monthly meetings have been held in Tacoma and Seattle alternately.

The American Institute of Architects has granted us a Charter, under the name of the "Washington State Chapter of the American Institute of Architects." This makes us an integral part of that important body; and it is surely worthy of remark that while we are probably the youngest Chapter in the United States, we rank as sixth in point of membership. This very high rank in our infancy bears striking testimony to the rapidity with which towns and cities are springing up all over this wonderful young State. If our building operations had not attained relatively gigantic proportions, we could not have so large a membership.

It affords me pleasure to say that in my opinion this Chapter has already exercised a beneficial influence upon our profession in this State. Papers of an interesting and instructive character have been read and discussed at our meetings. Men of learning, ability and experience have given us the benefit of their reflections and observations, and have thus invested our meetings with deep and practical interest.

The American Institute of Architects has for some time past made strenuous efforts to procure the adoption of improved methods in designing and constructing Government buildings. The inartistic character of these buildings in general is at first sight a reproach upon the state of architecture in the United States, and is felt by the Institute as a reflection upon the whole body of Architects.

This Chapter lost no time in seconding these efforts of the Institute, which should be encouraged and upheld wherever there is an architect who takes pride in his profession.

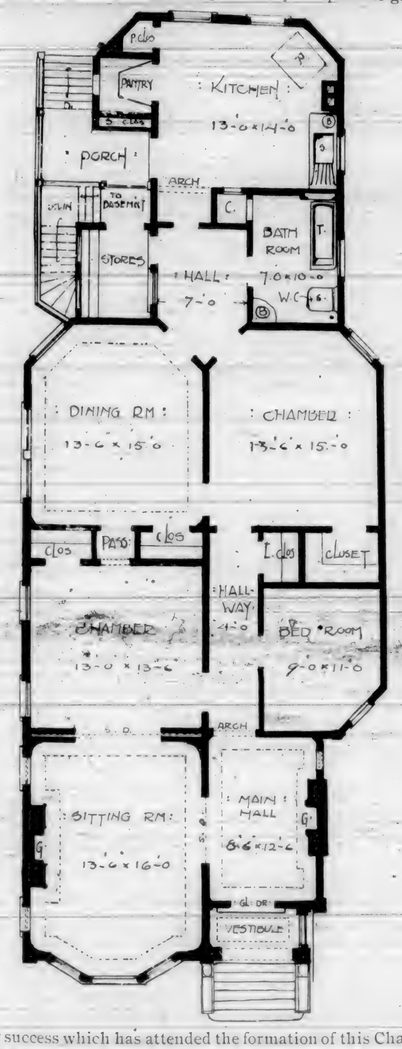
I recommend that as soon as practicable this Chapter take the steps necessary to the establishment of an Institute of Building Arts. This can be commenced with Exhibits of building materials, which would serve effectually to bring into prominence the varied and extensive resources of the building trades in this State.

The number of applicants for instruction in architecture in the principal cities of Washington is already quite large. With the high rank in Chapter membership which has been noticed, it would seem proper that the University of Washington, whose main building is now under construction should establish a Chair of Architecture. This Chapter may appropriately aid in this matter. The State at large is deeply interested in the character and learning of the Architects who are to impress their ideas in a conspicuous way upon our growing and ambitious young cities.

I am satisfied that after due consideration the enlightened

public opinion of the State will approve the establishment of a Chair of Architecture in our new University.

There are other subjects that might be fitly discussed in your President's address; but as there is a considerable amount of business to be transacted by you at this meeting, I have thought it better to touch but lightly upon a few topics. In conclusion, I congratulate you upon the gratifying success which has attended the formation of this Chapter, and I thank you sincerely for the kindness and consideration shown to me as its first President.



The report of the Committee on Tabulation of the Building Material of the State was most exhaustive and complete in its detail and a full report of which will be published in the February issue of the CALIFORNIA ARCHITECT AND BUILDING NEWS.

A CHAIR OF ARCHITECTURE.

The committee on recommendations of the president indorsed his suggestions, and urged the Chapter to place before the Regents of the University a petition for the establishment of a Chair of Architecture.

A communication was received from the Secretary of the American Institute desiring the Chapter to use all the influence possible with the State's Senator and Representatives in Congress to secure the passage of House Bill No. 7470, which provides for a reform in the manner in which designs for Government Buildings are made and selected.

THE NEW OFFICERS.

After a short recess the Chapter proceeded to elect officers for the ensuing year. The election resulted as follows: President, George W. Bullard, Tacoma; Vice-President; A. Wickersham, Seattle; 2d Vice-President, L. M. Boardman, Spokane; Secretary, C. W. Saunders, Seattle; Treasurer, C. C. Evers, Seattle; Council, Albert Sutton, of Tacoma, W. H. Willcox, of Seattle, and officers ex-officio.

A vote of thanks was tendered the Denny Clay Company and the Chamber of Commerce for courtesies shown.

The reading of papers was postponed till the next meeting. The Chapter adjourned at six o'clock to meet on February 14th, in Tacoma.

MEETINGS OF THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

ADJOURNED and regular meetings of the San Francisco Chapter of the American Institute of Architects, were held during the past month for the consideration of the proposed Act to Regulate the Practice of Architecture in the State of California.

A committee was appointed to confer with a similar committee from the Southern California Chapter and the draft of the law which was agreed upon will be found in another column.

The Board of Freeholders now at work on the making of a New Charter for the City and County of San Francisco, were communicated with to inform them that it was the opinion of the Chapter that provision should be made for a Board of Public Works with power to formulate and enforce rules and regulations to govern the erection and alterations of buildings.

PROTECTING CANADIAN ARCHITECTS.

DOUBTLESS as the result of representations made from time to time by the architectural Associations of Ontario and Quebec, it is gratifying to learn that the Government has resolved to change the method of appraising the value of architectural plans imported for use in the erection of buildings in Canada. We are informed that new instructions have lately been issued by the Government to customs officials, under which architectural plans passing through the customs will in future be charged a duty based on the cost of the building to be erected. It has likewise been stated, though with what authority we know not, that the new regulations are to be retroactive, and that under them duty will be collected on the cost of the Ortario Legislative buildings, the Toronto Board of Trade, and other buildings erected during recent years from the plans of foreign architects.—*Canadian Architect and Builder.*

BOOKS AND PERIODICALS.

LIPPINCOTTS' Magazine for January 1895, has for its complete Novel "The Waifs of Fighting Rocks" by Captain Charles McIlvaine. The scene is laid in the mountains of West Virginia, and the tale is one of adventure, love jealousy among the mountains. "By Telephone," a stirring story by Francis Regal, shows how a plucky reporter defeated a comspiracy and brought the criminals to justice. The Christmas stories are promptly on hand for the holidays; "With the Autocrat" recalls some notable private utterances of Dr. Holmes. We always welcome the coming of this readable magazine with interest.

THE NEW SCIENCE REVIEW for January, 1895. This handsome quarterly comes to hand with its usual readable contents, J. M. Stoddart the editor appears to fulfill the promise made in the start of having a miscellany of modern thought and discovery, keeping a little ahead of his contemparies in bringing the discovery of to-day before the people in a way that cannot but please those who take an interest in Scientific Facts, without being called men of science and this class includes by far the largest number of readers. We notice that the question of "What is Electricity" is the title of three articles in the January number.

The Kalendar of the ROYAL INSTITUTE OF BRITISH ARCHITECTS, 1894-95, comes to hand in its usual neat and attractive form. An article upon the Progressive Examinations qualifying for Registration as Probationer and Student cannot fail to be of interest to architects in this country. Space will not allow us to make extended extracts from the rules. The following advice to applicants before entering an architect's office, are certainly wise and as true on this side of the water, as upon the other. The preliminary, qualifying for probationer. The subjects comprised in this examination are those in which proficiency should be attained by the applicant before entering an architect's office, and it is desirable that special attention be given to them before he leaves school.

Clear and well-formed hand writing, correct spelling, grammar and punctuation are indispensable. Powers of observation and of graphic description, facility of composition and lucidity in the expression of ideas, should be carefully cultivated, as being of the utmost value in the prosecution of further studies, and in the work of later years.

Arithmetic, algebra, and plan geometry should be familiar to the applicant, and a knowledge of their application in the solution of simple problems in elementary mechanics and physics should be acquired.

The geography of Europe and the history of England from the Norman Conquest to the end of the Tudor dynasty should be well studied, regard being had to the connection between the history of the country and its architecture.

A good knowledge of French is essential, and of German or Italian very desirable, and a clear understanding of the Continental metrical system will also be useful.

Geometrical drawing and the elements of perspective are indispensable subjects of study, and should receive particular attention; while freehand drawing with rapidity and precision from the cast and the antique, and sketching with accuracy, should be carefully cultivated. Reasonable proficiency in these subjects is of the first importance.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

CONSTRUCTION OF PARTY WALL AGREEMENT.—A deed between W. and J. owners of adjoining lots, and the former's mortgagees, recited that it was agreed that J. should convey to W. 5 ¾ inches lying between the western wall of his building and his boundary line, and pay W. $400, in consideration of which W. should execute a convenant to preserve the easement for light and air unto J., his heirs, assigns, etc., and also use five ¾ inches for the purpose of erecting a wall, sixteen feet high only, to the eastern end of a certain addition which W. proposed to so build that its eastern wall should rest on the boundary line between the lots, and that neither W. nor any person claiming through him should make any erection on his lot or such strip higher than sixteen feet, unless there was left between the buildings a clear space of thirty-six inches from the height of sixteen feet upward. It was held, that J. could put windows in a seven story party wall erected by him, six ¾ inches of which stands on W's ground.

Weigman v. Jones, Supreme Court of Pennsylvania, 30 At. Rep. 198. 183.

LIABILITY FOR EXTRAS FOR CHANGES ORDERED BY BUILDING INSPECTORS.—After work was commenced on a church under a contract providing that no extras should be paid for unless agreed to in writing signed by the parties, city building inspectors ordered changes, a sketch of which was prepared by the architect, and the contractor was directed to make such changes. Though there was no express contract for the extras made necessary by the order, it was the duty of the church corporation to see that the order was obeyed, from which arose an obligation to pay for the work necessary therefore, done with the consent of the corporation, under the direction of its architect.

Cunningham v. Fourth Baptist Church, Supreme Court of Pennsylvania, 28 At. Rep. 490. 113.

WHEN CONTRACTOR HAS NO LIEN.—The statute giving a lien to any one who furnishes labor or material for a building "under contract with the owner or his agent, trustee, contractor or contractors," does not give a lien to one furnishing labor or material under a contractor with a lessee in the absence of authority from the owner. The owner of land is not affected by a judgment foreclosing liens for improvements against his lessee if he was not made a party to the action.

Penfield v. Harris, Court of Civil Appeals of Texas, 27 S. W. R. Rep. 762. 86.

EFFECT OF ABANDONMENT OF BUILDING CONTRACT BY CONTRACTOR.—A contractor, to whom payment was to be made only upon approval of the work by the architect, gave complainants an order payable out of the amount to become due, which the owner accepted on condition that the architect approve the work. The contractor abandoned the work before completion. A bill in equity to enforce payment of such order, and for an accounting of the amount due the contractor, was demurrable, as complainants had an edequate remedy at law. Where a contract provides that if the contractor fail to complete the building as agreed the owner may do so, and deduct the expense from the contract price, the contractor cannot abandon the work, and compel the owner to complete it, and account to him for the balance of the contract price.

Bernz v. Marcus Snyre Co. v. Court of Errors and Appeals of New Jersey, 30 At. Rep. 21. 139.

CONSTITUTIONAL LAW RESTRICTING HOURS OF WORK.—The statute which forbids contractors for city work in the city of Buffalo to accept more than eight hours for a day's work, except in cases of necessity, does not "abridge the privileges of citizens" or deprive any citizen of his rights or privileges.

People v. Beck, 30 N. Y. Supp. 473, Supreme Court of Buffalo, General Term. 50.

BUSINESS MOSAICS.

The Schenck Patent Swinging Hose Reel heretofore manufactured by the W. T. Y. Schenck has become the property of the Revere Rubber Co., whose San Francisco Store is located at 527 Market street. The Company is one of the largest and its reputation as manufacturers of high class goods is well established. The Schenck Reel will be a feature of its business and receive the attention so valuable a patent deserves.

When Adam in bliss, asked Eve for a kiss, she pucked up her lips with a coo; gave a look so ecstatic, and answered emphatic, "I don't care A-dam if you do."—*Clay Record.*

The J. L. Mott Iron Works, New York, Boston, Chicago, St. Louis and San Francisco. See their advertisement on p. x of this journal. The Imperial Porcelain Roll Rim Roman Bath cannot be improved upon for fine appearance, durability and perfection from a sanitary stand point, while entiling no labor of scouring or burnishing, merely wiped out with a sponge and the tub is cleaned. For information and circulars apply to M. S. James, Pacific Coast representative, room 35, Flood Building, San Francisco.

Take after his father—"The boy with sawed-off trowsers."—*Clay Record.*

Edward B. Hindes & Co., 411 Mission street, San Francisco, is the place to go if you want Hill's Patent Inside Sliding Blinds, Perfection Window Screens, Latest Improved Venetion Blinds, Patent Self Coiling Burglar and Patent Self Coiling burglar and fire-proof Steel Shutters, or Rolling Wood Partitions. Send for a catalogue and prices if you have not time to call and examine for yourself. Don't go if you can't resist temptation for you are sure to leave an order.

Miss PEART—"What column do you read first in the paper?" Miss TEAR—"The society column. Why?" Miss PEART—"I should think you would be more interested in "Male help wanted."—*Philadelphia Inquirer.*

The attention of those about to build, is called to the advertisement of Joseph Budd the well known manufacturer of sanitary appliances, page vii of this journal. The medals and diplomas awarded him at the State Fair in 1888 and 1889, are all-well enough in their way but the reliability of the man, and the quality of the goods furnished by his house, prove that the old saying "Actions speak louder than work," is true, and accounts for the popularity that the public have manifested in keeping him busy filling orders, even in dull times—what will it be when business revieves—don't forget the number 575 Mission street, San Francisco.

Bacon—"What are you doing with a picture of a foot-ball player pinned to your coat?" EGBERT—"Oh, yes! My wife pinned that there so as to remind me to have my hair cut."—*Yonkers Statesman.*

Clawson's Patent Chimneys, most complete and safest in the market, 1340 Market street, San Francisco. Call and be convinced.

Vulcan Iron Works, 135-145 Fremont street, San Francisco. Architectural and ornamental iron works, also stable fixtures, hay racks, feed boxes, stable guards and harness fixtures, etc., etc. See advertisement on page x this journal.

Mrs. KNERVY rang the bell for the domestic. "Nora," she said, when the kitchen lady appeared, "I'll feed the canary myself after this. The doctor says I am to take more exercise."—*Chicago Tribune.*

The Paraffine Paint Company at 116 Battery street, will be found a great convenience to the householder, now that rainy weather is at hand, many a leaky roof only wants a good coat of paint, to make it water tight, nor are their efforts to do good to the public confined to this city, Mr. E. J. Judah is agent for the company at 221 South Broadway, Los Angeles. After the present rain points out the weak spots in your roof there will be plenty of time to apply Paraffine Paint before the rainy season commences for good.

Higbee—"By Jove, old man, you are looking extremely well. Been taking a vacation? BRADFORD—"No; my wife has."—*Truth.*

To those in want of mantels, grates and tiles, in fact anything in the way of heating apparatus we would say go to W. W. Montague & Co., their main store in San Francisco, with branches at Los Angeles and San Jose.

She—"Doesn't football make demons of men?" HE—"No; it frequently makes angels of them, though."—*Yonkers Statesman.*

If you specify Samson Spot Cord you can tell at a glance that no other cord is substituted; warranted free from waste and imperfections of braid. Samson Cordage works, Boston, Mass. Those that have the bother of the cord that is unreliable, will rejoice that their troubles are ended if they use their cord.

Deacon EBBONIE—"Kunnel, I'se come to ax a favor ob you." COLONEL FAIRFAX—"To help you out of debt?" DEACON EBBONIE—"No, sar; to help me into debt—wif yo'self!"—*Truth.*

Who will be the first to order a memorial window in memory of some dear friend for the year 1895, any in want of something in that line that will be an honor to their church, and a pleasure to themselves should go to the California Art Glass works. Wm. Schroeder, President, 105 Mission street, cor. Spear street, San Francisco.

"It's a good idea to make light of your troubles." "I do," replied Happigo. "Whatever a creditor sends me a letter I burn it."—*Washington Starr.*

Our friend W. W. Wickersham still continues at his old quarters, 1125 York street, San Francisco to do business as contractor and builder those who employ him once always want him to work for them again.

ANNUAL BUILDING SUMMARY.

IN the following table we present the number and value of buildings erected in San Francisco during the past year, as shown by the contracts filed at the City Hall.

FOR FIRST SIX MONTHS.—1894.

1894	No. of Building Permits	No. of Contracts	Brick Building Value.	No. of Building Permits	No. of Contracts	Frame Building Value.	No. of Building Permits	No. of Contracts	Alterations & Additions Value.	No. of Building Permits	No. of Contracts	Total Value.
Jan'ry....	1	5	$ 64,867	27	37	$ 124,620	19	29	$ 40,016	47	71	$ 229,503

CITY BUILDING NEWS.

Broadway bet. Kearney and Montgomery. Alterations and additions to Garibaldi Hall; owner, Garibaldi Society; day's work; cost $6000.

California and Larkin. Lathing and plastering; owner, Henry Kahn; architect, J. M. Lyon; contractor, A. Flood; signed, Dec. 12; filed, Dec. 14; cost $1100.

California and Jones. Rock and stone apartment building; owner, Nob Hill Improvement Co.; architects, Bugbee & Gash; contractor, S. Gillett; cost one dollar per load.

California and Jones. All molds for artificial sand stone; owners, Nob Hill Improvement Co.; architects, Bugbee & Gash; sub-contractors, Kegan & Manetta; cost $1000.

California and Jones. Hauling rock; owners, Nob Hill Improvement Co.; architects, Bugbee & Gash; contractor, J. J. Norton; cost one dollar and twenty cents per load.

Capp near 17th. To build; owner, A. Eberhart; architect, Emil John; contractor, Emil Huelle; signed, Dec. 13; filed, Dec. 15; cost $4525.

Clipper near Noe. To build; owner, Julie A. Kammer; architect, F. B. Wood; contractor, F. H. Bassett; signed, Dec. 14; filed, Dec. 15; cost $2300.

Clement near 5th Ave. To build; owner, Geo. M. Coon; contractor, A. L. Jacobsen; signed, Dec. 27; filed, Dec. 27; cost $2350.

Davis street. Brick work, etc.; owner, Isaac Kohn; architects, Pissis & Moore; contractor, Liebert & Hoffman; signed, Nov. 12; filed, Nov. 12; cost $5919.

Duncan and Dolores. To build; owner, John J. Comerford; contractor, Wm. Plant; signed, Jan. 7; filed, Jan. 7; cost $1250.

Eighteenth near Sanchez. To build; owner, Peter J. Finley; contractor, G. A. Nagel; signed, Dec. 1; filed, Dec. 13; cost $4500.

Fourth Ave. and California. To build; owner, T. H. Simons; days work; cost $5000.

Fourth and Berry. Sheds &c. holding voting booths; owner, City of San Francisco; contractor, J. M. Weir; cost $4330.

Green and Buchanan. Carpenter and mill work for six frame dwelling; owner, California Title Insurance and Trust Co.; architect, Wm. Mooser; contractor, John Martin; signed, Dec. 29; filed, Jan. 3; cost $4710.

Green and Buchanan. Painting; owner, California Title Insurance Trust Co.; architect, Wm. Mooser; contractor, Joseph Fuchs; signed, Dec. 29; filed, Jan. 3; cost $1000.

Green and Buchanan. Plumbing, etc.; owner, California Title Insurance Trust Co.; architect, Wm. Mooser; contractor, J. P. Culley; signed, Dec. 29; filed, Jan. 3; cost $1930.

Green and Buchanan. Granite curbs, etc.; owner, California Title Insurance Co.; architect, Wm. Mooser; contractors, H. M. Peterson & Co.; signed, Dec. 29; filed, Jan. 3; cost $1000.

Green and Buchanan. Plastering; owner, California Title Insurance Co.; architect, Wm. Mooser; contractor, T. Tucker; signed, Dec. 29; filed, Jan. 3; cost $980.

Guerrero near 23d. Alterations to old church and construction of a new edifice; owner, Trustees of Second Unitarian Church; architect, Samuel Newsom; contractor, John Foster; signed, Dec. 5; filed, Dec. 8; cost $9575.

Haight near Scott. To build; owner, David Sanderson; architect, R. H. White; contractor, John Furness; signed, Dec. 28; filed, Jan. 2; cost $4840.

Hayes near Devisadero. To build; owner, Wm. Macker; architect, Emil John; contractor, J. H. Munster; signed, Jan. 4; filed, Jan 8; cost $4552.

Jackson and Laguna. Plumbing; owner, W. F. Whittier; architect, E. R. Swain; contractor, E. J. Duffey; signed, Dec. 26; filed, Jan. 3; cost $2750.

Lombard and Steiner. To build; owners, architects and builders, Knight & Pottinger; cost $8000.

Lombard near Fillmore. To build; owner, T. W. Rollet; contractors, W. H. Stevens & E. Wood; signed, Dec. 15; filed, Dec. 21; cost $1600.

Lyon near Hayes. To build; owner, Mary E. Liddle; contractor, W. W. Rednall; signed, Dec. 24; filed, Dec. 24; cost $1525.

Market near 5th. Ventilating and heating a brick building; owner, Miss Emma Spreckles; architect, Reid Bros.; contractor, W. W. Montague & Co.; signed, Nov. 20; filed, Dec. 8; cost $11,375.

Market near 5th. Electric light plant; owner, Miss Emma Spreckles; architect, Reid Bros.; contractor, California Electric Works; signed, Nov. 26; filed, Dec. 8; cost $8720.

Market near 5th. Complete ventilating; owner, Miss Emma Spreckles; architect, Reid Bros.; contractor, American Ventilating Co.; signed, Nov. 28; filed, Dec. 8; cost $6600.

Mason near Geary. Excavation and concrete work for a five story brick; owner, Hall Association of the N. S. G. W.; architect, A. C. Lutgens; contractor, Pacific Concrete Co.; signed, Dec. 24; filed, Dec. 26; cost $8220.

Mason near Geary. Steel and iron work; owner, Hall Association N. S. G. W.; architect, A. C. Lutgens; contractor, Western Iron Works; signed, Dec. 26; filed, Dec. 29; cost $9000.

Mason near Geary. Carpenter and mill work; owner, Hall Association of the N. S. G. W.; architect, A. C. Lutgens; contractor, F. A. Williams; signed, Dec. 31; filed, Jan. 8; cost $19,365.

Mason near Geary. Granite work above sidewalk line; owner, Hall Association of the N. S. G. W.; architect, A. C. Lutgens; contractor, J. P. M. Phillips; cost $4650.

Mission near Fourth. Carpenter work of four-story brick; owner, A. W. Wilson; architect, J. R. Miller; contractor, M. J. Gallagher; cost $11,400.

Pacific near Taylor. To build; owner, H. Maskow; architect, Victor Monet; contractors, Mullen & Harrigan; signed, Jan. 3; filed, Jan. 4; cost $2375.

Pine near Kearny. Two-story brick; owner, Loyd Tevis; architects, Kenitzer & Barth; superintendents, Mahoney Bros.; cost $16,000.

Powell near Pine. Removal of old building; owner, August Schiller; architect, Salfield & Kohlberg; contractor, C. B. Smith; signed, Dec. 28; filed, Jan. 5; cost $5425.

Turk near Jones. To build; owner, G. B. Gilman; superintendent, Anderson & Bros.; cost $20,000.

Twenty-second near Castro. To build; owner, T. K. Long; architect, R. H. Daley; contractors, Brutcher & Griffith; signed, Dec. 12; filed, Dec. 17; cost $5,350.

Seventh Ave. near Clement. To build; owner, Sarah F. Mount; contractor, J. Campbell; signed, Dec. 29; filed, Jan. 2; cost $2200.

Sutter near Fillmore. To build; owner, Mary Hinkle; architect, Geo. Hink; days' work; cost $4000.

Van Ness and Geary. Carpenter, mill work, etc.; owner, Mrs. Julia Martin, guardian, etc.; architect, M. J. Lyons; contractor, H. Jacks; signed, Nov. 26; filed, Dec. 10; cost $1186.

Van Ness near Vallejo. To build; owner, H. E. Law; architect, J. B. Mathieson; contractors, Anderson & Gray; signed, Dec. 29; filed, Dec. 27; cost $7515.

Washington and Davis. Brick stone and iron work; owner, Estate of John Ivancovich; architects, Pissis & Moore; contractors, Leibert & Hoffman; signed, Nov. 12; filed, Dec. 21; cost $17,259.

MR. J. M. Carrere, an architect of acknowledged ability, has declined after mature consideration, the position of Supervising Architect of the Treasury Department of the Federal Goverment, which was placed at his disposition.

It is greatly to be regretted that Mr. Carrere could not have brought himself to accept the position. While it would doubtless have involved personal sacrifices on his part, yet the interests of the public and the advancement of Architecture would have received more earnest consideration than can be hoped for now for years to come.

Following is Mr. Carrere's letter:—

JANUARY 28, 1895.

SIR:—As promised to you in our interview at the Treasury Department on January 24th, I have been carefully considering the possibility of accepting the position of Supervising Architect, understanding that you are willing to offer the appointment to me on the terms of my letters and memorandum to you and to Mr. Price and my several interviews with you and Mr. Curtis.

Having had the question of public architecture at heart for several years, and having devoted much of my time to promoting the interests of the "McKaig Bill," when called upon by a large number of leading men in my profession to accept this office, and also understanding that your department was willing to tender the office to me at their request, though I was in no sense an applicant, I felt obliged, as a matter of duty to my profession, laying aside all questions of personal sacrifice, to take the subject under consideration.

I have had every opportunity, owing to your courtesy, to fully investigate the office, and I have been trying for the last two weeks to convince myself that under certain conditions which I asked for, and which I understand you are prepared to grant, I might accept the office with a fair chance of accomplishing the purpose which both you and the profession have in mind, namely, to raise the artistic standard of our public architecture.

In my anxiety to respond promptly and fully to the confidence which has been placed in me, I have at times thought that the task might at least be attempted, and have stood ready to accept the office. After further reflection, and after having fully explained the situation to several leading architects of the country and after consultation with them, I am now convinced that if I should accept the office, and meet even with partial success, I would be defeating the true object which both the profession and yourself have in

view. To our minds, the undertaking is a physical impossibility and must fail.

It is therefore with the greatest regret, and a true appreciation of the efforts which you have personally made to help this branch of the service, that I find myself compelled to advise you that I will not be able to accept the office if tendered to me. In explanation: The work of this department, irrespective of its present organization, or of any improvement that could be made in the same, comprises a staff of about 150 employees, their duties comprising:

1st.—A legal department having charge of all contracts, purchases of sites, deeds, interpretation of laws, classification of the same, and other legal matters relating specifically to this department.

2d.—An extensive system of accounting, burdened by the vast number of small accounts, resulting from the maintenance and repairs of buildings, and needing a very great amount of detail.

3d.—The technical, or draughting division, in which all computations of quantities and cost of work are made: auditing of all accounts; all original designs and working drawings; specifications and calculations comprising both the artistic and practical work, and involving sanitary heating, elevator, lighting, ventilating, and other plants of a purely technical nature; also the superintendence, supervision, and inspection of all these works. The work itself is scattered over the entire United States, and is absolutely beyond the reach of any one man except by proxy, and practically beyond his control.

The number of buildings now in the course of construction, some of them well advanced, others hardly started, and many of them still untouched, is 115, ranging from the Marine Hospitals, the appropriation for which is only about $2000, but involving much troublesome detail and waste of time, up to buildings like the San Francisco Post Office, the appropriation for which is about $2,000,000; Buffalo Post Office, about $1,500,000; Kansas City Post Office, about $1,000,000; the New York Appraiser's stores, $2,000,000; these being the most important buildings, the others ranging all the way from $500,000 to $50,000 and under. In addition to this, eight buildings are now about to be appropriated for, ranging from $100,000 up to $4,000,000 for the Chicago Post Office, the latter to be constructed within a period which I understand is not to exceed two years.

In addition to the above, Congress appropriates about two hundred thousand dollars a year for the maintenance of over two hundred and fifty buildings; most of this money is spent in small amounts, ranging from fifty cents upwards, for repairs, etc., involving infinite trouble and drudgery, and demanding much time and attention.

The present condition of this work is in such a disorganized state that it would take the best part of any man's time to reorganize the work itself, irrespective of the department. The accumulated waste of money is beyond belief. The department, in the main, seems to be well organized, though cumbersome. The personnel is efficient in a measure, but ill adapted to the class of work which the country expects of our Government, and absolutely deficient in artistic worth. The tenure of the office is controlled either by civil service rules or by political influence, and with this state of affairs the office of Supervising Architect, legally, is merely that of clerk of the department appointed by the Secretary of the Treasury, and though his responsibility is supposed to cover all the above work, his authority is absolutely dependent on the Secretary of the Treasury, and much of it is divided with heads of departments.

Any man, no matter what his ability or his power for work and concentration, and no matter what conditions might be offered to him, even those of absolute responsibility with absolute authority, would have to devote himself either to managing the office, allowing the designing to be done by draughtsmen, as at present, or to designing, allowing the office to be managed by heads of departments, as at present; and no man of ability, with a reputation to lose as an artist, would be presumptuous enough to accept the office, even if his duties were to be confined to designing, irrespective of any other work or responsibility, because it is absolutely beyond the grasp, and the ability of any one man who has ever lived to imprint his personality upon this work, and much less to design it and study it himself.

The time must come, and I believe has come, when this work should be divided and intrusted to the best architects in this country, as suggested by the bill proposed by the architects and known as the "McKaig Bill," leaving the administrative portion of the work only in the hands of the Government, where it belongs. My examination of the office and its possibilities convinces me that the underlying principle upon which it is based is radically wrong, and that it is beyond the power of any one man to make a success of it. The system, not the man, should be changed.

Yours respectfully,

JOHN M. CARRERE.

To Hon. J. G. Carlisle, Secretary of Treasury, Washington, D. C.

IN view of the fact that there is now a bill for the licensing of Architects before the Legislature would it not be well for the Chapters of the American Institute of Architects to inaugurate a series of voluntary examinations after the same manner as the British Architects did many years ago; after much patience and perseverance they have finally got these examinations so well established throughout the Kingdom that a successful passing thereof is now necessary before a Candidate is eligible to the R. I. B. A. By this means a standard of excellence is attained that will make a member of that body respected wherever these facts are known, and such a method as this is the only way to raise the profession here from its present, one might call it, degraded state.

When once the public knows that to be able to put A. I. A. after ones name means that the person carrying it has had to give evidence of technical and general education before he can do so, it will with a better grace trust itself to such, and it would help to make many members of the profession who now stand aloof willing to join such an organization.

On another page will be found a History of the Architectural Examining System of Great Britain.

LIGHTING OF SCHOOL ROOMS.

THE proper lighting of school rooms being one of the most important matters in the planning of School Houses the Board of Education of Alameda have examined into the eyesight of the school children—and the following extract from the *Alameda Encinal* gives the result of the experts report:

"The Board of Education held its regular meeting last evening. All the members were present, and after the reading and approval of the minutes of the previous meeting, Dr. P. M. Jones, the occulist, made a report of the result of the examination of the eyes of some 1367 pupils in our public schools.

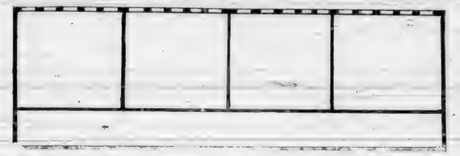
The report was exceedingly interesting, as well as instructive. In the High School he had found 22 per cent of the pupils affected with near sightedness, and 30 per cent. with conjuncturitis, or inflammation of the eye. In the Haight School 15 per cent near sighted and 17 inflammation; Encinal School, 8 near sighted and 35 inflamation; Wilson School, 3 near-sighted and 29 inflammation.

In the Porter School he found a startling condition. He stated that 52 per cent of inflammation was found and 5 per cent of near-sightedness. The inflammation here, he stated, was 20 per cent higher than it should be, and was occasioned by reason of the poor light. He reported that the per cent of strained eyes in this school is also large.

"The matter of light should be fully appreciated in the construction of the new West End School," said the Doctor. "Windows placed only a foot from the ceiling will give 25 per cent better lighting capacity than the ordinary location." As to shades, he recommended opaque shades in preference to blinds. On the whole, however, he admitted that the condition of the eyes of our pupils, outside the Porter School, was better than in many other cities."

It is gratifying to see from this report that the latest building erected the "Wilson" School has the least percentage of bad eyes—and the one erected a little before it the "Encinal" comes close to it, while the oldest school houses, the High and the Porter Schools have by far the largest percentage of bad eyes.

This indicates what a vast stride has been made in School Architecture within the last fifteen years. No doubt still better results may be obtained, but as far as these experiments show—a plan based on that of the latest buildings put up in Alameda is the best for the eyes of the children.



The rooms in the Wilson School face the NW while the ones in the Encinal School face SW which, as both houses are built on practically the same plan, seems to indicate that a northern light is best for the eyes.

The windows used for light are all placed on one side of the room—which should be the largest—and the windows are equally spaced on that side and it should be one of the injunctions placed upon school architects that no consideration of outside grouping should interfere with this arrangement so good for distributing the light equally throughout the apartment.

The points in regard to lighting then are:

FIRST.—Room to be lighted from one side.

SECOND.—That side to be the largest, or in other words, the further side of the room is to be kept within proper lighting distance of the window side.

THIRD.—North light.

FOURTH.—Windows kept as near as possible to ceiling and high up from floor so that the light may reach better the opposite side of room.

FIFTH.—Windows equally spaced.

W. J. CUTHBERTSON.

REPORT OF THE COMMITTEE APPOINTED TO COLLECT DATA OF AUTHENTICATED TESTS ON WASHINGTON BUILDING MATERIALS.

To the Hon. President and Members of the Washington State Chapter of the A. I. A.

GENTLEMEN:—Your Committee respectfully presents the following report, and begs to call the attention of the Chapter to the fact that, in so important a matter as that in hand, being in fact the very foundation from which the Architect and Engineer work, the time has been much too short to give anything but a meagre report, and one which in the estimation of your Committee, must fall far below the requirements.

For information in regard to Washington stone, the Committee have to gratefully acknowledge the courtesy of Colonel Prindle, now Chief Engineer at the Brooklyn Navy Yard, and recently Chief at the Port Orchard Dry Dock, also Mr. H. L. Copeland, Architect in charge of the State Capitol Building at Olympia. For information in regard to clay building materials and lumber, the same acknowledgments are due to Mr. Thomson, C. E., City Engineer of Seattle, Mr. C. B. Talbot, C. E. of Tacoma, a member of the Chapter, The Puget Sound Lumberman, and the Denny Clay Company.

STONE.

Under the above heading your Committee finds that all kinds of stones under the scientific classifications as Siliceous, Argillaceous and Calcareous are found in vast abundance in the State of Washington. We regret to have to report, however, notwithstanding the amount of building that has been done, that for the most part the so-called quarries from which stone is supplied, are little better than undeveloped facings from which stone has been taken only in the crudest way by blasting; a system to be condemned, being injurious to good building stone in that it shakes it, besides causing considerable waste. Exception to these remarks may be made as to the Tenino Stone Quarry.

For the most part the building stones so far used in Western Washington are of the Siliceous order. We herewith submit the record of tests we have gathered, made for the most part by the U. S. Government at the Watertown arsenal:—

ORDANCE DEPARTMENT, U. S. A. REPORT OF MECHANICAL TESTS MADE WITH THE U. S. TESTING MACHINE, CAPACITY 800,000 POUNDS, AT WATERTOWN ARSENAL, MASS., JULY 7th, 1894. FOR HENRY ROEDER, CHUCKANUT, WASH.

Tests by Compression.—Bellingham Bay Stone, from Chuckanut Quarries.

Compressed surfaces faced with plaster of Paris to secure even bearings in the testing machine.

Test No.	Dimensions Height Inches	Compressed Surface Inches	Sectional Area Sq. Inches	First Crack Lbs.	Ultimate Strength Total Lbs.	Per Sq. In. Lbs.
7178	3.99	4.22	4.20	17.52	179,000	182,100	10,276
7179	4.09	4.18	4.20	17.35	183,000	224,960	12,700
7180	4.20	4.21	4.23	17.81	192,000	197,700	11,100

Correct:

J. E. HOWARD.

J. W. REILLY,
Major Ord. Dept. U. S. A.
Commanding.

THE VULCAN IRON WORKS.

SEATTLE, WASH., Nov. 5, 1894.

Northern Construction Co., Tacoma, Wash.

GENTLEMEN:—We have this day tested three pieces of stone for you with the following results:—

Piece of White Sunset,	2⅛x2⅛x4,	Ultimate Resistance,	5801 lbs.	per sq. inch.
" Buff	1⅞x1⅞x4,	"	7199	" "
" Pittsburg,	2⅛x2⅛x4,	"	5886	" "

Yours very truly,

THE VULCAN IRON WORKS CO.,
Per J. Hulme,
Manager.

Test No. 7175, made by the U. S. testing machine at Watertown Arsenal, Mass., July 6, 1894, on Olympia sand-

stone from the Olympia Sandstone Quarry crushed at 13,441 lbs. per sq. inch.

COMPRESSION TESTS OF VARIOUS ROCKS. MARCH 30, 1890.

Nos. 1 and 2.—Vanc. Granite Quarries (Dog Fish Point Sandstone Quarry) Light Grey. Show no sign of cracking at 5000 lbs. per sq. inch.

Nos. 3 and 4.—New Castle Island Stone. Light Grey. No. 3 cracked at 4800 lbs. per sq. inch. No. 4 cracked at 4750 lbs. per sq. inch.

Nos. 5 and 6.—Bellingham Bay. Blue. Show no signs of cracking at 5000 lbs. per sq. inch.

Nos. 7 and 8.—Eureka Sandstone Quarry. Blue. No. 7 shows no sign of cracking at 5000 lbs per sq. inch. No. 8 cracked at 4985 lbs. per sq. inch.

Nos. 9 and 10.—Wilkson Stone. Light Grey. No. 9 shows no sign of cracking at 5000 lbs. per sq. inch. No. 10 cracked at 4975 lbs. per sq. inch.

Nos. 11 and 12.—Tenino Blue. No. 11 cracked at 3025 lbs. crushed at 3855 lbs. per sq. inch. No. 12 cracked at 2990 lbs. crushed at 3475 lbs. per sq. inch.

Nos. 13 and 14.—Tenino Buff. No. 13 cracked at 3010 lbs. crushed at 3525 lbs. per sq. inch. No. 14 cracked at 3275 lbs. crushed at 3875 lbs. per sq. inch.

Tests made with cubes of 1 inch square, testing machine only works to 5000 lbs. pressure, therefore crushing not shown except where it fell below that amount.

H. L. COPELAND,
Representing Ernest Flagg, Architect,
State Capitol Bldg., Olympia, Wash.

PUGET SOUND NAVAL STATION, PORT ORCHARD, WASH., NOV. 29, 1894.

GENTLEMEN:—Answering your inquiry of 9th inst., as to what tests, if any, have been made by the Government authorities, of materials found in the State of Washington, in connection with the work in progress here, etc., I beg to state that, so far as I am informed, only some analyses of Tenino Sand Stone have been made, by Medical Director Wales, U. S. N., in charge of the Museum of Hygiene, at Washington, D. C., with the following results:

	No. 1.	No. 2.
Silica,	96.70 per cent	87.30 per cent.
Alumina,	.88	1.24
Iron Oxides,	.87	1.20
Lime,	1.24	8.02
Undetermined,	.82	1.04
Specific Gravity,	2.49	2.50

Both samples are of blue-gray color, and the cementing material is chiefly calcium carbonate. The hardness of No. 2 is greater than that of No. 1, and altogether I consider No. 2 the more suitable for building purposes.

Constant action of the sea water will in time tend to dissolve the cementing material and allow the stone to crumble.

Very respectfully,

F. C. PRINDLE,
Civil Engineer, U. S. N.

To CHARLES W. SAUNDERS and CHARLES H. BEBB, Committee on Tests of Washington Bldg. Materials. Bailey Building, Seattle, Wash.

Of the Granites by far the largest quantity so far used in this part of the State has been supplied from the Nelson Is. B. C. quarry. We understand that a granite quarry has been opened at Index on the Great Northern R. R. While the quality of this granite appears good as far as your Committee knows, it has not been officially tested.

It has become very evident to your Committee after the necessarily limited investigation into the subject of stone that the known data is entirely inadequate. The necessity of reliable official tests being of such importance, your Committee would respectfully advise that a new Committee, representing in themselves the Eastern, as well as the Western sections of this State, be appointed. That they prepared a blank form of required tests which should comprise, crushing strength, specific gravity, absorbtion and a simple acid test for weathering qualities; that such form be sent by them to each and every working quarry in the State, with a request that each quarry have their stone tested by some well known authority, preferably by the U. S. Government at the Watertown Arsenal, and the result filled in the form furnished, and returned to the Secretary of the Chapter. We believe that every quarry-owner will gladly embrace the opportunity to place such information in the hands of the Engineers and Architects of this State from purely business motives, and thus afford the means of giving Washington Stone a standard reputation.

In conclusion under the heading of Stone, your Committee would suggest that the following resolution be submitted to the Chapter:

RESOLVED:—That the Washington State Chapter of the A. I. A. now convened at its first annual meeting express it as their opinion that the use for building purposes of freshly quarried stone, unseasoned and full of moisture or quarry sap is detrimental alike to the best interests of the building, the quarry and the Architect.

RESOLVED.—That the members of the Washington Chapter

will give the preference as far as in their power lies for stone which has been duly quarried and seasoned, and that they will do all in their power to encourage the system of using quarried stone only.

To Be Continued.

THE EXAMINATION FOR ADMISSION TO CANDIDATURE: AN HISTORICAL NOTE.

WITH the new Year of Grace the system of Progressive Examination for admission to candidature as Associate has come into full force. Every aspirant for such position must henceforth qualify for registration (1) as Probationer, (2) as Student, and (3) as Candidate for Associateship; and this can only be done by passing three distinct examinations or tests of competency. There are still more than one hundred men, relegated to their studies from previous examinations, who have the right of admission after passing the single Qualifying (now the "final") Examination. It is still possible, in the case of architects in practice and chief assistants, to apply for exemption from qualifying as Probationer and Student; and the privilege will endure for a time. But, for the youth of the profession, admission to candidature as Associate is now only obtainable after satisfying the Council of the Institute in the Preliminary, Intermediate, and Final stages, respectively, of the Examination in Architecture.

As more than a generation has come and gone while the events leading to this result have matured, it may be useful, and perhaps not uninteresting, especially at the present time, to recall the more prominent of them.

Some forty years ago a French architect printed an Essay, a copy of which he presented, entitled *Du Diplome d'Architecte*. He discussed the state of the question at that time, the compatibility of a diploma with the profession of architect, what should be the character of the diploma, and how it should be established. A Paper on this subject, which was to a great extent an abstract of Lance's Essay, was prepared by the late J. Woody Papworth and read before the Institute on the 19th of November, 1855. The discussion which followed, and the lively interest taken in it by *The Builder*, then conducted by the late George Godwin, at that time a member of the Institute Council, caused a slight flutter among the chiefs of the profession; and the discussion was resumed at a General Meeting held 3d December, 1855, when a Vice-President, the late Sir William Tite, who occupied the Chair, opened the proceedings by stating that the Council had received a Memorial from the Architectural Association (London) in favour of a professional examination and diploma.

The text of this memorial, which was signed by the President of the Association, the late Alfred Bailey, and the two Hon. Secretaries, is as follows:—

Your memorialists, representing the younger members of the architectural profession, beg to lay before the Royal Institute of British Architects their desire for the establishment of an Examination, which may eventually serve as the basis for the issue of such a diploma as shall certify that the holder thereof is fully qualified to practice as an architect.

They have been induced to take this step from the consideration of the difficulties which, in the present day, beset the early stages of architectural education.

In preparation for entrance upon their articles, in studies during the period of their sojourn in an office, and in the critical interval from the completion of their articles to the moment of commencing practice, the students of architecture are without sufficient guidance. In no case have they that important and valuable direction given to their several studies which is found to be so successful an inducement to the complete mastery of other professions; and this evil produces its more important effects when students of architecture, having completed their articles, commence practice on their own responsibility.

The want of proper knowledge on the part of the architect, combined as it is with a want of information on the part of the public, leads to many of the anomalies which are now so frequently observable in the practice of the profession, and to the presence in its ranks of many who have not the power, and in some cases of those who have not the will, to uphold its credit.

So much attention has been lately turned towards the necessity of testing by examination the competency of all candidates for public employment, that your memorialists are led to submit that the present is a highly opportune period for bringing the subject under your consideration. They feel that they are addressing those who represent the architectural profession, and by whom only an authoritative step towards the establishment of an Examination, or the granting of a Diploma, could be taken. They are also assured that the senior members of the profession could hardly take the initiative till the necessity for that course had been brought before them by those who have more recently entered the profession.

Your memorialists do not feel themselves called upon to enter into further details, because they are convinced that the members of the Institute must, from their position, be fully cognisant of the evil results of the present system; and, therefore, do not doubt that the Council will take an early opportunity of organising an Examination such as shall be found best calculated to aid and direct the student, and to bring the real qualifications of the architect before the public.

On the 14th January, 1861, at a Special General Meeting of the Institute, when a Vice-President, Mr. (afterwards Sir) M. Digby Wyatt, occupied the Chair, it was announced that the Council, having communicated with several non-Metropolitan Societies, and with the Architectural Association (London) on the subject of an Examination, had received replies generally to the effect that it was desirable to afford an opportunity for a voluntary professional examination. In the discussion which ensued a motion, proposed by the late J. W. Papworth and seconded by Professor Kerr [*F.*] was put and carried, as follows:—"That this Institute, by the publication of the Resolution* of the 25th June, 1860, and by the circulation of the propositions submitted by the Council at that time, having, to the utmost of its power, ascertained the views of the profession thereon, and having taken into consideration the replies forwarded by the various Societies, does, in conformity with the wishes expressed in these communications, take upon itself the labour of constituting an Examination tending to promote a systematic professional education." After further discussion, in which the late George Edmund Street took part, Professor Kerr moved, and the late William Burges seconded, "That the Council be instructed to proceed with the preparation of a Curriculum and By-Laws, and be recommended to appoint a Committee to this end, and to report to a General Meeting."

In May 1862 was published a paper of *Regulations and Course of Examination, with Forms of Declaration and Recommendation, for the Voluntary Architectural Examination*, which was divided into two classes—a "Class of Proficiency" and a "Class of Distinction;" and applicants for admission to either class were required to submit "Preliminary work." In January 1863 nineteen persons applied to be exained inm the class of Proficiency and two in that of Distinction. Fourteen were admitted, the preliminary work of four being

* The words of the Resolution unanimously passed at the General Meeting of 25th June 1860 were "That it is desirable to afford an opportunity for a voluntary professional examination."

deemed insufficient, to the 'Proficiency Class. The late Arthur Ashpitel, the late Sir G. G. Scott, and the late Sir Digby Wyatt were appointed Examiners; the late J. W. Papworth and Professor T. Roger Smith [*F.*], then an Associate, were appointed Moderators. Out of the fourteen applicants, eight passed. The Examiners' Report concluded with congratulations to the Council "upon the healthy stimulant to study which, we cannot but feel, must attend upon exertions made in the spirit displayed by the candidates for examination on this highly auspicious first trial of a system likely to produce hereafter, we fully believe, considerable benefits to the profession."

In 1864 eighteen persons applied. Thirteen were admitted to the class of Proficiency, and seven passed; two were admitted to the class of Distinction and passed. The Examiners were Ashpitel, Scott and Professor T. Hayter Lewis [*F.*]; the Moderators, J. W. Papworth and Mr. Charles Fowler [*F.*].

In 1865 there were only four applications, and no examination was held. In 1866 there were six applicants, and four were admitted to the class of Proficiency, all of whom passed. In 1867 no examination was held, only four persons having applied. In 1868 there was one application and no examination was held. In 1870 there were nine applicants for admission to the class of Proficiency, of whom seven were admitted and four passed. In this year was held the first of the Preliminary Examinations established by Resolution on the 21st June 1869, with the proviso that the passing of them was not compulsory on those who came up for the classes of Proficiency and Distinction in the Voluntary Architectural Examination. In 1872 there was one application to be admitted to the class of Proficiency. In 1873, after the programme of the Examination had been divided into artistic and scientific sections, there were five applicants, three of whom passed in both sections, and one in Art only, another in Science only. In 1875 there were six applicants, two of whom passed.

In 1880 twenty persons, some of whom had passed in one or other section of the Examination, presented themselves in the class of Proficiency, and six passed. In June 1881 was held the last Voluntary Architectural Examination, when four persons were examined and passed.

In the course of nineteen years there had been held ten examinations in the class of Proficiency, and forty-three persons had passed, three of them having also passed the class of Distinction. The passed candidates in the Preliminary class (1870–79) numbered 47; and two of these received the Ashpitel Prize: Mr. J. F. Hennessy in 1875, and Mr. John Bilson [*F.*] in 1877.

That in the course of nineteen years, from 1863 to 1881, both inclusive, not more than a hundred persons thought it worth while to apply for admission to the class of Proficiency in the Voluntary Architectural Examination, that only five students per annum could be induced to enter for this examination, less than half of whom were proved competent to pass it, was discouraging. Apart, however, from examinations, the seventies were not years of prosperity to the Institute, and it is not extraordinary that more than one special committee should have met to consider its affairs and its general improvement as a working professional body. In 1877 the Past-Presidents and Past Vice-Presidents were invited by the general body to assist the Council, to use the late John Whitchord's words, "Not so much in improving the method of our work, as in arousing a spirit of earnest energy within our ranks." It was then that the By-Laws made under the Original Charter were revised with considerable care and acumen; and there was passed a new By-Law,* to the effect that, after May, 1882, no person should be admitted to candidature as Associate without first passing an examination. Mr. Charles Barry [*F.*] was then President, and to him succeeded the late John Whichcord, whose two years of office must always be regarded as having been of vital importance to the interests of the Institute regarded as the representative body of the profession, and to those of the Examination which was to come into effect in 1882. Whichcord, who became President in 1879, took the Chair at all the meetings—the first of which was held 4th July 1879—of the Special Committee for Examinations, whose Report, prepared by Mr. J. Douglass Mathews [*F.*] and Mr. H. L. Florence [*F.*], was passed in February 1880. To them succeeded the "Architectural Examinations Committee," whose first meeting took place 3d June 1880, when Mr. Arthur Cates [*F.*] was appointed Chairman and Mr. R. Phene Spiers [*F.*] Hon. Secretary. Their report was brought up at the seventh meeting; and at the eight the scheme of Examination under By-Law XIV. was passed. Their report contained the Regulations, Programme, Forms of Application, etc., in the new Examination, which were approved by the Institute on the 6th January 1881, after the Meeting had made a remarkable alteration in the Examination Programme. The Committee appointed the year before to work out the scheme, the heads of which were incorporated in the Council Report of 1880 and approved by the Institute, had not ventured to include in their programme a complete test of architectonic aptitude. They had omitted all attempt to fully examine in "Design." The Committee had recommended, and the Council had approved, that two hours and a half of one of the three days given to the Written and Graphic Examination should be devoted by the examinees to making "the plan of a building with the details of arrangement for a selected purpose, adapted to a particular site"—the outline of the said site and a statement of requirements to be prepared for the guidance of the examinees. The Institute approved this with the proviso that the words "section and elevation" should be inserted after the word "plan."

To be continued.

* This was By-Law XIV., which was thus worded:—All gentlemen engaged in the study or practice of civil architecture, before presenting themselves for election as Associates, shall, after May 1882, be required to pass an examination before their election, according to a standard to be fixed from time to time by the Council.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 108 California street
SETH BABSON, Pres. GEO W. PERCY, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
OCTAVIUS MORGAN, Pres. A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec't. AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

SOUTHERN CALIFORNIA CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE regular semi-annual meeting of the Southern California Chapter of the American Institute of Architects, was held Wednesday evening, February 6, 1895.

The Treasurer's report was read and showed the finances to be in good condition; other reports are to be submitted at the semi-annual banquet to be given shortly. The report of the committee to act in regard to the Legislative Bill to regulate the practice of architecture in the State was given, and the same committee, Messrs. Morgan, Preston and Benton was authorized to send another delegation to the Capitol if in their judgment such action was necessary.

The report of the special committee on banquet was received, and the committee continued.

The semi-annual election of officers resulted in the re-election of Octavius Morgan to his fourth term as President, and the re-election of Messrs. Edelman and Wackerbarth, Vice-President and Treasurer respectively. The Secretary and Corresponding Secretary are elected at the annual meeting in August.

The new board of directors are Messrs. Morgan, Edelman, Benton, Wackerbarth, Aiken, Burton, Preston and Walls.

BUILDERS' CONTRACT OF THE BUILDERS' EXCHANGE OF SAN FRANCISCO, CALIFORNIA.

ARTICLES OF AGREEMENT.

MADE this——day of——one thousand eight hundred and———between———of the———County of——, State of California, the part of the first part, and——— of the——County of———, State of California, the part of the second part.

WITNESSETH:—The part of the first part will be hereinafter designated as the Owner, and the part of the second part as the Contractor, singular number only being used; and the word Architect used herein in the singular shall include the plural, and the masculine the feminine.

FIRST.—The Contractor agrees, within the space of——working days from and after———to furnish the necessary labor and materials, including tools, implements and appliances, required, and perform and complete in a workmanlike manner all the———and other works shown and described in and by, and in conformity with the plans, drawings and specifications for the same made by———the authorized Architect employed by the Owner, and which are signed by the parties hereto.———

SECOND.—Said Architect shall provide and furnish to the Contractor all details and working drawings necessary to properly delineate said plans and specifications; and the work is to be done and the materials furnished in accordance therewith under the direction and supervision and subject to the approval of said Architect, or a superintendent selected and agreed upon by the parties hereto, within a fair and equitable construction of the true intent and meaning of said plans and specifications.

THIRD.—The time during which the Contractor is delayed in said work by the acts or neglects of the Owner or his employees, or those under him by contract or otherwise, or by the acts of God which the Contractor could not have reasonably foreseen and provided for, or by stormy and inclement weather which delays the work, or by any strikes or like trouble among mechanics or laborers which delay said work and which are not caused by, or the continuance of which is not due to any unreasonable acts or conduct on the part of the Contractor, shall be added to the time for completion as aforesaid.

FOURTH.—Said building———to be erected upon a lot of land situated in———County of———, State of California, and described as follows:—

FIFTH.—The Owner agrees, in consideration of the performance of this agreement by the Contractor, to pay, or cause to be paid, to the Contractor, his legal representatives or assigns, the sum of———dollars in United States Gold Coin, at the times and in the manner following, to wit:—

PROVIDED, that when each payment or installment shall become due, and at the final completion of the work, certificates in writing shall be obtained from the said Architect, stating that the payment or installment is due or work completed, as the case may be, and the amount then due; and the said Architect shall at said times deliver said certificates under his hand to the Contractor, or, in lieu of such certificates, shall deliver to the Contractor, in writing, under his hand, a just and true reason for not issuing the certificates including a statement of the defects, if any, to be remedied, to entitle the Contractor to the certificate or certificates. And, in the event of the failure of the Architect to furnish and deliver said certificates, or any of them, or in lieu thereof the writing aforesaid, within three days after the times aforesaid, and after demand therefor made in writing by the Contractor, the amount which may be claimed to be due by the Contractor, and stated in the said demand made by him for the certificate, shall, at the expiration of said three days, become due and payable, and the Owner shall be liable and bound to pay the same on demand.

In case the Architect delivers the writing aforesaid in lieu of the certificate, than a compliance by the Contractor with the requirements of said writing shall entitle the Contractor to the certificate.

SIXTH.—For any delay on the part of the Owner in making any of the payments or installments provided for in this contract after they shall become due and payable, he shall be liable to the Contractor for any and all damages which the latter may suffer; and such delay shall, in addition, operate as an additional extension of the time for completion aforesaid for the length of time of such delay. And such delay, if for more than five days after the date when said payments or installments shall have respectfully become due and payable, as in this agreement provided, shall, at the option of the Con-

tractor, be held to be prevention by the Owner of performance of this contract by the Contractor.

Seventh.—The specifications and drawings are intended to co-operate, so that any work exhibited in the drawings and not mentioned in the specifications, or *vice versa*, are to be executed the same as if both mentioned in the specifications and set forth in the drawings, to the true intent and meaning of the said drawings and specifications when taken together. But no part of said specifications that is in conflict with any portion of this agreement, or that is not actually descriptive of the work to be done thereunder, or of the manner in which the said work is to be executed, shall be considered as any part of this agreement, but shall be utterly null and void.

Eight.—Should the Owner or the Architect, at any time during the progress of the work, request any alterations or deviations in, additions to, or omissions from, this contract or the plans or specifications, either of them shall be at liberty to do so, and the same shall in no way affect or make void this contract: but the amount thereof shall be added to, or deducted from, the amount of the contract price aforesaid, as the case may be, by a fair and reasonable valuation. And this contract shall be held to be completed when the work is finished in accordance with the original plans, as amended by such changes, whatever may be the nature or extent thereof.

Ninth.—The rule of practice to be observed in the fulfillment of the last foregoing paragraph (eight) shall be that, upon the demand of either the Contractor, Owner or Architect, the character and valuation of any or all changes, omissions, or extra work, shall be agreed upon and fixed in writing, signed by the Owner or Architect and the Contractor, prior to execution.

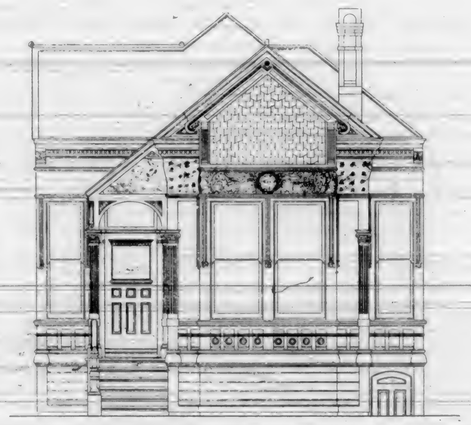
Tenth.—Should any dispute arise between the Owner and Contractor, or between the Contractor and Architect, respecting the true construction of the drawings or specifications, the same shall, in the first instance, be decided by the Architect: but should either of the parties hereto be dissatisfied with the justice of such decision, or should any dispute arise between the parties hereto respecting the valuation of the extra work, work done, or work omitted, the disputed matter shall be referred to, and decided by, two competent persons who are experts in the business of building,—one to be selected by the Owner or Architect, and the other by the Contractor; and in case they cannot agree, these two shall select an umpire, and the decision of any two of them shall be binding on all parties.

Eleventh.—Should the Contractor fail to complete this contract, and the works provided for therein, within the time fixed for such completion, due allowance being made for the contingencies provided for herein, he shall become liable to the Owner for all loss and damages which the latter may suffer on accounnt thereof, but not to exceed the sum of $——per day for each day said works shall remain uncompleted beyond such time for completion.

Twelfth.—In case said work herein provided for, should, before completion, be wholly destroyed by fire, defective soil, earthquake or other act of God which the Contractor could not have reasonably foreseen and provided for, then the loss occasioned thereby shall be sustained by the Owner to the extent that he has paid installments thereon, or that may be due under the fifth clause of this contract; and the loss occasioned thereby and to be sustained by the Contractor, shall be for the uncompleted portion of said work upon which he may be engaged at the time of the loss, and for which no payment is yet due under said fifth clause of this contract.

In the event of a partial destruction of said work by any of the causes above named, then the loss to be sustained by the Owner shall be in the proportion that the amounts of installments paid or due bears to the total amount of work done and materials furnished, estimated according to said contract price, and the balance of said loss to be sustained by the Contractor.

Thirteenth.—The payment of the progress-payments by the Owner, shall not be construed as an absolute acceptance of the work done up to the time of such payments; but the entire work is to be subject to the inspection and approval of the Architect or Superintendent at the time when it shall be claimed by the Contractor that the contract and works are completed; but the Architect or Superintendent shall exercise all reasonable diligence in the discovery, and report to the Contractor as the work progresses, of materials and



FRONT ELEVATION.

labor which are not satisfactory to the Architect or Superintendent, so as to avoid unnecessary trouble and cost to the Contractor in making good defective parts.

Fourteenth.—Should the Contractor at any time during the progress of the work, refuse or neglect, without the fault of the Owner, Architect or Superintendent, to supply sufficiency of materials or workmen to complete the contract within the time limited herein, or any lawful extension thereof, for a period of more than three days after having been notified by the Owner in writing to furnish the same, the Owner shall have power to furnish and provide said materials or workmen to finish the said work; and the reasonable expenses thereof shall be deducted from the amount of the contract price.

In Witness Whereof, the said parties to these presents have hereunto set their hands and seals, the day and year first above written.

FLOOR PLAN

BOOKS AND PERIODICALS.

SAN FRANCISCO MUNICIPAL REPORTS for the fiscal year 1893–1894 ending June 30, 1894, published by order of the Board of Supervisors of San Francisco. In addition to the official reports this volume contains two pages of illustrations, the portrait of Mayor L. R. Ellert, as well as those of the twelve Supervisors from M. Goodwin of the First ward to James Denman of the Twelfth.

The always welcome ANNUAL REPORT OF THE BOARD OF REGENTS of the Smithsonian Institution, showing the operations, expenditures and condition of the Institution to July, 1893. Our space will not admit of a mention of all the interesting reports contained in this volume; among others that attracted our attention was an article entitled "North American Bows, Arrows and Quivers," by Otis Tufton Mason, fully illustrated, also "Deep-Sea Deposits" by A. Daubree being a review of work of the Challenger Expedition translated from *Journal des Savants*; "How Maps are Made" by W. B. Blakie, cannot fail to interest our geographical friends as well as the public in general; "The Age of the Earth" by Clarence King, but enough, the work must be carefully studied to appreciate its merits.

THE PHOTOGRAPHIC TIMES. An illustrated monthly Magazine devoted to the interests of artistic and scientific photography—published at 423 Broome street, New York.

In changing from a weekly journal to a monthly magazine we should judge by the first number that the publishers had made a very successful departure and are certainly to be congratulated for having produced such a beautiful magazine; many of the illustrations are little gems of art.

The amature photographer as well as the professional are under a debt of gratitude to the editor and publishers of this truly beautiful as well as useful publication, and should pay the debt by becoming subscribers.

FINAL REPORT OF THE CALIFORNIA WORLD'S FAIR COMMISSION, including a description of all Exhibits from the State of California, collected and maintained under Legislative enactments at the World's Columbian Exposition, Chicago, 1893. The Fair Commissioners are to be congratulated upon having given to the public such a handsome volume and with closing their labors in such a creditable manner. In a letter to Gov. H. H. Markham transmitting their report, we notice the following, that certainly is very creditable to our State, with the single exception of that of Illinois, the California building was the largest State building on the Exposition grounds. While maintaining a distinct exhibit in nearly all of the departments or national buildings, such as the Horticultural, Mining, Agricultural and Forestry, the State displayed in her own building so extensive an aggregation of her own products that it was often referred to collectively as "California in miniature," and as an "Exposition in itself."

The illustrations are good and convey a very convincing idea of what California did to represent herself at the World's Columbian Exposition.

WHAT IS NEEDED TO COMPLETE THE CITY HALL.

FROM a report by Architect Shea we take the following detailed statement of the work that will have to be done to complete the New City Hall:

FIRST.—A permanent fire-proof roof, covering the entire building with the exception of the Hall of Records.

SECOND.—The carrying up of all the main interior walls to a proper height, a satisfactory system of ventilation introduced and all smoke-flues raised above the line of roof-ridges, with all necessary capping, etc.

THIRD.—The performance of all work necessary to complete in every particular the inner dome and rotunda, which includes the placing of an ornamental glass dome at the head of the present interior circular colonnade, all window-glazing, etc., the building of a circular gallery on the line or on the level of each floor of the main building and all ornamental work such as cornices, capitals, railings, wainscoting, pavements, staircases, etc., together with an elevator in the shaft adjoining the rotunda on the westerly line, and continuing to the top of the dome. Three rooms should also be provided in the square shaft on the easterly line adjoining the office of the Mayor and the Board of Education, together with all necessary decorations.

FOURTH.—The general reparing of all injured work in rooms, and especially in the corridors, throughout the entire building.

SIXTH.—Providing for each court-room a steel vault for the reception of valuable documents.

SEVENTH.—Repairing all exterior cast iron work, such as columns, capitals and other minor ornamentations which at this date show the need of such attention.

The cost of the above mentioned work is as follows:

Fire-proof roof	$165,000
Attic walls, flues, skylights and ventilation	55,000
Inner dome and rotunda complete	65,000
Elevator from first floor to top of dome	11,000
Repairing of all work in rooms and corridors	5,000
Plumbing repairs	6,000
Steel vaults	4,000
Painting, etc	5,000
Total	$316,000
Total cost of building to date	$5,049,000
Estimated cost of building, complete	$5,465,000

LEGAL DECISIONS.

LIABILITY OF ACCEPTOR.—Where a contractor entered into a written contract for the erection of a building, and gives an order on the owner in favor of a material man who was furnishing materials for the erection of the building, in payment or security for such materials, payable when the next payment on the contract becomes due, which order was accepted by the owner, in order that he might make such payment or give such security, and also to obtain credit for a further supply of materials for the same purpose and these facts being known to the owner. It was held the object of the acceptance being to assure the further progress of the completion of the contract for the erection of the building, that it established a good consideration as between the owner, and acceptor, and the drawee for the acceptance; and that, upon the completion of the contract to the next payment the owner became liable to pay the order thus accepted and that it was immaterial whether the contractor performed the remainder of the contract or not. If the acceptor of such an order chose to pay the contractor for the erection of the building, as if he had completed the contract to the next payment, he would be estopped from denying his liability in an action upon the acceptance when it became due and payable; and so where an order is drawn upon a fund to be paid upon the happening of a condition, which order is accepted, the acceptor cannot either by his own act or by acting in collusion with the drawer of the order, defeat the condition, and then set up such defeasance as a defense to an action upon the acceptance.

Herter v. Goss & Edsoll Cp., Supreme Court of New Jersey, 30 At. Rep. 252.

LIABILITY FOR NEGLIGENCE OF FELLOW SERVANTS.—Where a workman is injured by the fall of a derrick occasioned by the neglect of another employe in charge of the derrick to provide a check rope, the master is not liable.

Jenkinson v. Carlin, City Court of Brooklyn, General Term, 30 N. Y. Supp. Rep. 530.

MECHANICS' LIENS UNDER AN ENTIRE CONTRACT.—Under an entire contract for the erection of buildings on lots not contiguous to each other, one claim for a mechanics' lien may properly be filed against both improved properties where the claimant of such lien contributed material or labor to both improvements.

Bohn Sash and Door Co. v. Case, Supreme Court of Nebraska, 60 N. W. Rep. 578.

RIGHTS OF ADJOINING OWNERS TO PARTY WALL.—An adjoining owner of a party wall has a right to increase its height; and where he contracts with an independent contractor to have this done in a lawful, proper and usual way, so that the work does not become, in itself, dangerous or extraordinary, and does not subject the existing wall to overweight, he is not liable for the damage incident to the falling of the wall through some accident.

Negus v. Becker, Court of Appeals of New York, 38 N. E. Rep. 290.

THE SUPREME COURT OF IOWA HOLDS, that one acting for an investment company in the construction of a building, under a written agreement requiring him to make all contracts for material and labor in his own name, and to be the party responsible thereon, receiving partial payment in the stock of the company, but reciting that the company desires to employ him "in the construction" of the building, and providing for the letting of contracts by him for work and material "subject to the approval of the company," requiring him to devote his whole time to supervision over such labor and materials, and to furnish the company with a statement of the cost of work and material, and providing that he shall receive ten per cent of the cost of certain labor and material "in full for his services in looking after the execution of said contracts and superintending and supervising the entire construction of the building," will be regarded as a servant of the company, and not an independent contractor.

Hughbanks v. Boston Inv. Co., 60 N. W. Rep. 640.

FACTS CONSTITUTING WAIVER OF ARCHITECT'S CERTIFICATE.—By the terms of a building contract, a certificate was a condition precedent to payment, and upon the fact that such certificate had not been issued by the architect himself, was made the defense of the owner of the building to paying for the work done.

It appears that a certificate was presented, signed by the architect's name, per his assistant, and the claim was made that such certificate was ineffectual to entitle the contractor to payment. But it appeared that the architect with the acquiescence of the owner substituted the assistant for himself in the preparation of the specifications and superintendence of the building; that the architect was never on the premises and never saw the work; that the architect authorized the assistant to issue the certificates; that the owner after making the contract never met the architect, and conducted all his business with the assistant; the extra work was planned and executed by the assistant; that when the latter proposed to furnish the final certificate, the owner made no objection to its issuance by him, but only solicited delay; that other certificates had been so issued and had been paid; and that when the final certificate was issued and presented, he accepted it without objection, and promised to settle next week. The contract also provided that that the contractor should permit anyone appointed by the architect to inspect the work. The court held, on the above statement of facts, that the owner had waived the condition of the contract as to the issuance of the certificate by the architect, and assented to the certificates by the assistant, as the clear conclusion of reason and justice.

McEntire v. Tucker, Court Com. Pl., 31 N. Y. S., 672.

BUSINESS MOSAICS.

The J. L. Mott Iron Works, New York, Boston, Chicago, St. Louis and San Francisco; if you refer to page v of this journal you will see what this firm claim to be "The desideratum in modern plumbing," that is to have the various appliances set up open and accessible and wherever possible without cabinet work.

It is only necessary to examine their work to be convinced of the truth of the claim, and every day people are coming to think the same way, as may be seen in the new houses that are constructed upon the most improved plans all contain this open work idea. Information and circulars will be furnished upon application at the San Francisco office, room 35 Flood building, M. S. James Pacific Coast Representive.

Tramp—"I ain't had nothin' to eat for a week, sir. Can't you do suthin for me?" PEDESTRIAN—"Certainly; fast for two months and I'll get you a place in a dime museum."—*Harper's Bazar.*

Joseph Budde, the manufacturer of sanitary appliances in the plumbing line is too well known, and has received so many medals and diplomas from the State Fair at Sacramento that it may seem useless to call attention to the excellence of his work, as the popular Golden Gate Patent Water Closet speaks for itself, we need only to call attention to the fact that Mr. Budde can always be found at his ware rooms, 575 Mission street. An inspection of his stock is all that is necessary to secure an order from those in want of his line of goods. See his advertisement on page vii of this journal.

New Yorker (in Washington)—"I have a gold piece in my pocket that—" Washington—"Ssh! Keep it dark." New Yorker—"Heavens! What's the matter?" Washington—"If Cleveland and Carlisle learn that it's there they'll want to borrow it."—*North American.*

California Art Glass Bending and Cutting Works.—The artistic manner in which this firm finishes church memorial windows is worthy of all praise, their exhibit in the Liberal Arts Building at the California Midwinter International Exhibition was awarded a first prize gold medal. If you visit their show room you will be convinced that what they do, is done well, any work intrusted to their care is sure to turn out to the satisfaction of their patrons. Wm. Schroeder is president of the company, 105 Mission street cor. Spear, San Francisco, Cal.

They have just engaged one of the most celebrated artists in glass staining in the United States, as he just comes from the east where he was employed by some of the largest art glass works, he is full of new ideas which will be an inovation on this coast.

She—"I hope, Oscar, you are not marrying me for my money?" HE—"Bless you no! My creditors will get all of that."—*Blaetter.*

The Joshua Hendy Machine Works, 39-51 Fremont street will furnish all kinds of castings, light and heavy, as well as architectural iron work; engines and pumps for buildings are also made specialties.

Facts about paint and Duresco the New Wall finish or washable color; this will certainly interest the ladies and therefore we can write about it with interest, what good housekeeper but is particular about her walls, and if she can find a wall finish, or washable water color that damp walls do not effect what more can she want, but in addition to these merits it is claimed by the manufacturers "It strengthens the wall and prevents crumbling" for further information on this subject call upon the manufactures, W. P. Fuller & Co., Pine and Front sts.

American Student—"You don't have football in Germany?" Germah Student—"No; the professors draw the line at duelling."—*Puck.*

Do not forget to specify "Samson Spot Cord" if you want a cord that will do good service, and also one that you can tell at a glance is the true article by its perfection of braid. Samson Cordage works, Boston, Mass., are the manufacturers of this valuable cord.

Judge—"You claim Mr. Coffin as a particular friend of yours?"- Mrs. Killboys—"Yes, your honor; he buried two of my husbands."—*Judge.*

Kenney & Wells, 422 Sutter street, San Francisco, 408-410 Twelfth street, Oakland, is the place to go for parquetry floors, wood carpet, mirrors; frames and pictures, as well as fine fretwork and grills.

"It's the little things that tell," as the man said when his 3-year-old boy saw him kiss the cook and carried the news to mamma.—*New York News.*

W. R. Grace & Co., are agents for the famous Portland Cements "Josson" and "North" 203 California street, San Francisco. If you use cement, get the best, a word to the wise is enough.

Maud—"Don't you think that Mr. Totterly is too old to love?" MARIE—"I don't know. But he is rich enough to be loved."—*Ex.*

F. H. Rosenbaum & Co., depot of plate and window glass is at 567 Market street opposite Sansome, they also manufacture mirrors in both styles.

When a man becomes firmly convinced that he is a genius, it is then that the fringe slowly begins to form on the bottom of his trousers.—*Harlem Life.*

Thomas Day & Co., will supply you with gas or electric fixtures, and you are sure to get what you order at 222 Sutter street.

South Streeter—"Jakey, how do you spell fife?" Jakey—"Vot you dinkin' of, dot leedle flute or de mark on dem tree-tollar pants?"—*Ex.*

If you don't want your door to slam leave order with G. Rischmuller for his door opener and closer.

CITY BUILDING NEWS.

Broderick near Oak. To build; owner, J. D. Sullivan; architect, T. J. Welsh; contractor, Jno. Kemp; signed, Jan. 31; filed, Feb. 4; cost $2500.

California near Eugenia. To build; owner, John Geherty; architect, M. J. Welsh; contractor, J. E. Schultz; signed, Jan. 10; filed, Jan. 14; cost $1600.

California near Baker. Plumbing; owner, Mrs. C. E. Clark; architect, W. H. Wharff; contractors, Berwick & Spinck; cost $95.

California near Polk. Alterations and additions; owner, Harriett S. Campbell; architect, W. H. Lillie; contractor, Geo. R. Lang; signed, Jan. 15; filed, Jan. 16; cost $2100.

Castro near 19th. To build; owner, James Curley; architect, H. B. Roulett; contractors, Rountree Bros.; signed, Jan. 7; filed, Jan. 24; cost $3960.

Day near Sanchez. To build; owner, M. and E. Schunmacher; architect, E. J. Vogel; contractors, Henderlong Bros.; signed, Jan. 25; filed, Jan. 29; cost $1600.

De Long Ave. near Frederick. To build; owner, Geo. D. Graham; architect, E. J. Vogel; contractor, M. J. Savage; signed, Jan. 13; filed, Jan. 14; cost $3430.

Eddy near Taylor. Alterations and additions; owner, Silas M. Locke; contractors, Riley & Loane; signed, Jan. 5; filed, Jan. 10; cost $2172.

Eddy near Taylor. Carpenter and plaster work; owner, Silas M. Locke; contractors, Riley & Loane; signed, Jan. 7; filed, Jan. 16; cost $1860.

Ellis near Scott. To build; owner, Mary A. Garness; architects, Townsend & Wyneken; contractor, D. Currie; signed, Jan. 14; filed, Jan. 15; cost $3890.

Florida near 25th. Additions to Clumbia Grammer School; owner, City of San Francisco; architect, T. J. Welsh; contractors, Constable & Hamilton; signed, Jan. 15; cost $3100.

Fourteenth near Folsom. To build flats; owner, Elizabeth Beck; contractor, H. R. Schmuckert; signed, Jan. 12; filed, Jan. 14; cost $4000.

Fulton near Pierce. Plastering, mill work, etc.; owner, Chas. E. Hansen; architect, W. Winterhalter; contractors, Schutt & Kreeker; signed, Jan. 20; filed, Feb. 1; cost $10,880.

Fulton near Pierce. Painting, graining, etc.; owner, Chas. E. Hansen; architect, W. Winterhalter; contractor, Henry F. Wagner; cost $1520.

Fulton near Pierce. Excavation, stone; brick work, etc.; owner, Chas. E. Hansen; architect, W. Winterhalter; contractor, Adam Beck; signed, Jan. 31; filed, Feb. 1; cost $2980.

Fulton near Pierce. Sewers, plumbing, etc.; owner, Chas. E. Hansen; architect, W. Winterhalter; contractors, Sheperd Bros.; signed, Jan. 31; filed, Feb. 1; cost $1495.

Grove near Schrader. To build; owner, J. J. Butler; architect, F. Butler; contractor, J. Weir; cost $1500.

Greenwich near Hyde. To build; owners, Paul J. Stuparich and Emily Stuparish; architect, H. Hess; contractors, P. Carmouche & J. Maguire; signed, Jan. 30; filed, Feb. 1; cost $3200.

Haight near Steiner. To build; owner, Raymo Angelo; contractor, Arthur Stevens; signed, Feb. 4; filed, Feb. 4; cost $3800.

Harrison near 21st. To build; owner, Michael Bobino; architect, C. M. Rousseau; contractor, Jos. Kennedy; signed, Jan. 31; filed, Feb. 1; cost $3000.

Hayes near Broderick. Frame building; owner, Henry C. Cischen; architects, Martens & Coffey; contractor, H. Behrens; signed, Feb. 4; filed, Feb. 8; cost $3390.

Java and Park Ave. To build; owner, Ella Megrane; architect, W. H. Armitage; contractor, C. Larsen; signed, Jan. 15; cost $2932.

Octavia and Hayes. Carpenter work and painting, owner, Mrs. Lizetta Reinle; architects, Stone & Cahill; contractors, Cannon & Thompson; signed, Jan. 10; filed, Jan. 16; cost $5738.

Lots 10 and 11, block West end map. To build cottage; owner, Miss Lizzie Walker; architect, M. J. Welsh; contractor, I. W. Colburn; signed, Feb. 1; filed, Feb. 2; cost $1550.

Market near 5th. Gas and electric light fixtures; owner, Miss Emma Spreckles; architects, Reid Bros.; contractors, Bush & Mallett Co.; signed, Dec. 21; filed, Jan. 15; cost $3500.

Mason near Geary. Stone and brick work on five-story brick building; owner, Hall Association of the N. S. G. W.; architect, A. C. Lutgens; contractors, Liebert & Hoffmann; signed, Jan. 9; filed, Jas. 10; cost $16843.

Mason near Geary. Terra Cotta Work; owner, N. S. G. W.; architect, A. C. Lutgens; contractors, Steiger Sons; signed, Jan. 15; filed, Jan. 15; cost $1800.

Masonic Ave. near Fell. Two three-story and one two-story frame buildings, ten flats; owner, C. D. Sailfield; days work; cost $20,000.

McAllister near Masonic Ave. One-story cottage; owner, Julia O'Kane; contractor, James J. Manseau; signed, Jan. 24; filed, Jan. 24; cost $1500.

McAllister near Masonic Ave. Two one-story frame dwellings; owner, John Otten; architects, Martin & Coffey; contractor, H. Behrens; signed, Jan. 24; filed, Jan. 24; cost $2985.

McAllister near Lyon. Two-story frame; owner, Louis Friedlander; architect, J. F. Kenna; contractor, T. C. Cockrane; signed, Feb. 5; filed, Feb. 6; cost $6650.

Mission near Fourth. Plumbing and gas-fitting on four story brick; owner, A. W. Wilson; architect, J. R. Miller; contractor, R. Rice; signed, Feb. 6; filed Feb. 9; cost $1990.

Mission near 4th. Elevator work; owner, A. W. Wilson; architect, J. R. Miller; contractors, Cahill & Hall Elevator Co.; signed, Feb. 5; filed, Feb. 9; cost $1595.

Pacific Ave. near Octavia. To build; owner, Elizabeth Dore; architect, Sam'l Newsom; contractor, C. L. Emmons; signed, Jan. 15; filed, Jan. 18; cost $6755.

Pine near Kearny. Mason and carpenter work on two-story brick; owners, J. B. Haggin, Loyd Tevis and Jennie Bull; architects, Kenitzer & Barth; contractors, Mahoney Bros.; signed, Jan. 11; filed, Jan. 11; cost $36,000.

Point Lobos Ave. Machinery and disenfecting oven; owners, La Societe Francaise de Remfoissance Mutuelle; architect, R. Chartney; contractors, Clot & Meese; signed, Jan. 18; filed, Jan. 21; cost $2625.

Point Lobos Ave. and Boyce. To build; owner, Annie M. Reilly; architect, T. J. Welsh; contractor, D. Emerson; signed, Jan. 28; filed, Jan. 30; cost $5125.

Point Lobos Ave. and 7th. To build; owner, H. H. Mahan; architects, McDougall & Son; contractor, Wm. W. Farris; cost $8500.

Reed near Washington. To build; owner, R. D. Cunningham; contractor, G. G. Gillespie; signed, Jan. 14; filed, Jan. 15; cost $2810.

Sansome near Broadway. Alterations and additions; owner, Kittle & Co.; architect, Clinton Day; contractors, Riley & Loan; signed, Feb. 6; filed, Feb. 6; cost $4755.

Sanchez near 23d. To build; owner, John H. Eichler & Wilhemina H. Eichler; architect, H. D. Mitchell; contractors, Petterson & Person; signed, Feb. 6; filed, Feb. 8; cost $3661.

Seventh near Point Lobos Ave. To build; owner, and builder, Geo. Constance; cost $3000.

Sixteenth and Noe. Remodelling of church; owner, Trinity Methodest Episcopal Church; architect, John Marquis; contractor, J. C. Kelly; signed, Jan. 12; filed, Jan. 26; cost $2430.

Tenth Ave. near Point Lobos. To build; owner, P. Bergren; contractor, J. L. McInes; cost $2500.

Twelfth Ave. near California. To build; owner, Wm. H. Matthews; architect, C. F. Robertson; contractor, C. Larsen; signed, Jan. 31; filed, Feb. 2; cost $2690.

Twelfth Ave. and Clement. Plumbing; owner, W. H. Mathews; architect, C. F. Robertson; contractor, G. C. Sweeney; signed, Feb. 2; filed, Feb. 6; cost $270.

Van Ness Ave. and Jackson. Hollow tile work; owner, Claus Spreckles; architects, Reid Bros.; contractors, Gladding, McBean & Co.; signed, Dec. 21; filed, Jan. 5; cost $21,670.

Van Ness Ave. near Francisco street. To build; owner, John Mussio; contractor, Miron & Gardner; cost $1500.

Valencia near Liberty. Completing unfinished building; owner, J. B. F. Davis; architect, J. C. Newsom; contractor, John Furness; signed, Jan. 12; filed Jan. 12; cost $2058.

Williamson near Point Lobos. To build; owner, John Moriarity; architects, Shea & Shea; contractor, A. L. Jacobson; signed, Dec. 18; filed, Jan. 17; cost $1200.

ALAMEDA

Alameda. Additions to Porter School; owner, Board of Education, architects, Laver & Mullany and W. J. Cuthbertson; contractor, F. L. Hansen; cost $9964.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

OF the defeat of the bill introduced into the California Legislature to Regulate the Practice of Architecture, there is little to be said except that the public is not yet educated to the importance of the measure, and the opposition that the bill encountered was mainly from parties who feared their personal interest would be jeopardized.

There is certainly no reason why an architect should not be entitled to the same protection that the lawyer and the doctor have at present under our laws.

The recent collapse of a building in New York whereby many people were killed and injured, the coroner giving as a cause the unskillful construction of the building, should be a warning to the public to intrust their building operations to skillful men, who have shown their ability by their works, as well as by passing an examination before a competent board of examiners, as required by this act.

The sober second thought of the public will eventually compel the Law makers to do justice to the architects and place the profession on the same standing, as the lawyers and doctors.

It has been the constant aim of architects of late years to raise the standard of requirements of those anxious to enter the profession. The Royal Institute of British Architects have of late been publishing the requirements of those about to enter the office of the architect, as well as having to undergo three examinations as they progress in their studies before being allowed to membership of the Institute.

In our own country the American Institute of Architects are more exacting every year in the requirements to enter their association; all this shows a very commendable desire upon the part of the leading architects to raise the standard among the profession and secure the proper qualification before admitting members.

This being the case, it would appear that the least the Legislature could do under the circumstances would be to offer some encouragement to those striving to build up our towns and cities in a creditable manner with due reference to the safety of life, security from fire combined with some artistic taste.

We will only add try again and better luck may be the result.

SERIOUS accidents and damages caused by quick running electric cars, calls our attention to the necessity of some different kind of road-bed for them than the present level of the public street.

When the traffic gets any way large in a city it is much put back in its goings and comings by passenger cars and by the same reason passengers by cars are delayed and put in danger by large traffic. It will therefore be absolutely necessary and is now very desirable to clear streets entirely of rapid transit. The cheapest and most desirarable way to do this is to place electric cars running overhead in the centre of the roadway—in narrow streets but one line, in broad streets two lines. The lines to be supported on rows of columns in centre of street—the rails only just high enough to clear the highest vehicle with its load—between these rows of columns put a Bicycle track and a path raised above said track for pedestrians who do not wish to look in shop windows and whose definite object is to make fast time. On the right hand side of this track must pass all vehicles going in that direction, on the left hand those coming in an opposite direction to the former—thus no chance for collisions and no confusion. Municipal regulation to arrange all this. The sidewalks need not be then near so wide as at present, having to accomodate only saunterers—so that vehicular traffic will have more leeway and people crossing the street will only have to look in one direction to prevent themselves from being run over.

Iron stairways at each crossing of streets are to run up to small landings above, where passengers will wait for the cars.

The advantages of this system are manifold:

FIRST—Unobstructed and therefore quick run for the cars.

SECOND—No danger therefrom to life or limb.

THIRD—Unobstructed and therefore quick run for vehicles and no danger of collision except at crossings.

FOURTH—Unobstructed and therefore quicker and less dangerous run for Bicylists.

FIFTH—And most important, danger from cars, vehicles and bicyles to pedestrians at a minimum—getting to the cars from centre walk easier and safer.

SIXTH—Pedestrians who wish to stroll or look at shops not pushed or hustled by those who may be in a hurry and those in a hurry not obliged to make their way through a slow walking crowd.

ALITTLE more than thirty years ago, the war cry of "On to Richmond" resounded through the country, to-day there is a prospect that the cry of "On to Richmond" will be renewed in this city, not as a war cry but in behalf of peace and peaceful homes.

Where is Richmond? we hear some one ask. Richmond is bounded on the east by First Ave. that gives promise of becoming the leading Boulevard of our city, connecting the Presidio on the north with the Golden Gate upon the south.

This section of our city has recently been sewered and drained in the most through manner and stands to-day as the most perfectly drained portion of our city.

Judging by the number of lots that have been sold the last season, building operations will be very active the coming spring and summer.

As people realize the advantage of living in such a healthy location so easy of access to the business portion of our city, this demand for building lots will increase till the fear of over-crowding will be the only objection. The doctors may object to this, as it is such a healthy place there is not much demand for there services.

If we examine the railway facilities we find them ample, the Sacramento cable road, the steam cars from California street to the Cliff House, as well as the Geary street cable cars all pass through Richmond. The Sutro electric road will soon be added to the number, all affording ample facility for reaching the business portion of San Francisco in a short time.

REPORT OF THE COMMITTEE APPOINTED TO COLLECT DATA OF AUTHENTICATED TESTS ON WASHINGTON BUILDING MATERIALS.

BRICK AND CLAY MATERIALS.

Continued from February Number.

WE beg to submit the following tables under the above heading of tests upon brick made at the Watertown Arsenal, and by Mr. Thomson, C. E., City Engineer of Seattle and the Vulcan Iron Works:

MATERIALS CONTRIBUTED AT THE WORLD'S COLUMBIAN EXPOSITION, CHICAGO, ILL.

J. W. REILLY,
Major Ordnance Dept. U. S. A.
Commanding.

SEATTLE, WASH., Jan. 9, 1894.

Messrs. Charles H. Bebb & C. W. Saunders, Committee on Tests of Washington Building Materials.

GENTLEMEN:—In reply to your request for information touching tests which I have made upon building material manufactured in Western Washington, I would say: My position has been such that my experiments have principally been made upon materials suited for paving and for the lining of sewers, and relate principally to brick.

In October, 1892, a large number of samples were submitted to me for examination in competitive bids for furnishing the lining of our sewer tunnels.

(1) The Denny Clay Company submitted samples of a very dark salt glazed brick, which upon examination and test, gave the following dimensions and behavior:—

Average dimensions, length 8 68-100 inches, width 4 26-100 inches, thickness 2 53-100 inches.

Average weight of brick, dry, 7 lbs. 12 7-8 oz.

Average weight of water absorbed during 72 hours immersion, 2 7-8 oz.

Average percentage of absorption 2 3-10 per cent.

Average specific gravity, 2.27.

One of the brick submitted with the above, showed a percentage of absorption of but 41-100 of one per cent, and had a specific gravity of 2.34, and many of the bricks delivered in our contract were equal in their density, although the average of some 310,000, remained just about the average of the samples. In attempting to crush one of these brick we applied a pressure, of 10,000 lbs. per square inch, and although we destroyed our testing machine, we did not make an impression upon the brick.

(2) The next samples tested were those presented by the Puget Sound Brick Tile and Terra Cotta Company. These brick were of a dark red color, and were made of fairly well pugged blue clay. Under test they showed as follows:—

Dimensions; length 7 68-100 inches, width 3 78-100 inches and thickness 2 26-100 inches.

Weight of brick, dry, 4 lbs. 12 2-3 oz.

Weight of water absorbed during 72 hours immersion, 4 1-6 oz., giving an average percentage of absorption of 5.43 per cent. Their specific gravity was 2.04.

(3) Pontiac Brick and Tile Company submitted samples, which clearly showed that they were poorly ground and poorly burned, and in as much as this company has since that time introduced new machinery, and new methods, the tests of these samples could not be taken as showing the character of present output. They gave as follows:—

Average length: 8 6-100 inches, width 4.00 inch, thickness 2 28-100 inches.

Their average weight was 4 lbs. 13 oz.

The average weight of water absorbed during 72 hours immersion was 11 1-2 oz., and the percentage of absorption 14 94-100 per cent and the specific gravity 1.82.

(4) The Seattle Brick and Tile Company also submitted a very large number of samples. These were of a very dark and dull red color, but were made of a well ground clay, and burned with coal in a down draft kiln.

Their average dimensions were; length 7 92-100 inches, width 3 78-100 inches, and thickness 2 39-100 inches.

Their average weight while dry was 5 lbs. 3 oz.

The average amount of water absorbed 4 1.3 oz., and the average percentage of absorption 5 25-100 per cent and specific gravity of 2 11-100.

Of these latter brick I have used about two million, and of these, the specific gravity has averaged 2 22-100, which is 11.100 better than that of the samples submitted.

Two firms have submitted paving brick, viz: The Denny Clay Co. and the Seattle Brick and Tile Co. The brick presented by the Denny Clay Co. had a specific gravity ranging between 2.21 and 2.35. These brick absorbed 2.29-100 per cent and 1 52-100 per cent of their weight in water respectively. I placed them in a foundry rattler, with about a ton of small sized scrap iron, and revolving the rattler at the rate of twenty-six revolutions per minute, gave them 16,600 revolutions. The softer brick lost 29 per cent of its weight, and the harder one, but 17 per cent, and both still retained, in fair degree, their original shape.

The Seattle Brick and Tile Company's pavers had specific gravities ranging between 2 17-100 and 2 32-100. These were also tested for absorption and showed 4 2-100 per cent and 2 37-100 per cent respectively, and when placed in rattler and given 16,600 revolutions, in connection with above one ton of scrap iron, they showed less of weight of 34 6-10 per cent and 15 6-10 per cent respectively.

From the above experiments I am able to say that we have in the vicinity of Seattle, clays, which under fair and reasonable treatment, will yield as perfect a brick as any I have been able to find from any place in the world.

Very truly yours,
R. H. THOMPSON.

THE VULCAN IRON WORKS CO.

SEATTLE, WASH., Sept. 21, 1894.

To Whom it May Concern:—

We have made the following tests of brick at the requests of the Seattle Brick and Tile Co., viz:—

			Commenced to Crack. Lbs. per sq. in.	Crushed. Lbs. per sq. in.
End Cut	Brick	No. 1	2500	3150
" "	"	" 2	2500	
Side "	"	" 1	Did not crush at 4646 lbs.	
" "	"	" 2	2250	2580
" "	"	" 3	2500	3460

Machine got stuck at 2800 lbs. per sq. inch and did not crush it, in testing End Cut Brick No. 2. We herewith testify to correctness of the above tests.

Yours very truly,
THE VULCAN IRON WORKS CO.
Per J. Hume,
Manager.

Your Committee begs to point out that the lists just read comprise tests made upon the materials manufactured by a very limited number of factories compared to the entire number in the State. Investigation demonstrates that there is not a State in the Union richer in all varieties of clay beds from the highest grades of pure Kaolin and fire clays, to the commonest low grade brick earth. The above tests though made upon material manufactured in the infant development of the clay industry in this State, compare favorably with tests made upon similar materials manufactured by any of the Eastern States, and competition among home manufacturers assures architects, owners and builders of yet higher grades in all lines of clay building materials. We are satisfied that the day has passed when the railroad companies will receive fifty per cent of the cost of high class clay materials, as the State of Washington has now within its limits more than one factory producing pressed brick, terra cotta and fire-proofing equal in quality to anything produced in the East.

We recommend the appointment of a new Committee to further investigate into the clay working industries of the State of Washington, that they prepare and submit a report upon the subject at the next annual convention embracing a record of tests made by acknowledged experts, and in order

that these tests may be really serviceable and valuable to the architects and manufacturers, we advise that a paper of suggestions for the conduct of tests upon various clay materials be prepared by them and a copy furnished the different manufactnrers of clay products. Such suggestions coming from a body of men forming indirectly the chief consumers of their products will, we believe, be received in good part.

LUMBER.

After the careful paper prepared by Mr. C. B. Talbot and read at our last regular meeting, it would seem there is not much left to be said under the above heading. If confirmation was necessary his paper confirms the fact that the State of Washington has almost unlimited stores of the finest lumber in the world for constructional purposes. Your Committee herewith submits the list of tests given by Mr. Talbot and made under his supervision, and has added thereto a table of ultimate fiber strains developed by each stick.

EXPERIMENTS ON ACTUAL BREAKING LOADS IN POUNDS ON YELLOW FIR AND OTHER TIMBERS—CAREFULLY SIZED—BY C. B. TALBOT AND OTHERS.

Size	Length	Clear Span		Deflection	Age	Breaking Load Lbs. per sq. in.
2x4 in.	4 ft.	3ft.-9in.	Y. Fir	5/16 in.	6 yrs.	3063 6891.75

9-1/4x16 in.	20 "	19 " 0 "	"	3/4 "	1 day cut		40408 6143.1
8-1/8x16 "	20 "	19 " 0 "	"	3/4 "	6 yrs. old		37041 5053.01
8x14 "	20 "	19 " 0 "	"	"	fresh cut cross grained		17317

This last specimen was selected as the worst possible sort and was so cross grained as to be entirely cut off one in three-and-a-half feet.

In working out these strains your Committee has taken the full length of the stick intead of clear span, the clear span would, of course, have given slightly higher results.

Herewith we also submit the lists of tests kindly furnished by the *Puget Sound Lumberman*.

RAILWAY TESTS OF DOUGLASS FIR.

Following is the result of tests of Washington fir made at mills at St. Paul and Tacoma Lumber Company, Tacoma, Wash., on March 12th and 13th, 1890, by A. J. Hart, Master Mechanic of the Chicago, Wilwaukee and St. Paul Railway Company, Milwaukee, under the direction of John T. Crocker, general purchasing agent, and B. W. Smith, timber agent of said road. At the tests made, Messrs. D. D. Clark, F. M. Haynes and C. B. Talbot, representing the Northern Pacific Railroad Company, were present and assisted in said tests:

Size of Stick	Length of Span	Moduli of Rupture	Fibre Strain
6-1/4x15-1/2 in.	18 ft.	25,284.57	5,391.1
6-1/4x14-1/2 "	15 " 9 in.	29,635.3	7,144.2
6-1/4x14-1/2 "	11 "	39,111.	6,585.
6-1/4x14-1/2 "	15 "	26,794	6,151.7 dry stick
8-1/4x16-1/2 "	19 "	45,277	7,560.9
9-1/4x16-1/2 "	19 "	25,094.	3,724.93 6 yrs old
8-1/4x16-1/2 "	16 "	39,672.75	5,591.63 3 " "
8-1/4x16-1/2 "	15 " 9"	54,722.76	7,458.41
8-1/4x16-1/2 "	19 "	22,104.3	5,263.5 dry stick
9-1/4x16-1/2 "	19 "	38,568.27	5,571.09
8-1/4x14-1/2 "	19 "	34,963 3	5,388.1
8-1/4x14-1/2 "	19 "	16,250.13	3,544.35 cull

The greatest deflection in any of these sticks was 3½ inches. The least deflection in any of these sticks was 1½ inches. In all these tests the centre load was applied.

TESTS OF FIR. RESULTS OF THE SECOND SERIES.

Further tests of the strength of fire lumber have been made by S. Kedzie Smith, city engineer of Ballard, and the *Lumberman* herewith gives the results. The tests were for transverse strength. The lumber, which was furnished by the Stimsen Mill Co., was forty days air seasoned and a little above the grade of good merchantable lumber. It was no better than would enter into good building construction. The bearing of the load on the beam was eighteen inches long and curved to a radius of six feet.

No. of Test Piece	7.	8.	9.

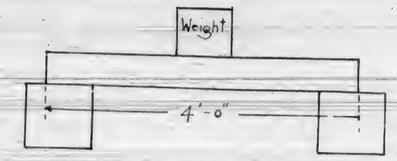
	10,200 1 18/32	
Breaking load	10,200 lb.	9,400 lb.
Stress in extreme fibre	4,605 "	4,255 "

Test No. 7 was a coarse-grained red fir.
Test No. 8 a close-grained yellow fir, near outside of log.
Test No. 9 a close-grained yellow fir similar to No. 8; lower edge close to sap.
Test No. 10 a medium fine-grained red fir; near outside of log.
Test No. 11 a coarse-grained red fir.
Test No. 12 a coarse-grained red fir.
Test No. 13 a coarse-grained red fir.
Test No. 14 a coarse-grained red fir.
Test No. 15 a coarse-grained red fir.
Test No. 16 a very coarse-grained red fir.

REPORT OF H. H. WARNER.

As to the strenth of our fir, I, with others, witnessed a test made by Engineer C. B. Talbot of the woods used in car and bridge building, viz: Fir, eastern pine and oak. Pieces were selected of good quality, 2x4 inches, 4 feet long, and tested as illustrated:



The following was the breaking pressure:

Fir	4,320 lbs.
Eastern oak,	2,428 "
Eastern pine,	1,610 "

It will be noted that the tables of ultimate fiber strains run the same average in the lists. It is perhaps not in the province of this Committee to give the fiber strains of woods grown outside of the State. It may be sufficient to point out that yellow Washington fir heads the list published in the *Puget Sound Lumberman* of all woods used for constructional purposes in regard to strength.

There are some points that your Committee wish to draw the attention of the Chapter to. The wide variation in the strength of the same material shown in the lists just read is one of them. The ultimate fiber strains vary from about 4,000 lbs. to nearly 10,000 lbs. per sq. in.; under these conditions does the Chapter consider that a sufficient number of tests have been made from which to adopt a reliable standard. It is a noteworthy fact, that as far as your Committee has been able to discover, there is not one hand-book of Engineering or Architecture that gives any information whatever in regard to Washington fir. We think this is an important fact which deserves consideration by the Chapter. Another point we wish to make is that we are informed that the cutting of trees and the logging business is carried on for the most part in the spring and summer of the year. It is perhaps hardly necessary to go back to the first writer extant on the subject of Architecture, but we find Vitruvius in the year 25 B. C. strongly condemning the practice. No timber to be used in important constructional work should be cut from growing trees while the sap is permeating every branch. Timber should be cut between the months of November and March. We are satisfied that sticks sawed from winter cut trees and properly seasoned will, when tested, show the best results; and as the use of such timber is only in conformity with the best engineering practice, we respectfully suggest the appointment of a Committee to draw up a resolution to that effect to be indorsed by the Chapter now in session.

Your Committee is satisfied beyond a doubt, that the tests so far made that have come to our knowledge, while showing high average results, do not do justice to Washington fir. Trantwine, Hatfield, Rankin, Laslett, and others give the moduli of rupture of *spruce* beams as from 8100 lbs. per sq. in. to 11,100 lbs. per sq. in., and of common white pine as from 10,000 to 13,000 lbs. per sq. in., no doubt derived from tests made upon small specimens, the results being necessarily larger than if derived from tests of full size timbers, as the smaller pieces do not contain as many imperfections as always occur in larger ones. Professor Lanza of the Massachusetts Institute of Technology, however, made some tests on full sized sticks of pine and spruce and the average of sixty-eight experiments gave only 5046 lbs. per sq. in. fiber strains, thus justifying the doubt as to the utility of the fiber strains given by the above mentioned authorities, even for ordinary work. There can be no doubt in the mind of any person acquainted with the three mentioned woods, that yellow fir should develop at least twice the strength of either of the others, which so far has not been the case. Architects and Engineers are still in the dark as to what average fiber strain per sq. in. they may safely adopt for our firs, and consequently, what factor of safety they may use.

We beg also to point out that it has long been considered that it is better engineering to determine as the safe load of a timber beam or joist, the load that will not deflect it more than a certain fraction of its span, in other words to take the bending moment in preference to the modulus of rupture. We are of opinion that the known data is insufficient from which to make a reliable table of deflection under given loads.

Finally we would suggest that further tests be made under the direction of some competent Committee appointed by the Chapter and from these and former tests, some standard be recommended for adoption, and that the information, when obtained, be forwarded to such well known authorities as Trantwine, Kaswell, Hatfield, Kidder, etc., to be published at their discretion in the annual editions of their hand-works.

Your Committee has not had the time to carry their investigations into the other building materials of the State, and while we realize how incomplete this report is, we have done the best with the time at our disposal.

Respectfully submitted,

CHARLES W. SAUNDERS }
CHARLES H. BEBB } Committee.

THE EXAMINATION FOR ADMISSION TO CANDIDATURE: AN HISTORICAL NOTE.

Continued from February Number.

THE first Examination under By-Law XIV. was held in March 1882, and two others were held the same year, in July and November, under the charge of a Board appointed by the Council, the regulation being that the number on such Board should not be less than five Fellows nor more than twelve. As a matter of fact, the first Board of Examiners in Architecture which ever met at the Institute were appointed in November 1880, and consisted of the President (the late John Whichcord), the three Vice Presidents (Professor Hayter Lewis, the late Sir Horace Jones, and Mr. Ewan Christian), the Hon. Secretary (Mr. Macvicar Anderson), with Messrs. James Brooks, Arthur Cates, E. A. Gruning, E. H. Martineau, E. R. Robson, Alfred Waterhouse and T. H. Watson. The newly-appointed Board conducted the last of the Voluntary Architectural Examinations; and, at the meeting of the 20th May 1881, Street, who was then President, occupied the Chair. His immediate successor in the presidential office—the late Sir Horace Jones—presided over the Board at the first Examination under By-Law XIV. held in March 1882, vacating it at the Oral Examination in favour of Mr. Arthur Cates, who has been periodically re-appointed Chairman of the Board, and has conducted almost every Oral Examination since the beginning of that year.

Five years after the introduction of Examinations under

By-Law XIV.—a By-Law made under the provisions of the Charter granted to the Institute by William IV.—a second Charter repealing some of the provisions of the earlier one was obtained from Her Majesty the Queen in Council. The grant was made by a Deed executed 28th March 1887, and the third section of this Charter contains the words "From the date of this our Charter every person desiring to be admitted an Associate shall be required to pass or have passed such Examination or Examinations as may be directed by the Royal Institute." Power was given at the same time, under Section 21, to grant Diplomas and Certificates in connection with Examinations, and to make By-Laws which should define, regulate, and prescribe the relations of the Institute to other Sociaties having kindred aims and purposes.

A few months after the grant of the new Charter an important Conference of Architects was held in London. At one of the meetings held 4th May 1887, it was recommended: (1) That the Institute should undertake the guidance and direction of professional education; (2) that a scheme of a complete system of examination should be prepared; (3) that such system should comprise a Preliminary, an Intermediate, and a Final or Qualifying Examination; and (4) that this system of Progressive Examination should be arranged with the co-operation of local Societies in the United Kindom. At another meeting, held the next day, it was further recommended that the Institute should be the centre of any federation of the members of the profession within the British Empire, and that such object might be best attained by connecting the various local Societies which existed, or which might thereafter be formed, with the Institute. Other cognate matters were discussed by the Conference, but the two above signalised were the most important. A great deal of minute and careful attention was given to both subjects in the course of the two subsequent sessions, and the scheme of Progressive Examination was approved by a Special General Meeting of the Institute, held 8th April 1889. At the same meeting the Architectural Societies of Bristol, Leicester, Liverpool, Manchester, Nottingham and Sheffield, with the Royal Institute of the Architects of Ireland, the Glasgow Institute, and the Northern Architectural Association—nine in all—were admitted to alliance with the Institute under the provisions of By-Laws than recently approved by the Privy Council. Since that time six other bodies in England, Scotland and Wales, with another in Australia, have been similarly admitted to alliance; with what results may be seen in the *Kalendar* last issued to members. The same issue of this work gives the fullest description yet published of the three Progressive Examinations. At the present hour the Probationers number 631, the Students 130; and the number of those eligible for candidature as Associate exceeds 100, with a reserve of 113 applicants relegated from previous occasions, and having the right of admission to the "Final" to be held next March and subsequent Qualifying Examinations.

The above applies only to the class of Associate. All the machinery in force, all the efforts to aid the education of architects and of architectural students, all that is sketched in the foregoing review, concerns admission to candidature as Associate. But the new Charter of 1887, under Section 3, lays down that from the 28th March 1892 the Institute shall have power to declare that every person desiring to be admitted a Fellow shall also be required to have passed an Examination. Although nearly three years have elapsed, the only "Examination" for admission to candidature as Fellow is contained in a "Regulation" for carrying into effect By-Law 3: that after the 1st November 1893 every such person shall submit to the Council, as evidence of his abilities as a practising architect, drawings, or photographs, of his executed works, accompanied with a signed declaration that the said works have been designed by himself. Since that Regulation was passed thirteen persons, of whom ten were already members in the class of Associate, have been elected Fellows; while, during the same period, 76 Associates have been added to the Register. The number of Associates is now 873, and there are more than 100 candidates, 64 of whom passed the recent Examination, eligible for election to that class; while the Fellows, who in October 1892 numbered 617, and in January 1893, 621, now number 611. Before the next Annual General Meeting it may be confidently anticipated that the number of Associates will far exceed 900, while that of the Fellows will show little increase. One of the main results of the Charter of 1887 is an apparent shifting of the preponderance of power, in the ordinary affairs of the corporate body, from the Fellows to the Associates of the Institute.—*Journal of the Royal Institute of British Architects.*

SAN JOAQUIN RAILROAD.

IN the December number of this journal we had occasion to speak of the lack of enterprise shown by the Real Estate men of our city, and remarked if they had any pluck the San Joaquin Railroad would be well under way by this time. Since that time we are happy to say they have in a measure redeemed themselves and at the present time there is every prospect of a competing road being soon ununder way.

If this should meet the eye of any who have not yet subscribed to this deserving enterprise we hope they may be induced forward as they may gain the public weal by adding their names to the subscription list without waiting to be called upon.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.
SETH BABSON, Pres. GEO. W. PERCY, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
OCTAVIUS MORGAN, Pres. A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec'y. AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

PRACTICAL SUGGESTIONS RESPECTING THE VENTILATION OF BUILDINGS.

A REPORT TO THE STATE BOARD OF HEALTH. BY JOHN H. KELLOGG, M. D.

GENTLEMEN:—In obedience to your request, I herewith present in brief form a few suggestions and fundamental principles which it is believed may be found of service in arranging the ventilating system of public and private buildings. The sole effort has been to embody, in as brief and lucid a form as possible, the information which the writer has gathered during some years of study of the subject, and such facts as he has gleaned from his own experience in planning and superintending buildings of some size for hospitals and other purposes. The only recommendation offered for the plans and principles suggested is that they have borne the test of practical experiment in a satisfactory manner, which cannot be said respecting all the schemes for the warming and ventilation of buildings which have been offered in works on sanitary subjects published within the last score of years. In justice to himself, the writer ought to say that he has not undertaken to make this paper exhaustive, or anything more than what its title indicates; neither has he undertaken to enter the field which properly belongs to the architect, but rather to present simply such suggestions and theories as he has himself found of practical value, and which are susceptible of general application, omitting altogether the minor details, which, however necessary to the adaptation of a general plan or principles to any particular case, are likely to be of little service except in the special conditions to which they are specially adapted. Seeking, then, to avoid as much as possible, redundancy of language and circumlocution in methods of presentation, let us begin at once the discussion of the things most essential in a correct scheme for the proper ventilation and heating of a building.

First of all, it may be stated that the ventilation and heating of a building must be considered together, for a successful working of each will depend upon the conditions of the other. It needs no argument to impress the fact that the amount of heat to be furnished in any given instance must depend very largely upon the amount of fresh air to be supplied per hour or minute. If the air of a room is to be changed four times per hour, certainly a proportionately larger quantity of fuel must be consumed than if the air is to be changed but once an hour.

The air supply of a room or building is generally determined by its size rather than by the number of persons by which it is to be occupied. This is certainly not a scientific method. A large room, occupied by but one or two persons, might possibly admit through cracks about windows and doors, and through its porous walls a sufficient air supply; while a small room, crowded with people, would require a very large provision for the supply of fresh air. The first thing, then, to be considered in the study of the ventilation of a room or building is the number of persons who are to occupy the space under consideration.

According to the most eminent sanitary authorities of England, each healthy adult person requires not less than three thousand cubic feet of air per hour. This statement is based upon careful experiments, which showed that if the normal quantity of carbon di-oxide contained in the atmosphere, which is two parts to every five-thousand parts of air, is increased to three parts in five thousand of air, the limit of tolerable impurity is reached; that is, if the amount of CO_2 is increased by respiration to a larger proportion than that stated, namely, three parts in five thousand, the air thus contaminated becomes productive of disease. It must not be supposed that the poisonous properties of such air are due to the chemical compound CO_2. Air may contain a much larger proportion of CO_2 provided this compound is derived from purely chemical sources, without injury being apparent. But when the CO_2 is furnished by the respiration of animals, there is association with it a subtle poison, which has been shown by the eminent physiologist, Prof. Brown-Sequard, to be one of the most powerful poisons known, exceedingly minute quantities being sufficient to produce death.

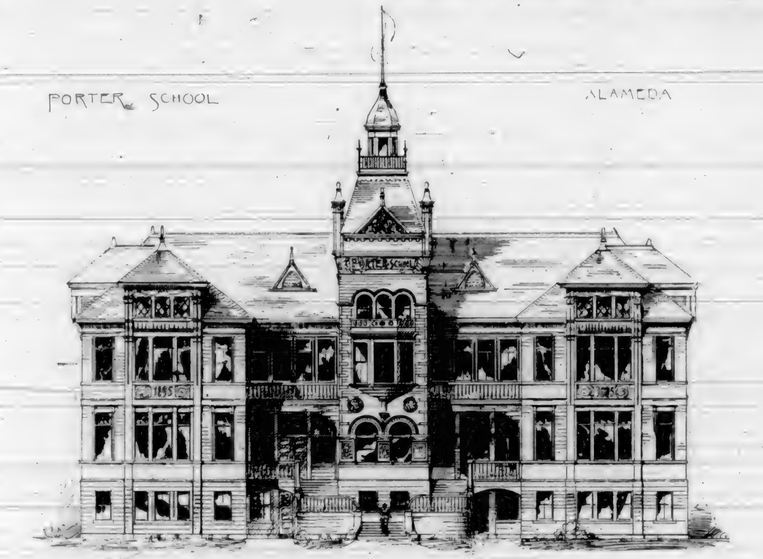
A little computation based upon the experiments referred to will show that Dr. Parke's figures are certainly not extravagant. With each breath, each human being exhales into the air one cubic inch of carbon di-oxide, and a definite amount of organic poison associated with it. As air naturally contains two cubic inches of carbon di-oxide in every five thousand cubic inches of air, and as an additional cubic inch of CO_2, or three cubic inches in five thousand cubic inches of air is the limit of safety, it is evident that each breath renders unfit for further use, five thousand cubic inches, or approximately, three cubic feet of air. The average person breathes eighteen times per minute; consequently each person spoils or renders unfit for further use, 3x18, or 54 cubic feet of air per minute; 54x60 gives us, as the amount of air which each person contaminates per hour, 3240 cubic feet, a slight excess over the amount named by Prof. Parkes. Some other authorities place the line of dangerous contamination at a somewhat higher point, and consequently they require a smaller amount of air. Avoiding either extreme, we may place the amount of air required per hour for each healthy person, at about 2400 cubic feet. It must be understood, however, that this rule applies to healthy persons only, and it is not applicable to hospitals or buildings occupied by infirm or sick persons. For such institutions, and for manufacturing establishments in which the air may be contaminated by chemical or other processes, at leased double the amount named, or 5000 cubic feet of air per hour must be supplied. In any given case then, to ascertain the amount of air required per hour, we have only to multiply 2400 or 5000 as the case may be, by the number of persons to be supplied with air. The number of persons taken should be the maximum rather than the minimum number which the room or building is calculated to accommodate, for the evident reason that the capacity of a ventilat-

ing shaft, duct or opening, may be easily diminished, but cannot be so readily increased.

Having determined the amount of air required in any given case, the following important practical points remain to be determined:—

1. The circulation of the fresh air.
2. The area of fresh-air inlets.
3. The area of foul-air outlets.
4. The location of foul air outlets.
5. The construction and location of foul-air ducts.
6. The location, sectional area, and height of ventilating shafts.
7. The question of artificially assisting the draft by means of a pressure or suction fan, or by means of heat in the ventilating shaft.

We will consider each of these several questions in the order named.



ADDITION TO PORTER SCHOOL, LAVER & MULLANY AND W. J. CUTHBERTSON, ARCHITECTS.

1. A room cannot be properly ventilated without an efficient arrangement for the circulation of air. For this there must be for each space to be ventilated at least two openings: one for the admission of fresh air, the other for the removal of impure air. Nothing could be more absurd than the frequently witnessed attempt to ventilate a room by supplying it with a ventilating shaft connected with proper ducts and foul-air openings, but without any provision for a supply of fresh air. Such an arrangement is eminently well calculated to produce dangerous drafts through the opening of windows, and the impression that any attempt at efficient ventilation is liable to result in failure. It is also essential for the proper distribution of the air admitted to a room that the air shall be heated before it enters room or building, or at the moment of entering.

2. To determine the required area of fresh-air inlets, the amount of air required and the velocity at which the air is to travel must be known. Air heated to a temperature of 40° F. above that of the external air will travel at the rate of about five feet a second when entering a room of ordinary height, from which it may escape readily. If the escape of air from the room is assisted by means of an efficient ventilating shaft, the velocity of the incoming air may be safely computed as ten feet per second. If the fresh air enters the room at a temperature so high as 120° F. to 150° F., the velocity of the air-current will be increased to 12 or 15 feet per second. Better practical results are obtained by large volumes of moderately heated air, traveling at a moderate speed, than from super-heated air traveling at a high velocity.

Calculating the velocity of the incoming air at ten feet per second, it is only necessary to divide the total amount of air required per second by ten, and the result will represent the area of free opening required. An allowance of at least forty per cent must be made when the openings are covered by register-plates. For example: Suppose the amount of air needed is 240,000 cubic feet per hour, sufficient to supply 100 persons with the minimum quantity of air. This requires 66⅔ cubic feet of air per second. Sixty-six and two-thirds divided by 10 is 6.6⅔. Adding 40 per cent for obstruction of register-plate, give us 9.3 square feet as the combined areas of the register-covered openings for admitting fresh air.

3. The number and location of the fresh-air inlets is not a matter of so great importance as is commonly supposed. If the fresh air enters the room at a temperature 20 to 40 degrees higher than that of the air of the room, it will go at once to the ceiling, no matter where or how admitted, and will thence gradually diffuse itself through the room, its course being chiefly determined by the location of the windows and of the foul-air exit openings. I think it preferable that the fresh-air inlet should be in the wall, near the floor, rather than in the floor, as it is by this means better protected against the accumulation of dust and dirt.

In the case of large buildings containing several floors and many rooms or apartments to be supplied with air, it is best not to undertake to carry a separate fresh-air duct to each room, but to equalize the air pressure within the building by leading large ducts to the common hall or corridor of each floor, supplying each room of each floor through open transoms or register plates placed near the ceiling. This arrangement secures a constant supply of pure air in the halls or corridors from which each room can draw, and establishes a constant current in the direction of individual users of the air, the foul air being directly removed from each separate room by its own duct. This plan secures the greatest possible safety from the dissemination of contagion or the dispersal of any element capable of producing dangerous contamination of the air.

4. Experience has shown that in order to prevent unpleasant draft, the velocity of the air at outlet openings should not be greater than five feet per second. The necessary area of outlet openings is readily obtained then, by simply dividing the total amount of air to be supplied per second by five. For example, suppose a room to be ventilated is calculated to accommodate thirty persons, each to be supplied with 2400 cubic feet of air per hour. The aggregate amount of air to be supplied will be 30x2400 or 72,000 cubic feet. Dividing this amount by 3600, the number of seconds in an hour, we have 20 cubic feet as the amount required for each second. Dividing this by 5, the velocity allowable, we have 4, which represents the necessary area for the foul-air outlets in square feet.

It must of course be understood that the figures thus obtained represent actual opening, and not an opening partially obstructed by a grate or register. As before stated, forty per cent must be allowed for when the opening is covered by an ordinary register.

As regards the proportion of the area of the foul-air exits to the area of fresh-air inlets, it may be said that outlets should be at least double the area of the inlets, since a velocity of ten or fifteen feet per second may be allowed without injury or inconvenience at the inlet, although such a velocity would not be tolerable at outlet openings.

TO BE CONTINUED.

EXPOSITION OF INDUSTRIES AND FINE ARTS OF MEXICO, 1896.

THE Federal Government has obligated itself to admit *free of duty* all materials and machinery for any buildings to be erected on the Exposition grounds, or the entire buildings imported for erection there, and, furthermore, it is expected that all building material used in construction of exhibition buildings and buildings entire for exhibition will be carried by the Railroad at one-half the regular tariff on same.

To this very important fact we desire to call the attention of Builders and Dealers and Manufacturers of Lumber, Machinery, Hardware, Glassware, Metal Roofing and Building Material.

It can readily be seen that there is open to our merchants a large and profitable field for their manufactures, taking in consideration the fact that at present there is in Mexico a great dearth of building material, the prices of which, under the tariff, were high. The exposition grounds will embrace an area of about 600 acres, and there will be ample space provided for the construction of all varieties of buildings of a desirable nature aside from the official buildings of the National and Foreign departments and buildings used by concessionaires, and at the close of the Exposition the material used in the construction of these buildings will find ready and quick sale to Railroads, Haciendas, Merchants, etc. It is projected that a large hotel on the American plan shall be erected on the grounds for the accomodation of such visitors as prefer the comforts of American civilization, and it is understood that this hotel will remain permanent, it being located in the suburbs, in close proximity to the city.

The Exposition will undoubtedly create a large demand for portable buildings, such as cabins, kiosks, stations, ticket offices, etc., which could be easily transported and readily sold at the close of the Exposition.

As contracts will be made for the erection of all of the main buildings of the Exposition as well as the buildings

for concessionaires and others connected with the Exposition, a great and legitimate profit could be realized by the formation of a stock company which could handle all of these contracts, and parties desiring to subscribe to the company could in lieu of cash furnish merchandise and material.

The advantage derived from the liberal privileges granted by the Mexican Government to our merchants on the occasion of this Exposition are such as should be eagerly sought for by those who have the interests of the advancement of American commerce at heart.

In the interest of the exhibitors of the United States a company has been formed at San Francisco, Cal., under the style of the American-Mexican Exposition Company, A. K. Coney, Consul General at San Francisco, President, of whom any further information regarding the Exposition can be obtained.

BOOKS AND PERIODICALS.

LIPPINCOTT'S MONLHLY MAGAZINE for March, contains one of Captain Charles King's delightful stories called "A Tame Surrender" for the complete novel. Among other interesting articles "A Glimpse of Cuba" will be found timely from the fact at the present time Cuba is undergoing one of her usual revolutions, or perhaps it would be more proper to write attempted revolutions.

INDUSTRY, a monthly magazine comes to hand for March containing a number of articles not only of general interest, but particularly so for the resident of this coast. "Constructive Engineering on the Pacific Coast," as well as "Ship Building" will be read with pride as showing the advance that is being make in the science of Engineering and Mechanical Arts on this Coast.

THE GOULD'S MANUFACTURING CO.—This company have just issued a handsome illustrated catalogue and price list of pumps and hydraulic machinery for every service. The headquarters of this establishment is at Seneca Falls, New York, with warerooms 16 Murray street, New York City. Having been founded in 1848, it is fair to suppose that their pumps and other machinery must be of great value to account for the large increase of their works, Woodin & Little, 312–314 Market street, San Francisco, is one of their principal branch agencies.

A number of tables giving capacity of round tanks and cisterns, dimensions, weight, etc., of wrought iron welded pipe horse power shafting will transmit; weights and measures, estimate of values of foreign coins, and many others will add greatly to the value of this catalogue as a book of reference.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

SUFFICIENCY OF STATEMENT OF MECHANIC'S LIEN.—A mechanic's lien stating that the labor was done and material furnished in improving the separate real estate of a married woman is sufficient to charge the property.

Reece v. Haymaker, Supreme Court Penn., 50 At Rep. 404.

CONTRACT WITH OWNER NECESSARY IN LIEN FOR MATERIALS.—A person claiming a right to a lien for labor or material furnished in the construction of a building must show that it was performed or furnished at the instance of the owner or his agent.

Sellwood Lumber & Mfg. Co. v. Monell, Supreme Court Oregon, 38 Pac. Rep. 66.

STATUTE FOR MECHANIC'S LIENS LIBERALLY CONSTRUED.—The statute by which a mechanic's lien is created was designed to protect material men, contractors and laborers; and, although in derogation of the common law, its provisions should be liberally construed, to the end that the intention of the legislature may be realized, and substantial justice done to all affected by its provisions.

Hill v. Alliance Bldg. Co., Supreme Court S. D. 60 N. W. 752.

LIABILITY FOR INJURIES TO ADJOINING OWNER.—One who erects a chimney on his land is liable for injuries to an adjoining owner by its fall, when it is not the result of inevitable accident, or wrongful acts of third persons.

Cork v. Blossom, Sup. Jud. Court of Mass., 38 N. E. Rep. 495.

DEFECT IN DESCRIPTION OF PROPERTY CURED BY EVIDENCE.—Where, in a building contract, on which a mechanic's lien is claimed the only description of the property was embodied in the statement that it was "to be erected on Avenue E, just north of U. S. Post Office building, in the city of San Antonio, Tex.," the defect, if any, in such description, is latent, and may be aided by extraneous evidence.

The order of the introduction of evidence is within the discretion of the court.

Myers v. Maverick, Ct. Civ. App. Tex., 27 S. W. Rep. 1083.

WHEN TAKING NOTE DOES NOT WAIVE MECHANICS' LIEN.—In the absence of an agreement or anything indicating an intention to the contrary, a mechanic or material man does not waive his right to file and enforce a lien merely by accepting for the amount of his claim the promissory note of the owner, at his request, and for the sole purpose of suspending his right to foreclose such lien for sixty days, at which time such note, according to its terms, matures.

Neither will the mere assignment of such note operate as a waiver or extinguish the lien, nor prevent the assignee from obtaining a decree of foreclosure, provided he has the note, and offers to surrender it at the trial for cancellation.

Hill v. Alliance Bldg. Co., Supreme Court S. D., Co. N. W. Rep. 752.

RIGHTS OF ASSIGNEE OF CONTRACT.—Where a vendor has made advances to the purchaser to enable him to erect a building on the land under an agreement that he should be secured by a lien, specific performance in favor of the assignee of the purchaser will be decreed, subject to the vendor's judgment for the money so advanced.

The assignee of an oral contract for the purchase of land, which has been partly performed, has the same right to specific performance as the assignor.

Dodge v. Miller, Supreme Court, 5th Dpt., 30 N. Y. S. 726.

EFFECT OF FAILURE TO AFFIX NOTARY'S SEAL TO CLAIM FOR LIEN.—The omission of a notary to affix his seal to the jurat in a notice of claim for a lien cannot be cured, at a trial of an action to foreclose the lien, by the introduction of parol evidence that the claim was in fact sworn to; and where the seal is affixed, and the name of the notary is omitted, parol evidence to the effect that the claim was in fact sworn to is equally incompetent; and the omission in each case renders both claims for a lien insufficient, when filed, to constitute constructive notice of the existence of such liens.

Such failures do not defeat the lien, but operates to postpone it to purchasers or incumbrances in good faith, without notice, whose rights accrued after the time within which the verified statement should have been filed. They are not available to one with actual notice of the existence of such lien, takes a quit-claim deed to the property, subject to all valid liens, under circumstances that fail as a matter of law to make him a purchaser in good faith.

Hill v. Alliance Bldg. Co., Supreme Court S. D., 60 N. W. 752.

BUSINESS MOSAICS.

When a man decides upon improving his shop, factory or farm, by the addition of power, he naturally looks for something entirely up to date. He investigates, considers, and finally decides to buy an Ajax Coal Oil Gas Engine as meeting his requirements more fully, and being safer, than any other power obtainable. Palmer & Rey, San Francisco, Cal., the manufacturers of this engine, have earned the gratitude of the public by placing within its reach a reliable, economical power, that defies the restrictions of insurance companies. It is the latest and best.

"**It's** the horse Oi don't bet on that always wins at the races," said Mr. Dolan. "An' somehow Oi never can remember to put me money on him an' let th' others alone."—*Washington Starr.*

The attention of architects and those contemplating building is called to the advertisement of "The J. L. Mott Iron Works" on page v of this issue. The high prices that had to be paid heretofore for the class of goods there shown has deterred many architects from specifying and owners from using same, but now this firm has made arrangements, by which these goods can be furnished at practically the same prices as first-class enameled iron goods. The merits of the solid porcelain goods are so well known that no comment is necessary. Their San Francisco agent M. S. James at room 35 Flood Building will give all information that may be wanted on this subject.

"**Haven't** you got this book in a chicken salad binding?" asked the Cheerful Idiot. "What do you mean?" asked the astonished bookseller. "Half calf."—*Indianapolis Journal.*

Merchant & Co. give a number of good reasons why their brands of tin should be used: First because you obtain the finest quality of Martin-Siemen's open hearth steel; second, because you get a uniform standard of coating all over the plate; third, because the coating is put on by a Palm Oil process and not by acid flux generally used on account of its cheapness. Therefore be careful to specify the world's best "Merchant's Old Method," "Merchant's Roofing," and "Alaska." The strength of a chain depends on its weakest link, the life and value of a roofing plate depends on its thinnest bit of coating. The value of Merchant's roofing tin is in the process and uniformity of coating, and the entire absence of acid flux.

"**Can** I write my name under the received payment on this bill?" asked the bill collector who likes to put things as delicately as possible. "No, thank you," replied Mr. Brokely, "I'm no autograph fiend."—*Washington Starr.*

The New and Improved Chapman Fire Hose Reel is the latest improvement and may be considered a very efficient and reliable apparatus, the manufacturer makes the claim that it is the best in the world. See their advertisement on page xii of this journal. R. S. Chapment, late Fire Suveyor for Board of Underwriters, 14 and 16 Fremont street, will give you further information, and a guarantee that what he sells is as represented.

George Goodman may be considered a benefactor of that portion of mankind that live in San Francisco, a man that makes the rough ways smooth can certainly be considered a benefactor; Artifical stone in all its branches with sidewalks and garden walk a specialty is what Mr. Goodman finds to fully occupy his time. 307 Montgomery street, Nevada Block, San Francisco.

Mrs. Quizby—"Why didn't you sell your house after pou advertised it?" Mrs Brown—"When we saw the description that the real estate agent gave of it, we thought it would be a paradise lost if we did."—*Philadelphia Inquirer.*

Phoenix Pure Paint is guaranteed absolutely pure and satisfactory on the building or we will replace it with any material the architect may select "This is what the manufacturers say of this article and when W. P. Fuller & Co. say a thing they mean what they say.

While you are discussing the paint question with this firm, it is a good time to inform yourself about "Duresco" their new wall finish or washable water color, if you are not already posted on that question.

Thar is the place whar the Major fell through the ice." "How do you know?" "Easy enough. Just look at that cork floatin' yander."—*Atlanta Constitution.*

Samson Spot Cord is a cord that speaks for itself, as you can see at a glance that no other cord is substituted; warranted free from wasts and imperfections. Send for samples to Samson Cordage Works, Boston, Mass., and you will be satisfied to use no other.

"**When** does this cough trouble your wife most?" Husband—"When she has her ear to the keyhole trying to hear what the new boarders are saying.—*Chicago Inter-Ocean.*

If you are in want of electric fixtures, and do not know where to find them, go to Thomas Day & Co., 222 Sutter street, where anything in the way of gas and electric fixtures are sure to be of the best quality in the market.

Caller—"We are very rich and wish to marry our daughter to a count, a marquis, or a duke. Clerk (with dignity)—You are in the wrong office. This is a matrimonial agency. You will find the International Purchasing Agency two doors to the left.—*Ex.*

Joshua Hendy Machine Works is the place to go for light and heavy castings. They are dealers in all kinds of machinery of their own manufacture, this company was incorporated Sept. 1882 having been engaged for years in furnishing engines and pumps for buildings and in fact machinery of all kinds for almost every conceivable purpose. 39 to 51 Fremont street are their headquarters, with foundry and warehouse at Kearny, Bay and Francisco streets.

CITY BUILDING NEWS.

Army near Valencia. To build; owner, A. Chamberlin; contractor, F. V. Acker; signed, Feb. 21; filed, Feb. 23; cost $4000.

Bush near Buchanan. Alterations and additions; owner, Patrick and Mrs. A. Walsh; contractor, John L. McLaughlin; signed, Feb. 15; filed, Feb. 18; cost $1120.

Bush near Laguna. To build; owner, Henrietta Ann Forbes; architect, R. H. White; contractor, John G. Adams; signed, Feb. 16; filed, Feb. 18; cost $6800.

Brannan near 8th. Two-story stable; owners, McNab & Smith; architect, Emil John; contractor, Geo. H. Walker; signed, Feb. 18; filed, Feb. 19; cost $8740.

Brannan near 5th. Rough carpenter work; owner, D. Nugent; architect, J. J. Clark; contractor, Cameron & McDonald; signed, March 6; filed, March 6; cost $6970.

Brannan near 5th. Brick for church; owner, D. Nugent; architect, J. J. Clark; contractor, San Joaquin Brick Co.; signed, March 7; filed, March 7; cost $7.87½ per thousand.

Birch Ave. near Buchanan. All work on a building; owner, Mrs. T. N. Van Ness; architects, Wright & Sanders; contractors, Liebert & Hoffman; signed, Jan. 3; filed, Feb. 20; cost $2300.

Bush near Laguna. Plumbing; owner, Henrietta A. Forbes; architect, R. H. White; contractor, G. C. Sweeney; cost $980.

Broadway near Stockton. To build; owner, N. Pucinelli; architect, E. Depierre; contractor, P. A. Antonelli; signed, March 9; filed, March 9; cost $9,000.

California and Jones. Brick and stone building; owner, Nob Hill Development Co.; architects, Buzbee & Gash; contractor, D. Jordan; signed, March 4; filed, March 11; cost $200,000.

California near Baker. Alterations and additions; owner, Margaret Skaine; architect, J. P. Brady; contractor, James O'Sullivan; signed, Feb. 20; filed, Feb. 25; cost $2165.

California Ave. near 30th. To build; owner, Nils Linberg; contractor, J. Gillogley; cost $1475.

California near Polk. Additions and alterations; owner, Samuel Moffatt; architect, H. W. Lillie; contractor, Geo. R. Lang; signed, Feb. 25; filed, Feb. 27; cost $2525.

Castro near 18th. To build; owner, Mrs. Mary Kipp; architect, John T. Kidd; contractor, C. W. Dodge; signed, March 1; filed, March 2; cost $3,600.

Capp near 16th. To build; owner and builder, G. Ratto; cost $6000.

Church and Liberty. To build; owner, Mrs. Mary E. Crawford; architect, W. H. Wharff; contractor, Jacob Schuler; signed, March 2; filed, March 8; cost $4225.

Creek Lane (Erie street) near Folsom. To build; owner, Albert A. Miller; contractor, H. R. Schmuckert; signed, March 9; filed, March 9; cost $2640.

Cora near Visitation Ave. To build; owner, Mrs. C. Bergold; architect, Geo. Strolmeir; contractor, H. A. Tessmer; signed, Feb. 7; filed, Feb. 15; cost $1150.

Cole near Waller. Six two-story frame residences; owner, William Hinkel; architect, Wm. Koenig; days work; cost $24,000.

Corbett Ave. near Hattie. To build; owner and builder, A. Murry; cost $2000.

Davis and Washington. Carpenter work on brick building; owner, Estate of A. Ivancovich; architects, Plesis & Moore; contractor, J. W. Wissinger; signed, Feb. 11; filed, Feb. 23; cost $8675.

Davis near Washington. Carpenter work, etc., on brick; owner, Issac Kohn; architects, Plesis & Moore; contractor, J. W. Wissinger; signed, Feb. 11; filed, Feb. 23; cost $5500.

Douglass near 17th. Additions; owner, Cal. Brewery Co.; contractor, A. Huller; cost $5000.

Diamond and 25th. Two one-story frame cottages; owner and builder, T. A. Born; cost $6000.

Diamond near 25th. Two-story frame dwelling; owner and building, T. A. Born; cost $3700.

Eighth Ave. near California. To build; owner, Mrs. Z. Hawkes; contractor, A. W. Goss; signed, Feb. 13; filed, Feb. 14; cost $1960.

Elizabeth near Hoffman. To build; owner and builder, J. Anderson; cost $2000.

Fell and Masonic Ave. To build; owner, Charles H. Phillips; contractors, White Bros.; cost $6000.

Fell and Masonic Ave. Additions and alterations; owner, Charles H. Phillips; cost $1000.

Folsom near 7th. Alterations and additions; owner, Harris Samuel; architects, Salfield & Kohlberg; contractors, Petterson & Person; signed, Feb. 20; filed, cost $1651.

Fifth Ave. near Clement. To build; owner, Ernest Webner; architect, A. J. Barnett; contractor, Ed. Mooney; signed, Feb. 27; filed, March 1; cost $1500.

Franklin and California. Concrete and cement work; owner, Edward Coleman; architect, W. H. Lillie; contractor, Geo. Goodman; signed, Feb. 28; filed, March 2; cost $2375.

Franklin and California. Plumbing; owner, Edward Coleman; architect, W. H. Lillie; contractor, H. Williamson; signed, March 5; filed, March 6; cost $962.50.

Geary near Leavenworth. Excavations, etc.; owner, Percy Klien; architect, Emil Depierre; contractor, James A. Wilson; signed, Feb. 27; filed, Feb. 28; cost $1700.

Golden Gate Ave. near Laguna. Additions; owner, Mrs. Annie Fallon; architects, Martens & Coffey; contractors, Ackerson & Peterson; signed, Feb. 23; filed, March 4; cost $2180.

Hyde near Broadway. To build; owner, Cornelius Harrigan; architect, J. C. Colbron; contractor, F. W. Maurice; signed, Feb. 5; filed, Feb. 13; cost $5300.

Hyde nerr Clay. Plumbing work; owner, Laura Hirshfeld; architects, Plesis & Moore; contractor, R. Rice; signed, Feb. 23; filed, Feb. 23; cost $1048.

Jackson near Locus Ave. Two-story brick; owner, Belle F. Lee; architect, Newton J. Tharp; contractors, Ingerson & Gore; signed, Feb. 12; filed, Feb. 15; cost $2852.

Jackson near Steiner. To build; John Sprunance; architect, J. H. Littlefield; contractors, Blanchard & Clark; signed, Feb. 15; filed, Feb. 19; cost $5345.

Kentucky near Sierra. To build; owner, Hans Kroeger; architect, H. Geilfuss; contractor, F. Klatt; signed, Feb. 28; filed, Feb. 28; cost $1402.

Kingston Ave. and Mission Sts. To build; owner, John Wiese; architects, Martens & Coffey; contractor, F. Weincehl; signed, March 1; filed, March 4; cost $4080.

Laguna near Vallejo. Concrete foundations; owner, Caroline S. Townsend; architect, W. H. Wharff; contractor, Chas. Quast; signed, March 4; filed, March 4; cost $1620.

Laguna and Jackson. Hydraulic Ram Elevator; owner, W. F. Whittier; architect, E. R. Swain; contractors, Cahill & Hall Elevator Co.; signed, March 1; filed, March 6; cost $1225.

Lott near Grove. To build; owner, Richard English; architects, Martens & Coffey; contractor, I. J. Walsh; signed, Feb. 20; filed, March 6; cost $2988.

McAllister near Devisadero. To build; owner and builder; H. Keenan; cost $500.

Mission and 24th. Repairs and additions; owner, Thusenelda E. Ingram; architect, T. W. McKee; contractor, Ed. Bowyer; signed, Feb. 18; filed, Feb. 19; cost $3100.

Mission near Main. Four-story brick; owner, Eliza T. Grosh; architect, William Patton; contractor, W. A. Butler; signed, March 7; filed, March 8; cost $32,500.

Octavia near Greenwich. Cottage; owner, Mr. Tracy; contractor, J. W. Smith, cost $2000.

Octavia near Greenwich. To build; owner, W. C. Latham; architect, H. T. Bestor; contractor, Christian Andreson; signed, March 9; filed, March 11; cost $1400.

Pacific Ave. near Octavia. Capenter, masonry, plumbing, etc.; owner, Mrs. Elizabeth Dore; architect, Samuel Newsom; contractor, Richard Sinnott; signed, Feb. 12; filed, Feb. 16; cost $7375.

Presidio Reservation. Excavations, etc., for boiler house; owner, U. S. Government; architects, Percy & Hamilton; contractors, W. H. Flaherty; signed, Feb. 19; filed, Feb. 21; cost $7000.

Presudio Reservation. Fort Point 1st brick dynamite building; owner, U. S. Government; architects, Percy & Hamilton; contractor, D. T. Francoiger; signed, Feb. 25; filed, Feb. 25; cost $1400.

Point Lobos Ave. near 5th Ave. Macadamizing, etc.; owner, La Societe Francaise, etc.; architect, Emile D pierre; contractors, Warren & Malley; signed, Feb. 13; filed, Feb. 14; cost $2100.

Polk and Elm. Cottage; owner, R. H. Lyod; architect, B. E. Henriksen; contractors, Doyle & Son; signed, March 1; filed, March 2; cost $3280.

Polk and Sutter. To build; owner, M. De Young; architect, Clinton Day; contractor, Robert Frost; signed, March 5; filed, March 6; cost $31,500.

Pierce near Greenwich. Alterations and additions; owner, F. G. Eickhorst; architect, Emil John; contractor, Alfred Neville; signed, March 4; filed, March 8; cost $1250.

Second Ave. near California St. Cottage; owners, Lee Kahn and wife; contractors, White Bros.; signed, March 4; filed, March 4; cost $2088.

Second Ave. near Clement. To build; owner, H. Frolman; architect, H. Kraetzer; contractor, B. J. Taylor; cost $3500.

Second Ave. near Lake St. To build; owner, Thos. G. Parker; architect, H. J. Kraetzer; contractor, Byron I. Taylor; signed, Feb. 15; filed, Feb. 15; cost $2800.

Steiner near Haight. To build; owner, Mrs. E. Winters; contractor, Casper Zwerlein; signed, Feb. 12; filed, Feb. 15; cost $2210.

Spear near Howard. One-story brick; owner, Janet C. Haight; architects, Herman & Swain; contractor, Daniel D. Cameron; signed, Feb. 16; filed, Feb. 18; cost $2575.

Spear near Howard. Brick and mason work; owner, Janet C. Haight; architect, Herman & Swain; contractor, J. O'Sullivan; signed, Feb. 20; filed, Feb. 20; cost $1848.

Shotwell near 15th. To build; owner, S. LeRoy; architect, F. Vandervecken; contractor, S. F. Building Co.; cost $4500.

Sixteenth and Church. Three-story frame and brick building and two-story frame in rear; owner, Joseph Harvey; architects, Havens & Toepke; contractors, Ackerson & Paterson; signed, Feb. 28; filed, March 4; cost $8100.

Taylor near Green. To build; owner, H. H. Christiansen; contractor, A. Waller; cost $2500.

Third Ave. near Clement. Cottage; owner, Geo. Allen; contractor, H. Rowe; cost $1800.

Tenth Ave. near Pt. Lobos. Cottage; owner, G. Schmelser; contractor, G. T. Paff, cost $1800.

Tenth near California. To build; owner, C. Stoltz; contractor, D. A. McIntosh; cost $2000.

Twenty-third near Folsom. To build; owner, Jas. H. & L. A. Anderson; contractors, Hyde & Cox; signed, March 4; filed, March 6; cost $1850.

Twenty-fourth and Sanchez. Cottage; owner, P. Gumm; contractor, R. Frost; signed, March 2; filed, March 2; cost $1828.

Thirtieth near Laikley. To build; owner, Peter Braunbeck; contractor Robert Frost; signed, March 2; filed, March 7; cost $1500.

Washington near Scott. To build; owner, Agnes J. Jones; architect, H. D. Mitchell; contractor, J. Norris; signed, March 2; filed, March 7; cost $4614.

Webster near Pine. To build; owner, L. R. Ellert; architects, Shea & Shea; contractor, James Mooney; signed, Feb. 12; filed, Feb. 20; cost $5400.

The California Architect and Building News.

Copyrighted 1895, by the California Architectural Publishing Company,

OFFICE, 408 CALIFORNIA STREET, SAN FRANCISCO, CAL., U. S. A

VOLUME XVI. APRIL 20th, 1895. NUMBER 4.

A MONTHLY JOURNAL DEVOTED TO THE ARCHITECTURAL INTERESTS OF THE PACIFIC COAST.

Published on or about the 20th of each month by The California Architectural Publishing Company. The Stockholders being Architects and others interested in the profession.

SUBSCRIPTION TO THE JOURNAL, - $3.00 PER YEAR IN ADVANCE.

ESTABLISHED 1879. INCORPORATED 1889
NOW IN THE SIXTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

OUR Eastern exchanges contain full descriptions of the Orchard street disaster and the attempts to place the responsibility therefor on the shoulders of the proper persons. The facts of the case are as follows: An interior cross wall of brick was to be carried by an iron girder, resting on the side walls of the building. The bearing was not sufficiently strong to carry the weight, and gave way with fatal results. The plans for the building had been passed on and approved by the Department of Buildings of New York City, and theoretically would have been within the limits of safety. Owing to the poor quality of bricks used, no bonding, and poor mortar laid in freezing weather, the disaster occurred. The Coroner's jury blamed the deputy inspector who passed the plans as being grossly careless, but the Grand Jury absolved him from blame.

The real responsibility appears to belong to the person supervising the carrying out of the work, and the Grand Jury who reported on the matter recommended "that no building be erected hereafter, or changes made to an existing building, without the employment of a duly 'licensed' architect who shall draw the necessary plans and specifications of the same and superintend the same from first to last during its progress" and also recommended that "no person be allowed to practice the profession of architecture, make plans and specifications for a building or superintend its erection unless duly licensed for that purpose and registered."

Public indifference and private greed and shortsightedness have so far hindered or entirely thwarted the efforts of the architectural profession to exclude by law, the incompetent and incapable practitioners, and it will take more than one fatal accident to interest the public in the important subject of safe building.

The law presented to our last California Legislature, designed to meet the requirements of the more complicated construction of advancing civilization, by restricting the right to practice architecture to those proving themselves competent, fared no better than the law proposed to the Legislature that preceded it, nevertheless the profession men, who see the necessity of some such law for the safety and protection of the public, will continue their crusades in this and other States, until they succeed in their meritorious

efforts to raise the proficiency of the architectural practioner to such a standard that fatal accidents will no longer be cause by faulty construction and imperfect execution. This can only be done by prohibiting the grossly incompetent from practicing.

THE MANUFACTURING INTERESTS OF THE PACIFIC COAST.

A PAPER READ BEFORE THE MANUFACTURERS AND PRODUCERS CONVENTION, BY MR. OSCAR LEWIS.

Mr. President and Gentlemen of the Convention:—

To every man connected with the manufacturing interests of the Pacific Coast (and especially to those engaged in the Building Trades) the necessity of this Convention is but too plainly apparent; and the varied interests here represented show to us all that it is not only one industry that is threatened with disaster, if not annihilation, but that all are alike passing through the most disastrous business depression that has ever visited California. We all of course expect to take our share of these periodical upheavals in industrial and financial circles that sweep over our entire country, but we know, that aside from this, manufacturing has been on the down grade for some years past, and each year sees a greater number of firms, either going out of business altogether, or becoming importers in part at least, of the various articles in which they deal.

"It is a condition, not a theory that confronts us." We cannot disguise it. The time has arrived, when not only the employer, but employe, the mechanic, the farmer, the merchant and the real estate owner, in fact all who have a hope in what California ought to be, must stand together, and putting aside our petty differences, work in harmony for the maintaining and building up of the various industries of this Coast.

In connection with the Building Trades let me give you some examples of selfishness, or short-sightedness, of some of our real estate owners and contractors—and I may truthfully say that a good many of them brought little more when they came to this State, than they did when they came into the world. But before doing so, I will say that our local architects, builders and workmen will compare favorably with any that can, or have been, imported from any part of these United States. We fall short only in the art of combining modern conveniences with modern ugliness, and some of us are bold enough even to attempt that; but at all events there is no reason why San Francisco mechanics should not build San Francisco's buildings.

Yet the iron stair cases and ornamental iron work, costing in the neighborhood of $80,000, of one of our large buildings on Montgomery street, was made by Winslow Bros., of Chicago. It was not even bid on here, as in the opinion of the Chicago architects of that building, it could not be done here. I do not think it could have been done here as poorly. It was condemned and would have been rejected, but for the delay such rejection would have caused. This fact, and that great boon to botch workmanship—lead and putty—pulled it through.

The carpenter, or mill work, the entire wood finish was also made in Chicago, shipped out here and nailed in position by a local contractor; and at this time over one-half of the wood-working, machinery and mill hands of San Francisco were idle, and hundreds of worthy men were standing in line for hours in the rain to obtain a card that would entitle them to work in the Park for a dollar a day.

Why only recently, in the midst of our excitement over the laudable "Valley" Railroad enterprise, we found time to send a small job of iron work to Winslow Bros. of Chicago, while iron-workers walked the streets of San Francisco idle. This reminds me of Artemus Ward, who was in favor of enlisting and sacrificing all his wife's relatives, including his mother-in-law to put down the Rebellion.

And yet, Mr. President and Gentlemen of the Convention, we are all more or less to blame in this matter, for it seems to be a California fashion to shout for the opposition and travel on the old line. Even at this moment, when all Californians seem to be banding together in their effort to build up the industries of the State and City, the Eastern drummer—or human toredo—is at work, boring around the architects' offices with his samples of interior wood finish, seeking to lay his plans to procure wood work that will soon be required for our large business buildings and residences that are now in course of construction.

Owners and Contractors of the Coast, give the mechanics of California a chance: If you want the Eastern woods that are not grown here, import the lumber and have the work done here, unless the Railroad treats you as it does the wire nail industry—charge sixty cents a hundred on wire rods or the raw material, and thirty cents on the finished article.

Gentlemen, it does seem to me that those of us who have invested large amounts of money in rolling-mills, shipbuilding works, wire works, foundries and wood-working plants, have made a mistake, when the great iron and steel manufactuer of Pennsylvania, can be fully represented and equipped on this Coast, by a very affable gentlemen, occupying a 7x9 office, containing a roller top desk and a telephone; and while thousands of extensive Eastern manufacturers and wholesale houses, are represented by nice young men with alligator skin grip-sacks, who adorn themselves with diamond pins, four-in-hand ties, Willie-boy coats and custard pie shoes, while the people of San Francisco sigh for a "Half-Million Club," so do I sigh for a half million clubs.

But enough of complaint: Admit it all, and what is the remedy? Boycott Eastern made goods? No! rather build up our own State and let others build up theirs.

It has been said that the high rate of wages prevents manufacturing. While it is true that wages here are higher than in the East, we hope that the rates in the East may be raised rather than ours lowered. However, notwithstanding the fact that both labor and materials are higher here, our greatest difficulty is local prejudice, and the limited market we have to supply: For we know that the cost of manufacturing is largely governed by the quantity of a given article manufactured.

It is to be hoped that this Convention will go far towards convincing the people of this Coast, without regard to age, color, or previous condition, that their true interest lies in standing loyally together, and so far as possibly supplying their wants from the home market. Use the California produced article, even if it costs a little more, for the extra cost will come back to you tenfold in the general prosperity of the State.

A competing railroad has been advocated. There would be some merit in that, for to us manufacturers it would be no lingering death, and we could rent our plants as storehouses for the reception of its cheap freight and Eastern made goods that would flood San Francisco.

After thirty-six years residence in California, I believe in her resources; I have faith in her people, and I feel that with the commencement of the Valley Road, and the general awakening of the people, the revival of our mining, agricultural and industrial interests, a new era of prosperity will be felt over our entire State and Coast: If on the other hand, the people will not awake, will not protect their own interests from the tomahawk of the middle-man, or the grasping greed of our soulless monopolies, then at least save us from the hands of the Health Officer, and give us an elegant funeral, as will, in the language of Jimmie McGinn, make it a pleasure for us to die; dig the grave wide, dig it deep, and place it face downwards so that we may gaze on Chicago.

CODE OF ETHICS,

IN CONFORMITY WITH THE BEST STANDARDS OF PRACTICE, RECOMMENDED TO ITS MEMBERS BY THE BOSTON SOCIETY OF ARCHITECTS.

Adopted by the Society, February 1, 1895.

SECTION 1. No member should enter into partnership, in any form or degree, with any builder, contractor, or manufacturer.

SEC. 2. A member having any ownership in any building material, device, or invention, proposed to be used on work for which he is architect, should inform his employer of the fact of such ownership.

SEC. 3. No member should be a party to a building contract except as "owner."

SEC. 4. No member should guarantee an estimate or contract by personal bond.

SEC. 5. It is unprofessional to offer drawings or other services on approval and without adequate pecuniary compensation.

SEC. 6. It is unprofessional to advertise in any other way than by a notice giving name, address, profession, and office hours, and special branch (if such) of practice.

SEC. 7. It is unprofessional to make alterations of a building designed by another architect, within ten years of its completion, without ascertaining that the owner refuses to employ the original designer, or, in event of the property having changed hands, without due notice to the said designer.

SEC. 8. It is unprofessional to attempt to supplant an architect after definite steps have been taken toward his employment.

SEC. 9. It is unprofessional for a member to criticise in the public prints the professional conduct or work of another architect except over his own name or under the authority of a professional journal.

SEC. 10. It is unprofessional to furnish designs in competition for private work or for public work, unless for proper compensation, and unless a competent professional adviser is employed to draw up the "conditions" and assist in the award.

SEC. 11. No member should submit drawings except as an original contributor in any duly instituted competition, or to secure any work for which such a competition remains undecided.

SEC. 12. The A. I. A. "schedule of charges" represents minimum rates for full, faithful, and competent service. It is the duty of every architect to charge higher rates whenever the demand for his services will justify the increase, rather than to accept work to which he cannot give proper personal attention.

SEC. 13. No member shall compete in amount of commission or offer to work for less than another, in order to secure the work.

SEC. 14. It is unprofessional to enter into competition with or to consult with an architect who has been dishonorably expelled from the "Institute" or "Society."

SEC. 15. The assumption of the title of "Architect" should be held to mean that the bearer has the professional knowledge and natural ability needed for the proper invention, illustration, and supervision of all building operations which he may undertake.

SEC. 16. A member should so conduct his practice as to forward the cause of professional education and render all possible help to juniors, draughtsmen, and students.

ARMY OFFICERS AS SUPERINTENDANTS OF PUBLIC BUILDINGS.

THE old scheme, of having officers of the United States Army superintend the construction of public buildings, has been revived, according to the Washington papers; and the usual frightful examples of the slowness of progress on such buildings, under the ordinary methods, are brought up to show how much more quickly they would be finished if the military arm took hold of them. To complete the alluring picture, we are told that the Congressional Library, which is nearing completion, under military direction, and has certainly been rapidly built, is "a gem of art," as if all we had to do, to scatter gems of art speedily around the country, was to transfer the Supervising Architect's office to the Army Headquarters. It is hardly necessary to say that this agitation is decidely pernicious. That the Congressional Library is a fine building, well and quickly built, we acknowledge with pleasure, but, notwithstanding the remarkable and exceptional qualifications of General Casey and Colonel Green for architectural undertakings, it is quite capable of improvement as a work of art, and the rapidity with which it has been carried out is due as much to the energy with which the officers cut off Congressional interference, and demanded appropriations, as to any hidden capacity of the military mind for making bricks and stones jump into their places without assistance; while the Pension Building, the other great example of military architecture, though quickly built, for the same reasons, is about as far from being a "gem of art" as any structure within our knowledge. The fact is that the people who can build most rapidly, skilfully and beautifully are the people who have devoted their lives to learning how to do so, namely, the architects; and the sooner the public stops dodging around them, and trying to utilize politicians and generals and carpenters and what not, in place of them, the better off it will be.—*The American Architect and Building News.*

PRACTICAL SUGGESTIONS RESPECTING THE VENTILATION OF BUILDINGS.

Continued from March Number.

FIVE. When a room is heated wholly or chiefly by warm air, the distribution of heat in the room will be almost wholly controlled by the location of the foul-air outlets. The natural course of the air current is this: the heated air

rises to the ceiling, spreads out, and coming in contact with the outer walls which are lower in temperature than the inside walls, especially the windows, it is cooled and falls to the floor. It is evident then that as the outer walls and the proportions of the room adjacent to them are necessarily the coldest part of the room, the circulation of the air through the room and the proper distribution of the heat will be facilitated by placing the foul-air openings along the outer walls and preferably under the windows. If the foul-air outlets are placed in an inner wall or at the floor near an inside wall, one effect will be to draw toward this opening warm air which ought to have been utilized in warming the outer walls. Another effect, and one of the most disagreeable features attending this method of placing the foul-air outlets, is that the air which has been cooled by contact with the windows and outer walls and by its greater specific gravity has fallen to the floor, will be drawn the whole distance across the floor to the opening on the opposite side, thus constantly maintaining at the floor a stratum of cold air. An arrangement of this sort is a very frequent cause of cold floors, and consequently cold feet, and the resulting headaches from which the occupants of such a room are almost sure to suffer.

The foul-air outlets should be placed as near the floor as possible. The opening may be in the base board or in the floor itself The only objection to the latter method is the collection of dust which is likely to be swept into the opening.

6. The ventilating ducts communicating with the foul-air outlets should have a sectional area equal to the free area of the openings with which they communicate. This capacity should be maintained until the duct reaches the ventilating shaft, and should be increased if several turns are made in the duct as each square turn has the effect to diminish the velocity of the air current nearly one-half. Square turns should never be made, and the ducts should be enlarged at the angles where a turn is necessary. In case a duct must be carried for some distance, its capacity should be increased fifty or even one hundred per cent to compensate for the great amount of friction occasioned by distance. The ventilating ducts should of course be made tight. For this purpose it is necessary that they should be lined with metal or some other durable material. Even well-seasoned lumber will shrink and open up large cracks, by which the efficiency of the duct will be very materially diminished. It is also a wise plan to construct ventilating ducts of some non-combustible material, or at least to line with such material as a caution against fire.

Only ducts coming from the same room or floor should be connected with a common ventilating shaft. Each story must have its own foul-air shaft; otherwise the counter drafts occasioned by the opening of doors and windows, especially in moderate weather, or the adverse influence of winds, will be certain to lead to contamination of the air of one room by the air of another room with which it is in communication through the common shaft.

It is of the utmost importance to supply each floor, and if possible each room, with its own independent ventilating shaft running as directly as possible to the open air without any connection with other ducts.

7. The location, sectional area, and height of the ventilating shaft, are questions of very great interest and practical importance. As regards location, it is always better that the ventilating shaft should when possible be located within the building, as in an inside wall; this insures a temperature equal to that within the building, and so secures a constant and positive draft, whenever the building is supplied with artificial heat. If, in addition, the ventilating shaft can be located adjacent to the chimney, or if the smoke can be carried up through it by means of a boiler iron stack or a stack constructed of sewer pipe, a still higher temperature of the air in the ventilating shaft and hence a better draft will be secured.

The sectional area of the shaft will depend upon the amount of air to be removed and the height of the shaft.

By a careful study of the tables of Parke and others, I have been able to construct a simple formula which is of great practical service in determining these two questions. The following is the formula: The square root of the height of a shaft, multiplied by the square root of the difference in temperature between the air in the shaft and the outside air, divided by four, equals the velocity of the air in the shaft in feet per second. In using this formula, it is of course necessary that two of the quantities should be known. The difference in temperature is a pretty constant factor. In fixing this the minimum difference should of course be chosen rather than the maximum, as a ventilating shaft which may have an ample capacity in extreme cold weather when the great difference between the external and internal air would secure a powerful draft, would be quite insufficient to supply the necessary amount of air in moderate weather. I have chosen as a basis for obtaining the minimum difference id temperature, the temperature of 45° F. for external, and 70° F., the usual internal temperature. As a temperature much higher than 45 degrees, doors and windows are likely to be opened, and hence the working of any ventilating apparatus would be interfered with. The difference between 45° and 70° is 25, which may be fairly taken as a basis for calculation.

The height of the ventilating shaft is usually determined by the architect, who considers it with reference to the architectural effect in the building. When this is given, we have but to take the suqare root of the known height of the chimney, multiplied by the square root of 25 which is 5, divide the product by 4 and you have as a result the velocity at which the air will travel in the shaft in feet per second. It only remains to divide the total number of cubic feet to be removed per second by the velocity of the air per second, and the result is the sectional area of the shaft which is sought. Let us take a simple example by way of illustration. Given the height of the shaft 50 feet, and the amount of air to be furnished 72,000 cubic feet per hour or 20 ft. per second, the formula would work out thus:—

$\frac{\sqrt{50}\times\sqrt{25}}{4}$=Vel. in fit. per sec.=9 fit. $\frac{20}{9}$=2.22 sq. ft., the necessary sectional area of the shaft.

If the area of the ventilating shaft is given, the height being left to be determined, it is only necessary to know the amount of air to be removed, the difference between the internal and external temperatures, and to fix upon the velocity at which the air shall travel. The sectional area of the shaft must often be determined by the conveniences of construction, being governed by the plan of the building. A very safe rule is to make the sectional area of the ventilating shaft equal to the combined sectional areas of all the ducts leading into it. It is possible to secure efficient ventilation with a ventilating shaft which is somewhat smaller than this, but this is unquestionably the safest rule to follow. To determine the rate at which the air will travel, it is only necessary to divide the amount of air in cubic feet required per second, by the sectional area of the shaft expressed in feet. With these data the determining of the required height is a very simple problem, using the formula which has already been given. An example will make this entirely clear.

Let us suppose that the conditions are as follows: air is required for 48 students. At 2,400 cubic feet per hour for each, the total amount needed would be 115,200 cubic feet per hour, or 32 cubic feet per second. The combined area of ducts of sufficient size to allow the transmission of this air at the rate of 5 feet per second would be 32÷5=6.4 square feet, and the velocity will of course be 5 feet. The question we have to solve is what would be the necessary height of the ventilating shaft to secure this velocity, the difference in temperature being 25° F. The solution of this very practical problem is extremely simple. Bearing in mind the formula we will let H represent the height of the shaft, D the difference between the internal and external temperatures, and V the velocity of air per second; $\frac{\sqrt{H}\times\sqrt{D}}{4}=V$. Substituting the quantities which are known we have the following: $\frac{\sqrt{H}\times\sqrt{25}}{4}=5$. Reducing we have $5\sqrt{H}=20$; $\sqrt{H}=4$: H =16; that is, the height of the shaft required by the conditions named would be 16 feet. In most instances it is more convenient to employ a smaller shaft and one of greater height. Let us suppose such a case, in which the amount of air required per second is the same, namely, 32 cubic feet per second, and the sectional area of the shaft 4 square feet instead of 6. Dividing the amount of air required per second by the area of the shaft we have 8 as the velocity per second (32÷4=8). Our formula then would be as follows: $\frac{\sqrt{H}\times\sqrt{25}}{4}=8$, reducing we have $5\sqrt{H}=32$; $\sqrt{H}=6.4$; H =40.96. In this case the height of the shaft would be practically 41 feet. By the same method the necessary height of shaft for any given area may be readily determined.

From an economical standpoint, other things being equal, it is far better to secure increased efficiency by increasing the size of the ventilating shaft rather than its height, for the obvious reason that the capacity of a shaft for removal of air increases directly with the increase in sectional area; whereas the velocity of the air current increases in direct ratio with the square roots of the heights of the shaft, thus requiring that the height of a shaft shall be quadrupled to double its efficiency, while it is only necessary to double its sectional area to secure double efficiency. There is also a loss by increase of friction and of cooling surface, and in the disproportionate increase of expense of construction. The cost of increasing the efficiency of a shaft one hundred per cent., by increasing the velocity of the air current, will be very much greater than in securing the same result by increasing its sectional area.

Cases occur, of course, in which the stronger draft secured by increased height of shaft is essential to the efficient working of a ventilating system, or the accomplishment of a specific purpose.

8. When possible to do so it is unquestionably preferable to so plan a system of heating and ventilation that it will operate efficiently by the aid of "natural draft" only. Such a system is as nearly automatic in its action as any ventilating system can be made. A draft which depends upon a mechanical apparatus, as a pressure or suction pan, or even upon a steam coil or other form of heating apparatus in the ventilating shaft, is very likely to be found defective when efficiency is most needed. I have visited many large institutions provided with large ventilating fans, and have never yet found one in which the apparatus was in constant operation. In many cases it had been inoperative for years and was not in running order. In one case I was informed that the fan was started "whenever the odors in the ward became so strong as to be very noticeable." To my nose the odors were at that moment very strongly pronounced, and yet the fan was not in operation. The noses of managers and attendants become accustomed to odors to the presence of which they are constantly exposed, so that they cease to be a proper means of testing the condition of the air.

Some years ago the writer visited a large hospital, the air supply of which was wholly dependent upon a fan which was a pressure blower, and hence so constructed that when the fan was not in operation the opening for the entrance of air through the fan was very small. The fan was placed in the mouth of a tunnel nearly eight feet in diameter, just about the proper size for supplying the air to the hospital at a moderate velocity, but the opening from the fan had a sectional area of only about four square feet. The hospital had been in operation for some three years. The fan had never been in operation since the opening day, as it was run by a separate engine and was so far from the building as to require the attention of a special engineer when in use, and consequently the air supply of the hospital, which was filled with sick people of all classes, was limited to the small opening described, there being no other. It is certainly unwise to so plan the ventilating system of a large building as to make the inmates absolutely dependent upon the efficient working of a mechanical apparatus of this sort. Mechanical and other means of assisting "natural draft" are, nevertheless, valuable; and, in some instances, necessary accessories to a system of natural ventilation, especially for large buildings, as they furnish a means by which the disturbing influence of winds may be more or less completely overcome. The writer has had two large fans in use in buildings under his care for several years, as occasion has required. As usually constructed and employed, however, these appliances are almost useless from their inadequacy and inefficiency. This is especially the case when heat in the ventilating shaft is depended upon as a means of securing a strong draft, in consequence of the use of an amount of heating surface quite inadequate for the work required.

Ventilating shafts which are exposed on all sides, and even those which are placed in the outer walls of buildings must be heated or furnished with a fan to insure a constant draft. The amount of heating surface usually provided in such cases, is ridiculously small, and is not infrequently so placed as to be of very little value. When it is recalled that all the air supplied to a building must pass through the ventilating shaft, it will be apparent that a considerable amount of heat must be imparted to this air to produce a strong draft in case the chimney is so situated that the air loses a considerable amount of its heat before it is expelled from the chimney.

From experiments which have been made (Box) for the purpose of determining the heating capacity of steam pipes, we know that one square foot of surface of one-inch pipe (3 linear feet) will give off about 300 heat units per hour, or 5 heat units per minute under the conditions in which heating is required in a ventilating shaft. Five heat units will raise the temperature of 276 cubic feet of air 1° (1 cubic foot of air at 62° weighs .0761 lbs. The specific heat of air is .238. 5÷.0761.÷238=276). Knowing the amount of air to be transmitted by the ventilating shaft per minute or second, it is easy to determine the amount of heating surface required to raise the temperature of the air one one or more degrees. It is only necessary to divide the amount of air transmitted per minute by 276 to determine the number of square feet of heating surface required to raise the temperature of the given quantity of air 1° F.

Taking, for example, a case in which, as in our last illustration, the amount of air required to be transmitted is 32 cubic feet per second, or 1920 cubic feet of air per minute, we have 1920÷.276=6.95, practically 7 square feet of heating surface, or 21 linear feet of one-inch pipe, necessary to raise the temperature of the air 1° F. To raise the temperature of the air 5°, which would be quite sufficient to insure the successful working of the shaft, would of course require five times as much heating surface, or 105 linear feet of one-inch pipe.

The most economical method possible for heating a ventilating shaft is the combustion of fuel in the shaft itself. A number of years ago, in studying the ventilation of the House of Parliament in London, by the aid of the assistant engineer, who kindly conducted me through the subterranean region of this great structure, I was surprised to find that the current of air in the great towers, which are not merely architectural features but constitute the ventilating shafts of the building, was maintained by means of a great heap of burning coal, which was placed exactly in the center of the shaft upon a high platform, the top of which was at about the same level as the top of the great horizontal ventilating ducts which entered the shaft at its bottom.

Fuel may be consumed in a shaft by means of a stove placed in a chimney, carrying the stovepipe up through it. In exceptional cases the smoke may be discharged directly into the shaft; but this arrangement is not always a safe one and hence cannot be recommended. The position of the heater is a matter of no small importance. I have sometimes seen a steam coil placed at the extreme bottom of the ventilating shaft, the first opening being several feet above it. In so placing the heater, there is very little circulation of air, and hence its efficient heating capacity is not utilized. To secure the efficient working of a ventilating shaft, the heater should be placed above the highest opening. It is, as a rule, not wise to have openings into a ventilating shaft at different levels, but if this arrangement cannot be avoided, the heater should certainly be placed above the highest opening; or if a long heater, placed against the side of the chimney, it should extend above the highest opening. Whether the heat should be concentrated near the lower portion of the shaft, or should be extended some distance along the inside wall, is a question which may be differently answered according to circumstances. There is an advantage in the extension of the heater some distance along the inner wall in that a better opportunity is afforded for radiation, and thus for heating the inner surface of the shaft, and so preventing the tendency to downward currents. It should be remembered, however, that the higher in the shaft the heater is placed the shorter will be the heated column, and hence, from this standpoint, the less the efficiency of the heat employed.

In conclusion, the writer wishes to disavow any attempt to make, in the foregoing, an extensive presentation of the subject of ventilation. Those who wish to make an extended study of the subject will find the means of doing so in the excellent work of Mr. Thomas Box, published by E. and F. N. Spon, 12 Cortlandt street, New York City. My aim in the preparation of this paper has been to present such practical points as I have gathered from a somewhat extended experience in planning the ventilation of large buildings in which I have had an opportunity to live for a series of years, studying the result of various methods employed, and to formulate a few simple rules which are useful for the working out of correct methods of ventilation in all ordinary cases, and which are much less cumbersome for use than the ponderous formulæ of Box and others who have undertaken to present this subject in a scientific way. I ought, also, perhaps, to call attention to the fact that, while the physical principles relating to heating, ventilating, etc., are correctly given by Box and other authors who have given much scientific data upon this subject, the suggestions made with reference to the supply of fresh air are, as a rule, widely at variance with the conclusions at which Parke, Angus Smith, and other investigators have arrived in the study of the question of ventilation from a sanitary and hygienic standpoint, and so are not to be relied upon. For example, Box puts the amount of fresh air required for each person per hour at 212 cubic feet, which is simply ridiculous, being less than one-tenth the amount shown by ample experience to be really necessary.

THE HALF-MILLION CLUB.

WE would call the attention of the Half-Million Club to the importance of having our city properly lighted by gas and electricity during the full month, before inviting strangers from a distance to visit our city in order to gain a favorable impression of its advantages as a residence, or business headquarters.

The new rule of having the city left in the dark for eight nights each month will not favorably impress those from the east who are accustomed to see their streets well lighted at all proper times. If the city is too poor to pay for such accomodation, it had better go out of business at once. If it is good economy to be in the dark nearly one-third of the month, why not save the other two-thirds of the expense and have no light at all?

A GRAND BOULEVARD.

A magnificent boulevard fifty miles long, from San Jose to San Francisco is the latest improvement talked of; many of the leading citizens along the route are interesting themselves in having a macadamized driveway constructed. If this magnificent scheme is carried out, we see no reason why it should not be, it will make one of the finest drives we know of. Another encouraging feature of this promised driveway, is that it shows the city is awaking to the importance of making improvements and if the spirit of enterprise is allowed to develop itself it will lead to still more startling inovations, that may for a time make old fogies sick at heart, but in the end will put money in their pockets.

Pluck and enterprise cause benefits to fall upon the just and the unjust.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

SEVENING Building, Oakland, C. Mau, Architect.

PRELIMINARY Sketch of Residence at Saucelito, Narine County, Havens & Toepke, Architects.

CITY Hall, Alameda, Competitive Design, Second Prize, Edmund Kollofrath, Architect.

RESIDENCE at Bakersfield, Cal., Henry A. Schultze, Architect.

AS a matter of information we would state that the original building of the California Safe Deposit and Trust Company's Building was designed by Wm. Patton, Architect; the additions and alterations are by Henry A. Schulze, Architect.

GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

EUROPEAN FORESTRY WORK.

NEARLY all the nations of Europe are engaged at the present time in no controlling the forest supply that every bit of public and private property in trees is placed under restriction against destructive cutting. The forests are all so highly protected, says the *Boston Herald*, and even where no state control exists, the freedom in cutting trees which exists in this country is unknown.

In Germany during the last twenty-five years some 300,000 acres have been reforested, and the government has granted $300,000 in this way to private owners of waste land. In Austria, since 1852, a forest law, which exercises a strict supervision over the forests, both public and private, has been in existence, and no one is allowed to devastate a forest to the detriment of adjoining holders of land, and cleared or cut forest must be replanted within five years.

In Italy the effort is constant to increase the amount of wooded lands, and the government contributes three-fifths of the cost of reforestation, upon condition that the work is done according to its plan and instructions. In Switzerland the national government contributes from 30 to 70 per cent of the establishment of new forests, and from 20 to 50 per cent for the planting of protected forests, and the law is very strict in regard to cutting.

France is also deeply interested in public forest property. The forests belong largely to communities and public institutions, as well as to the state, and they are controlled in a manner similar to the regulation of forests in Germany. Here, as well as there, no clearing is allowed except by consent of the forest administration.

In all these countries the strictest attention is paid to the subject of forestry, and schools are everywhere maintained for the purpose of instructing men in this work. Russia has been the only nation where forests have been until lately under no restriction, but since 1888 even this country has had its forest laws, and offers loans on favorable terms for the protection and increase of the forests. Hardly any European nationality is without its state control of the forests or without the training schools in which men are instructed how to take care of them.

They are trying in Europe in every way possible to save the forests, and in the United States efforts are now being made in nearly every commonwealth to regulate and control the wooded lands, but our people are not ready to accept the stringent measures which have been empioyed as a necessity for preservation.

THE BUILDING THAT IS TO BE.

DESCRIPTION OF THE STRUCTURE DESIGNED FOR THE SITE AT SEVENTH AND MISSION STREETS.

THE acting Supervising Architect of the Treasury has at last secured the approval of the plans for the proposed new p ostoffice building for San Francisco. The following is the official description of the building as furnished to the *Examiner* by Mr. Hamilton, the Civil Engineer, who has charge of the drafting room of the Supervising Architect's office.

The main dimensions of the building will be 250 by 215 feet, a height of 70 feet in the main, 90 feet at the main entrance, which will be on Seventh street. This main entrance will project 20 feet from the main building and there will be pavilions on the corners and in the center of the other facades 12½ feet each, making dimensions for Seventh street to the rear 270 feet, and from Mission to Stevenson street 240 feet. The building is to be three stories in height in the main and five stories over the center pavilion on Seventh street.

IN RENAISSANCE STYLE.

The design is what is known as Renaissance, with pavilions on each corner and in centers of facades. The main entrance will be fifty feet wide, divided into three arched doorways. The other entrances will be forty feet wide and will also have three arched doorways with carved pediments over them and in the rear, with tympanums of appropriate designs. The pavilion in the center of each facade will be flanked with columns and pilasters, and the whole building will be crowned with a balustrade. There will be a group of statuary over each center pavilion. The building will be constructed of either granite or marble, which has not yet been determined.

The first story will be set apart for the use of the San Francisco Postoffice. In the center will be a clear space 200 feet square for the use of carriers and other employees engageed in the reception and distribution of mails, and in alcoves there will be rooms for the Postmaster, Assistant Postmaster, and money order and registry offices. This story will be eighteen feet in height.

In the second story there will be three rooms set apart for United States Courts, one each for the Circuit Court, District Court and Federal Court of Appeals. These rooms will by 50x30 feet in size. On this floor there will also be rooms for judges, attorneys and other officials of the courts, jury-rooms and library. This story will be fifteen feet in height.

The third story has been designed with a view of accommodating the Railway Mail Service, Signal Service and Pension Agent. There will be rooms for railway mail clerks, Superintendent of Railway Mail Service, Postoffice Inspectors, a dormitory for mail clerks when off duty, offices of the Signal Service, United States Pension Agent and his clerks and miscellaneous offices for Federal officials. This story, as well as the fourth and fifth, will be thirteen feet in height. In the basement will be located machinery for operating the heating and ventilating apparatus. Here will also be a large space for storage.

PLENTY OF LIGHT.

It is proposed to have plenty of light and ventilation for people employed in the building. All corridors above the first floor will look out upon a court 153x120 feet. This

court will leave a clear space above the postal clerks employed on the first floor, so that there will be no lack of natural light at any time. The ventilating apparatus will also be of the latest improved kind, and there will be four ventilating flues to carry off foul air.

The offices on all floors above the basement will open upon the street. Thus each will be will supplied with light and air. There will be four elevators, two each at the Seventh-street and Mission street entrances. A peculiar feature of th postoffice buildings recently planned is that lookout stations are provided on top of the postoffice safes which are to be built on the first floor. Inspector will have entry by a circular shaft in the basement, which by means of a spiral stairway will enable them to mount to the top of those safes located in different parts of the floor and overlook all the operations of the postal clerks.

ONE MORE MOVE.

The House Committee on Appropriations wrestled for some time to-day with the San Francisco public-building imbroglio. Representives Loud and Maguire were present at the request of the committee and the question was discussed in all its phases. After quite a lengthy wrangle the committee reached a decision. There will be added to the appropriation already available for the building only $50,000, instead of $150,000, as Secretary Carlisle first recommended. This appropriation will be incorporated in the Sundry Civil bill. There will also be further delay in begining work, on account of the decision of the committee that an investigation must be made to determine whether it is safe to erect on the site selected.

The first surprise at to-day's meeting came when it was announced that Secretary Carlisle has revised his first estimate for the appropriation, and requested of the Appropriations Committee only $50,000 in addition to about $190,000 left over from the purchase of the site. When this matter was brought up before the committee, both Representatives Maguire and Loud vigorously protested against this small appropriation for beginning so large a building, but Chairman Sayers was firm, and refused to allow any more than the Treasury Department had requested. Then the San Francisco Representatives conceded that it was a wise course that this appropriation be made a contingent one, and only available after thorough examination of the site has been by United States Army Engineers.

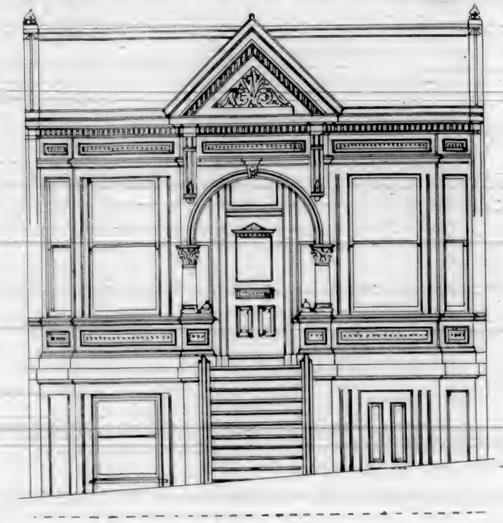
A CASTLE ON TWIN PEAKS.

E. AVERY McCarthy, secretary of the Stanford Addition Land Company, is authority for the statement that a rich English friend is negotiating for the purchase of the Twin Peaks and about thirty-five acres of the adjoining land for the purpose of erecting a handsome residence, built after the style of the old English baronial castles. The site is a perfect one for such a purpose, as it commands a view which cannot be equaled in variety and extent. From the rugged outlines of Marin County to far down among the San Mateo hills, and from the horizon out on the ocean to the mountains back of Oakland, there is nothing which does not come within view from the Twin Peaks.

Perched upon the top of the peaks a large building such as would be put there would stand like a sentinel over Market street, for that thoroughfare would lead right up to its doorstep should it ever be carried out so far. Senator Stanford at one time signified an intention of securing the property for the city, to be used as a public park, but it was sold to others and finally came into the hands of Mr. McCarthy's family.—*Call.*

BOOKS AND PERIODICALS.

MODERN OPERA HOUSES AND THEATRES. Examples selected from playhouses recently erected in Europe, with a short descriptive text and a treatise on theatre planning and construction, with supplements on stage machinery,



FRONT ELEVATION.

theatre fires and protective legislation. By Edwin O. Sachs, Architect, F. S. S., and Ernest A. E. Woodrow, Architect, A. R. I. B. A. Preparing for publication. Illustrated by a Series of 220 plates, reproduced in the best manner by Photo-lithography, from line drawings specially prepared for the Work, and some hundreds of diagrams in the text, reproduced from original working drawings, with all plans and sections drawn to a uniform scale.

The work will be in three volumes, size 23 by 16 inches (58 by 40 cm.), strongly and suitably bound in buckram.

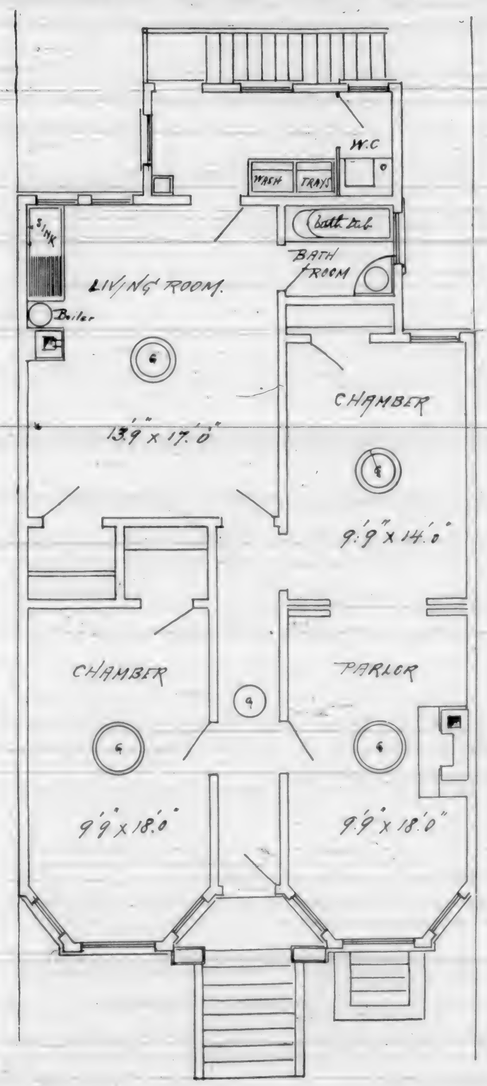
Upon publication the price of the work will be £15 15s., but for the *Subscribers, on whose support the issue entirely depends, the charge will be £9 9s. net.* Half the subscription price will be payable on the issue of the first volume, and the remainder on the completion of the work. A List of Subscribers will be printed in each volume. The first 150 Subscribers will receive numbered copies with a distinguishing title page.

LIPPINCOTT'S MAGAZINE for April, 1895. The complete novel in the April issue of Lippincott's is "Alain of Halfdene," by Anna Robeson Brown. It is a stirring tale of the sea, pirates, rescuers and Mt. Desert (then by no means so well known as now), in the days when Washington was President.

"At the Hop-Pole Inn," by Mrs. Poultney Bigelow, tells how curiously a nearsighted Englishman and his young wife were reconciled after a first quarrel. "The Defendant Speaks" to some purpose in a story by Genie H. Rosenfeld; result, a divorce is avoided.

Mary Dawson relates the innocent loves of a dancer, 'The Butterfly," and her young man. Marjorie Richardson shows how the young woman who occupied "The House with the Paint Worn off" procured its external rehabilitation.

THE ENGINEERING REVIEW edited by J. Stevens Jeans, London, England, can be truly called the "Epitome of the World's Current Literature". The American agency



of this ably conducted monthly magazine is at 12 Cortlandt street, New York, conducted by Messrs. Spon & Chamberlain. American subscription $1.75 per annum.

An illustrated description of a visit to the works of Messrs. Charles Cammell & Co., Limited, Sheffield, England, gives a very vivid account of these immense works for the manufacture of steel and iron as well as the various application of these metals in the way of heavy ordnance, forged cylinders, steel nails, armor plates, etc.

The late Mr. Charles Cammell was the founder of this company in 1837, who in partnership with Mr. Thomas Johnson commenced as steel and file manufacturers and merchants. The demand for their steel proved so great that from time to time enlargements in their works have been made, until at the present time it includes mines of coal and iron ore, and every appliance of turning out the immense production full tables of which will be found in this very interesting article.

We were pleased to notice that the editor gives many notices of recent works of engineering in this country. The article entitled "Recent Progress of Electrical Engineering" by Major T. Flood Page will be read with interest by the Electric Engineers of this country.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Tenant's Remedy for Breach of Agreement by Landlord.—Where a landlord agreed to make improvements for the benefit of the tenant, his failure to make them does not relieve the tenant in possession from liability to pay rent. And, in such case the tenant is entitled to damages, the measure of which is the difference between the rental value of the premises without the improvements and their rental value with the improvements.

Long v. Gieriet, Supreme Court of Minnesota, 59 N. W. Rep. 194.

Action for Balance on Contract for Work and Labor.—Where no time is fixed for the completion of work under a contract in an action thereon for a balance due, the party for whom the work is being done is not entitled to credit for wages voluntarily paid, in the absence of the contractor to another, to do part of the work he had contracted to do.

Wagner v. Jennings, Court of Civil, Appeals of Texas, 27 S. W. Rep. 888.

Effect of Destruction of Building as to Mechanics' Lein.—Under the statutes, giving a contractor who performs labor or furnishes materials in the construction of a building "a lien thereupon, and upon the interest of the owner of such building in and to the land on which the same is situated," and extending the right to subcontractors, neither a contractor nor a subcontractor has any lien for materials or labor when the building is destroyed before completion.

Goodman v. Baerlocher, Supreme Court of Wisconsin, 60 N. W. Rep. 415.

Right to Mechanics' Lien on Theatrical Scenery.—Scenery and other articles constituting the stage and scenic outfit of an opera house are part and parcel of the edifice, as such, they being essential to the completeness of a building of that class. This being so, the furnishing of such outfit, or of the materials composing same, is furnishing materials for the improvement of real estate; and the person by whom said furnishing is done is entitled to a lien upon the opera house and premises, under the provisions of the statutes giving mechanic liens.

Waycross Opera House Co. v. Soseman, Supreme Court of Ga., 20 S. E. Rep. 252.

Liability for Dangerous Premises.—By contract with an elevator company a party agreed to put fire extinguishers in its elevator. The elevator company was to furnish the staging for the men employed to put in the apparatus. One of these men while at work was killed by a fall caused by a defective plank in the staging. The evidence showed that there was a knot in the plank, and the deceased could not possible have seen it, by reason of the darkness. It was held by the Supreme Court of Wisconsin, that the workman was not guilty of contributory negligence, and that the elevator company was liable by reason of its contract to put in the staging, although the contract was not made with him.

Bright v. Barnett & Record Co. 60 N. W. Reporter, 418.

BUSINESS MOSAICS.

What house is complete without some decoration? Samuel Kellett manufacturer of plaster decorations, plastering repaired and whitened. 28 Ellis street, San Francisco; 375 Twelfth street, Oakland.

"Were you ever up before me?" asked a Police Judge. "Shure I don't know, yer anner. What time does yer anner get up?"—*Boston Commercial Bulletin.*

W. H. Wickersham, as we have had occasion previously to remark is a Building Contractor at 1125 York street, San Francisco, whom if you once employ, is sure to give such satisfaction that he is again called for when more work in his line is wanted, this we consider the highest kind of recommendation.

"Why do you punch that hole in my ticket?" asked a little man of the railroad conductor. "So you can pass through," was the reply.—*Boston Commercial Bulletin.*

If you need water only when the wind blows; if you are satisfied to utilize but a small fraction of the water in your well; if you prefer heavy bills for repairs after each storm in winter, by all means use a windmill; but if you want water at any time, and up to the full capacity of your well, put in the Ajax Coal Oil Gas Engine, the latest thing in mechanics, an engine that uses common coal oil for fuel, and is built by the well known firm of Palmer & Rey, San Francisco, Cal.

Labor Agitator—"Every man is the architect of his own fortune." Murphy (from the rear of the hall)—"Yis, that's so, but he stands a mighty poor chance when he has nothing but a shovel or hod to draw his plans wid."—*Ex.*

Architectural and Ornamental Iron Work. Stable fixtures, hay racks, feed boxes, stable guards, harness fixtures, etc. Now that horses are so cheap is a good time to fix over your stable; of late years much attention has been paid to having the horse housed in a proper manner, and if the rage continues the stable is likely to out do the parlor, unless the madam put her foot down. 135–145 Fremont street, San Francisco, is the headquarters of the Vulcan Iron Works.

"Highstep seems very blue since Miss Coins threw him over." "Yes; he's heartbroken to think what an excellent husband she has missed."—*Chicago Inter-Ocean.*

Miss Peart—"Do you think one is liable to catch anything from kissing?" Mrs. Placid—"That's the way I caught my husband."—*Ex.*

Clawson's Patent Chimney's generally considered the most complete and safest in the market, can be found at 1340 Market street, San Francisco.

"Here's a lovely cigar I picked out for you." "Thanks, but give me one you bought for yourself."—*Humoristische Blatter.*

Wm. Bateman manufacturer of wood mantles, interior finish, inlaid floors, banks, offices, stores and steamboats fitted up. If in want of any of this kind of work you have only to call upon Mr. Bateman at 411 Mission street, who will soon convince you that your wants can be supplied at his establishment.

The antique Roman who fell on his sword made a much better historical figure than the modern militiaman who tripped with the same weapon twisted between his legs.—*Puck.*

Proper Lubricant for Cycle Chains.—It is conceded by all wheelmen that some lubricant is needed to prevent wear of chain and sprocket wheel; such a lubricant not only prevents wear but very largely increases speed and ease of driving. Oil or grease, while useful for the moment, catches and holds dust and dirt. After much experimenting it has been found that graphite makes the most perfect lubricant, when the right kind is used and properly prepared.

The word graphite, like the word charity, covers a multitude of sins. Under the name graphite lubricant are found compounds of cheap black-lead, stove polish, foundry facings, soapstone, etc. Safety in buying, and the surety of getting the best graphite lubricant made, lie in purchasing of a firm of world wide reputation and long experience. Such a firm is the Joseph Dixon Crucible Company, of Jersey City, N. J.

He—"Oh, yes, when I was in London I was enthusiastically received in Court circles." She—"What was the charge against you?"—*Pick-me-up.*

Tin Roofers on the Coast will be glad to notice by our columns in the present issue that the old house of N. & G. Taylor Co., Tinplate Manufacturers, Philadelphia, now carry a large stock of their world wide celebrated brand of Roofing Tin, The Taylor "Old Style" at San Jose, in charge of the well-known house of Messrs. John Stock Sons. This firm announce that they are now ready to supply all dealers and consumers, with either prices, samples or general information as to the merits of the goods.

The Taylor "Old Style" has been largely used in the past throughout California, and also in Oregon and Washington. It is now being used on the Grand Central Station on the Northern Pacific R. R. at Portland. It is handled for the North West as a distributing point by Messrs. Goldsmith & Loewenberg, Portland, Oregon. Thousands upon thousands of buildings all over the United States are lasting testimonials of the worth and great durability of this, the original and genuine "Old Style" brand of Roofing Tin, its many imitations have made the "Genuine" almost a household word among the roofing fraternity. To our readers it should be borne in mind that it is made in the same way as Roofing Tin was first made in 1830, over 65 years ago, in Philadelphia, and then handled by Messrs. N. & G. Taylor Co., and as the firm states, "There are roofs East covered with this brand of Tin that are just as good to-day as when first put on nearly 70 year ago." The wear is certainly the true test of value.

Architects in naming the brand in their specifications can run no risk of substitutes or "just as good". The brand can be obtained quickly from Messrs Jno. Stock & Sons, each sheet is stamped with the name of the brand, the thickness, and the name of N. & G. Taylor Co. who warrant the tin, and it is the only tin on the market that is warranted in the sense demanded by the user. We compliment the Messrs. Taylor on the step they have taken, and congratulate Roofers on the advantage they thus secure.

CITY BUILDING NEWS.

Baker near Greenwich. To build; owner, Mrs. T. M. Sheilds; contractor, Jacob Schuler; signed, April 5; filed, April 8; cost $2200.

Beaver street, No. 15. Additions; owner, Mrs. F. Loth; contractor, C. Eriksen; signed, March 23. filed, April 3; cost $2000.

Butchers Reservation, lot 3, block 22. Cold storageplant; owner, Henry Miller; architect, H. F. Spencer; contractor, Cyclops Iron Works and Gurney Refrigator Co.; signed, March 29; filed, April 3; cost $22,000.

Broadway near Stockton. Mason and terra cotta work; owner, V. Pucinelli; architect, E. Deplerre; contractor, P. A. Anotonelli; signed, March 14; filed, March 14; cost $2750.

California and Montgomery. Steam heating; owner, Cal. Safe Deposit and Trust Co.; architect, H. A. Shulze; contractor, P. Leprohon; signed, March 6; filed, March 15; cost $4235.

California and Montgomery. Electric Lighting, etc.; owner, Cal. Safe Deposit and Trust Co.; architect, H. A. Schulze; contractors, Will & Finck Co.; signed, March 6; filed, March 15; cost 3592.

California and Montgomery. Plumbing, gas fitting, etc.; owner, Cal. Safe Deposit and Trust Co.; architect. H. A. Schulze; contractor, James Duffey; signed, March 6; filed, March 15; cost $16,954.

California and Montgomery. Carpenter work and the addition of two stories; owner, Cal. Safe Deposit and Trust Co.; architect, H. A. Schulze; contractor, Thomas Day & Sons; signed, March 6; filed, March 15; cost $35,400.

California and Jones. Ornamental Iron Work; owner, Nob Hill Development Co.; architects, Bugbee & Gash; contractor, D. Jordan; signed, March 18; filed, April 4; cost $4550.

California and Jones. Anchors beams, etc.; owner, Nob Hill Development Co.; architects, Bugbee & Gash; contractor, Dennis Jordan; signed, March 18; filed, March 19; cost $20,600.

California and Jones. Plumbing, gas fitting, etc.; owner, Nob Hill Development Co.; architects, Bugbee & Gash; sub-contractor, J. Doherty; signed, March 13; filed, March 20; cost $10,990.

California and Jones. Electric Elevators; owner, Nob Hill Development Co.; architects, Bugbee & Gash; contractor, Frank A. Hall; signed, March 18; filed, April 4; cost $7,000.

California near Heyman. To build; owner, Mr. Lindberg; contractor, J. Gillogley; cost $1600.

Castro near 19th. Two flats and coal yard, except plumbing; owner, Edward Ring; contractor, Thomas McKee; signed, March 3; filed, March 13; cost $2025.

Carl near Stanyan. To build; owner, A. M. Bruiscber and wife; architect, J. T. Kidd; contractor, W. A. Muller; signed, April 2; filed, April 3; cost $1460.

Central Ave. near Clay. To build; owner, W. R. Van Alen; architects, McDougall & Son; days work; cost $5000.

Clement street and 4th Ave. Three two-story frame residences; owner, D. F. McGraw; architect, C. F. Robinson; cost $9000.

Clementina near 4th. To build; owner, Chas. Giovanetti; architect, C. R. Wilson; contractors, Cuneo & Cavaglia; signed, April 8; filed, April 8; cost $3750.

Chattanoga near 23d. Alterations and additions; owner, Samuel Hortop; contractor, D. Currie; signed; March 16; filed, March 19; cost $2400.

Clay near East. Driving 316 piles; owner, J. D. Montanya; architects, Percy & Hamilton, contractor, S. F. Bridge Co.; signed March. 14; filed, March 15 cost $4218.60.

Church near 21st. To build; owner, R. M. Barry; architects, Mahoney & Ryland; contractor, T. E. Corrigan; signed, March 13; filed, March 19; cost $2595.

Clayton near Frederick. To build; owner, Mary O'Leary; architects, Shea & Shea; contractor, James Mooney; signed, March 12; filed, March 15; cost $2898.

Collins near Pt. Lobos Ave. To build; owner, J. McMahan; contractor, J. D. Barton; cost $1600.

Dolores near 22d. Raising old building and additions; owner, Samuel Mathews, Jr.; contractor, W. P. Smith; signed, March 18; filed, March 18; cost $640.

Duncan near Guerrero. To build; owner, Kate Marron; architect, J. T. Welsh; contractor, P. R. Bassett; signed, April 3; filed, April 8; cost $2250.

Dupont near Francisco. To build; owner, J. Kucich; architects, Salfield & Kohlberg; contractor, John Pecavich; signed, March 19; filed, March 20; cost $2230.

Eddy near Buchanan. To build; owner, Simon H. Bush; contractor, C. W. Depew; cost $5000.

Elizabeth near Noe. Raising building; owner, M. J. Fitzgerald; contractor; Wm. Plant; signed, March 15; filed, March 19; cost $1065.

Elizabeth near Noe. To build; owner, R. P. Thompson; contractor, W. W. Rednell; signed, April 2; filed, April 9; cost $1600.

Fell near Gough. To build; owners, Mrs. Mary F. and George F. Kelly; contractors, Wheeler & Perry; signed, March 27; filed, March 28; cost $4800.

Francis near Mission. To build; owner, James and Delio Rice; contractor, P. H. McKenna; signed, April 1; filed April 1; cost $800.

Folsom near 20th. To build; owner, J. H. Robinson; contractor, H. J. Weiss; signed, March 23; filed, April 2; cost $3313.

Folsom near 21st. To build; owner, Jacob Rohrer; architect, Emil John; contractor, H. T. Grieb; signed, March 28; filed, April 2; cost $2900.

Fourteenth and Howard. Alterations and additions; owner, Maria L. Rerrel; architects, Pissis & Moore; contractor, F. W. Kern; signed, March 19; filed, April 3; cost $6350.

Filbert near Dupont. To build; owner, Pietro Queirolo; contractors, Cuneo & Cavaglia; signed, March 21; filed, March 26; cost $6000.

Fillmore near Washington. Alterations; owner, Mrs. R. Greenfield; contractor, G. G. Gillespie; signed, March 27; filed, March 27; cost $3000.

Fifteenth Ave. near Point Lobos. To build; owner, E. G. Flanders; contractor, W. W. Redmill; signed, March 19; filed, March 23. cost $1350.

Fulton near Baker. To build; owner, Hannah Mahoney; contractor, J. C. Kelly; signed, March 21; filed, March 23; cost $2360.

Fulton near Baker. To build; owner and builder, Thomas Volden; cost $6000.

Franklin and California. To build; owner, Edward Coleman; architect, W. H. Lillie; contractors, Farrell & Bell; signed, March 18; filed, March 19; cost $13,640.

Geary near Leavenworth. To build; owner, Dr. C. D. Cleveland; superintendent, J. W. Blundon; days work; cost $3500.

Green and Taylor. To build; owner, Thomas McCarthy; contractor, A. E. Waller; signed, March 16; filed, March 19; cost $5300.

Grant Ave. and Sutter. Two-story brick; owner, J. W. Tamm; architect, A. J. Barnett; contractor, A. G. Johnson; signed, April 5; filed, April 6; cost $4000.

Hayes and Octavia. Plumbing; owner, Mrs. Reinle; architects, Stone & Cahill; contractor, J. Doherty; cost $960.

Hattie and 17th. To build; owner, Jas. Kelly and wife; architects, McDougall & Son; contractors, Brennan Bros.; signed, March 28; filed, March 28; cost $1740.

Hermann near Steiner. To build; owner, Chas. Huber; architects, Mahoney & Ryland; contractor, Geo. Reichley; signed, March 30; filed, April 3; cost $1989.

Jasper Place near Filbert. To build; owner, A. Cahri; architects, Townsend & Wyneken; contractors, Cuneo & Cavaglia; signed, March 21; filed, March 23; cost $1450.

Jessie near 2d. Five stories and basement, brick; owner, D. Keil; superintendents, Hansbrough Bros.; days work; cost $15,000.

Jessie near 7th. Additions; owner, Michael McNamara; architects, Hatherton & Ross; contractor, J. W. Sandy; signed, March 20; filed, April 3; cost $1250.

Jersey near Noe. To build; owner, Laura H. Wells; architect, Frank Mead; contractor, W. H. Mead; signed, March 27; filed, April 10; cost $1950.

Jones near Chestnut. To build; owners, Mr. and Mrs. David Crowley; contractor, J. W. Pauls; signed, April 6; filed, April 10; cost $3600.

Jones near Post. Berkshire Hotel plumbing; owner, Emily B. Hopkins; architect, J. H. Littlefield; contractor, H. Williamson; signed, March 27; filed, March 28; cost $2750.

Jones near Post. Alterations and repairs; owner, Mrs. Emily B. Hopkins architect, J. H. Littlefield; contractor, D. Currie; signed, March 30; filed, April 1; cost $1200.

Kentucky near Sierra. To build; owner, Catherine Sullivan; architect, A. J. Barnett; contractor, Timothy Sullivan; signed, March 14; filed, March 18; cost $2900.

Laguna near Vallejo. To build; owner, Caroline S. Townsend, architect, W. H. Wharff; contractor, F. W. Maurice; signed, March 14; filed, March 15; cost $11,230.

Laguna near Vallejo. Plumbing and gas-fitting; owner, Caroline S. Townsend architect, W. H. Wharff; contractor G. C. Sweeny; signed, March 28; filed, March 30; cost $1240.

Laguna near Pine. Alterations and additions; owner, Z. Wollberg; architect, H. Geilfuss; contractors, Hood & Watson; cost $1900.

Lafayette Place near Green. To build; owner, G. Gardella and wife Giovanni; contractors, B. Pagano and G. Capelli; signed, March 25; filed, March 25; cost $3194.

Liberty near Guerrero. To build; owner, W. J. Patterson; architects, Martens & Coffey; contractor, H. Behrens; signed, March 26; filed, March 28; cost, $2441.

Liberty near Guerrero. Concrete, Grading, etc.; owner, W. J. Patterson; architects, Martens & Coffey; contractor, Cushing Welmore Co.; signed, March 25; filed, March 28; cost $895.

Lyon near Fulton. To build; owner, K. C. Richard; contractor, Wm. Harvard; signed, March 25; filed, March 25; cost $3250.

Market street, No. 1318. Alterations and repairs; owners, Dunn Bros.; architect, J. W. Rowell; contractor, W. H. Hughes; signed, March 16; filed, March 16; cost $1348.

Market and O'Farrell. Alterations to entrance, Phelan Building; owner, Phelan Estate; architect, Wm. Curlett; cost $6000.

Market near 5th. Mason work on Parrott Building; owners, Parrott Estate; architects, Pisses & Moore; contractors, Richardson & Gale; Estimated cost $76,156.

Market near 5th. Cast iron casing for steel columns; owner, Miss Emma Spreckles; architects, Reid Bros.; contractor, Bay City Iron Works; signed, Feb. 26; filed, March 28; cost $1235.

Market near 5th. Marble work; owner, Miss Emma Spreckles; architects, Reid Bros.; contractor, Vermont Marble Co.; filed, March 28; filed, March 28; cost $3600.

Market near 5th. Finishing a bar room; owner, Chas A. Zinkand; architect, Emil John; contractors, Fink & Schindler; signed, April 2; filed, April 4; cost $11,256.

Market and 4th. Elevator alterations; owner, Mrs. Flood; contractors, Cahill & Hall; cost about $25,000.

Mason near Green. Six dwellings complete; owner, A. J. Garibaldi; architect, E. Depierre; contractor, Jas. McLean; signed, April 1; filed, April 8; cost $6150.

Mason near Geary. Plumbing, etc.; owner, Hall Association N. S. G. W.; architect, A. C. Lutgens; contractors, Allen & Rooney; signed, March 30; filed, April 2; cost $2790.

McAllister near Baker. To build; owner, Thomas J. Campbell; architect, J. B. Campbell; contractor, James McConahey; signed, March 28; filed, April 12; cost $2700.

Montgomery near Vallejo. To build; owner, G. Capura; architect, E. Depierre; contractor, Jas. McLean; signed, March 9; filed, March 12; cost $2345.

Mission near 7th. To build; owner, O. Nolte; architect, C. M. Rousseau; contractor, R. J. Pavert; signed, March 19; filed, March 21; cost $4000.

Octavia and O'Farrell. To build; owner, Hannah Maurer; architect, E. J. Vogel; contractor, M. J. Savage; signed, April 1; filed, April 2; cost $9140.

Ocean House Road. Excavations and embankment for a race track; owner, Alexander F. Williams; Engineer, M. M. O'Shaughnessy; contractors, P. Broderick and J. Kelso; estimated cost $25,000.

Pacific Ave. near Jones. To build; owner, John and Annie Wrede; architect, F. B. Wood; contractor, Robert Frost; signed, March 12; filed, March 13; cost $2475.

Presido. Pneumatic Gun Power House; owner, U. S. Government; architects, Percy & Hamilton; contractors, Francoeur & Bowers; cost $4200.

Post near Pierce. To build except plumbing; owner, Wm. Kaiser; architects, Salfield & Kohlberg; contractor, T. R. Bassett; signed, March 12; filed, March 14; cost $5600.

Post near Pierce. Plumbing; owner, Wm. Kaiser; architects, Salfield & Kohlberg; contractor, W. D. Hobro; signed, March 12; filed, March 14; cost $1125.

Polk and Sutter. Plumbing, etc.; owner, M. H. DeYoung; architect, Clinton Day; contractor, E. J. Duffey; signed, March 7; filed, March 27; cost $4000.

Ridley near Valencia. To build; owners, Galland Bros. & Caro; architect, M. J. Lyon; contractor, J. N. Cobura; signed, March 13; filed, March 16; cost $875.

Sacramento near Walnut. To build; owner, Felix Latz; contractor, F. G. Kronnick; signed, March 14; filed, March 14; cost $4000.

Sanchez and 19th. Additions; owners, Mr. and Mrs. Carmile; contractors, Hood & Watson; cost $900.

Second Ave. near Clement. To build; owner, Mrs. Adline Froham; architect, Herman Kraetzer; contractor, B. I. Taylor; signed, March 21; filed, March 25; cost $2500.

Second Ave. near Lake. To build; owner, T. G. Barker; architect, H. J. Kraetzer; contractor, Byron I. Taylor; signed, April 5; filed, April 10; cost $2500.

Seventh Ave. near A. Cottage; owner, J. C. Shea; architects, Shea & Shea; contractor, Jos. Keaney; signed, March 25; filed, March 28; cost $1100.

Shotwell near 24th. To build; owner, Samuel G. Hammond; architect, E. N. Snell; contractor, C. S. Emmons; signed, March 12; filed, March 12; cost $3363.

Sharon near 18th. To build; owner, Mrs. HuldaHeine; contractor, C. V. Bunce; signed, March 16; filed, March 22; cost $1800.

Stockton near Filbert. To build; owner, V. Podesta; architects, Townsend & Wyneken; contractor, G. Massoletti; signed, March 27; filed, March 28; cost $1425.

Steiner near Hayes. Plans and specifications filed; owner, Anna Cornahrens; architect, Henry Geilfuss; contractor, J. H. Munster; signed, April 6; filed, April 8; cost $4196.

Sutter near Central Ave. To build; owner, Miss Rebecca E. Mathews; architect, C. F. Robertson; contractor, Thomas J. Crawford; signed, March 8; filed, March 16; cost $2300.

Sutter near Powell. Alterations to Elsmere House; architect, Wm. Curlett; cost $3000.

Third street No. 44. Painting, glazing, etc.; owners, Hyman Bros. Co.; architects, Percy & Hamilton; contractors, Merchant & Nickles; signed, April 5; filed, April 8; cost $1500.

Turk near Larkin. Additions; owner, Geo. Scott; contractor, G. A. Hunnewell; signed, March 20; filed, March 20; cost $1200.

Turk and Fillmore. Car House; contractor, Wm. A. Butler; cost $28,000.

Twenty-fourth near Bryant. To build; owner, C. H. Dolan; architect, M. J Welsh; contractor, W. G. Hughes; signed, March 16; filed, March 16; cost $1348

Valencia near 16th. To build; owner, W. A. Bahr; architect, Emil John; contractor, F. A. Hellmuth; signed; March 14; filed, March 15; cost $2585.

Valencia and 15th. Excavations, etc.; owner, Rose A. Pickering; architects, Havens & Toepke; contractors, Whittle & Smith; signed, March 16; filed, March 22; cost $1891.

Van Ness Ave. near Vallejo. To build; owner, John Evans; architect, J. P. Chadwick; contractors, Wm. Smith & Thomas Rindell; signed, March 15 filed, March 8; cost $3675.

Vallejo near Buchanan. To build; owner, Thomas F. Boyle; architect, J. C. Newsom; contractor, Jas. McLean; signed, March 28; filed, March 30; cost $4647.

Vermont near Nevada. To build; owner, Isaiah Leslie; contractors Holmgren & Westerlund; signed, March 30; filed, April 2; cost $1200.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

IF late a great many accusations have been made of inferior workmanship being done in the construction of the foundations destined to carry the superstructure of the new ferry depot, which the State Board of Harbor Commissioners are erecting at the foot of Market street. The daily press have taken the matter up and redoubled the noise made by the accusers, till a disinterested public would be justified in believing it dangerous to even walk across the concrete arches and piers already completed. From the Governor of the State down through the Grand Jury and investigating committees and experts of all kinds, the foundations have been bored and tapped and tested, with the result that the more they are investigated the better they prove to be, and not a single serious charge against the contractors or the engineer in charge has been made to stick. But as a scape-grace must be found, it is now charged that the architect did not make a sufficient number of personal visits of inspection, and our worthy watch-dogs of the treasury will try to avoid any further payment of the architect's commission on that ground.

There is no doubt that the architect would have been held responsible in case the foundations had been found defective; it is a poor rule that will not work both ways; if the architect is responsible for the proper execution of the work, and would be blamed if things went wrong, why in the name of Justice is he not entitled to some credit when praise of the ferry foundations is the order of the day.

WHAT THE STATE OF MASSACHUSETTS HAS DONE IN REGARD TO GOOD ROADS.

STARTING in June, 1892, a Temporary Commission was appointed to examine into the condition of the roads, and to draft a bill providing for the improvement of the highways of the Commonwealth. The law suggested by the Commission was, with some changes, passed in June, 1893, but, before any petitions for construction of State highways were submitted to the General Court, an act was introduced and passed June 20, 1894, increasing the powers of the Commission, and permitting the Selectmen of any town, or the Mayor and Aldermen of any city, as well as County Commissioners, to petition the Highway Commission for taking roads as State highways. In place of submitting to the Legislature a separate bill for the construction of each road, it was voted that the appropriation be used by the Highway Commission, without further legislation, in building State highways.

The $300,000 has been pretty evenly divided among fourteen counties. Before deciding which of the many petitions should be granted an official visit was paid to each locality, and full information as to the value of the proposed improvement collected. While this method has distributed the work in small sections of roads, thus increasing the expense per mile, the advantage to the people at large will be greater, for the reason that each portion of the State highway constructed is intended to be an object lesson to those living near by. County Commissioners and other officials will watch the work as it progresses, and follow out the same lines in building county and other roads which are not intended for State highways.

The plan is to build, section by section, such roads as will connect the great centers of trade, and join with through roads in other States, so that both local and interstate communication will be benefited. Under date of January, 1895, the Massachusetts Highway Commission has rendered a report which covers the work of the past year, and this publication should be consulted by those who are considering legislation.

The provisions of our law will permit contracts for the construction to be let to municipalities or to private corporations, but the former arrangement is preferred, as it is more effectual in teaching the people the art of road building, and protects the State against cheapening the work by the importation of foreign laborers, an element which is apt to be objectionable.

A resident engineer is appointed by the Commission, and it is his duty to be in attendance, and keep a correct account of all items to be paid for by the State.

Wherever the traffic was of sufficient proportions to warrant it the roads have been broadened. The advantage to owners derived from the construction of the way is, as a rule, so much greater than the injury to them by widening the road that, in a large majority of cases, the town officials have been able to procure releases without any cost.

Thirty-eight sections have been contracted for, and only eight of them are to have a width of eighteen feet of hardened surface, all others being fifteen feet wide. As the primary object is to get length of way, the Commissioners are considering the advisability of building single-track roads in the thinly-settled districts. These would not be over nine feet wide, with here and there portions of double width as convenient passing points for carriages. A mile and a half of such roads can be built for less than the cost of a mile of fifteen feet width, and the advantage in getting produce to market is not lessened, provided such construction is confined to localities where the average traffic is from six to eight vehicles an hour.

There is need of legislation to regulate the care of, and responsibility for, sidewalks on State highways. These being of purely local advantage should be under the supervision of the town, the wheelways alone being constructed and kept in order by the State.

Progress has been made in the laboratory work on the road building stones of the State. Experiments of this kind are carried on at Harvard University in the Lawrence Scientific School, whose dean, Prof. N. S. Shaler, is a member of the Highway Commission. The chief aim of these inquiries has been to determine the qualities which constitute fitness for road making. This will be of value to the Commission in enabling them to utilize the road material near at hand, and thus lessen the cost of construction. As this phase of the work progresses maps are made showing the location of all deposits suitable for road building.

A number of towns have already appropriated money to build their streets in the same careful manner as those constructed by the State, and others have purchased road machinery with the intention of extending the work on roads other than State highways.

Careful consideration has been given to the plan of planting shade trees along the highways. With this end in view, experts have been consulted concerning the best varieties for the purpose, and the wayside trees have been examined, so as to determine the species well adapted to the climate and soil of Massachusetts.

As the estimated expense of procuring and planting these trees is not less than one-half a million dollars, the Commission has rightly made this question secondary to road building, but in the meantime they are collecting such data as will enable them to work with profit on the adornment of the roads after the construction is well in hand. The American and English elms have the advantage of fairly rapid growth, with shade high above ground, and the leaves falling from them give but little obstruction to the gutters. They have the disadvantage of being subject to the attacks of insects, so that the cost of protecting them from these pests would be considerable. Maples grow well and are beautiful, though they often shade the road too much. It is the custom in parts of Europe to plant the road-sides with trees which yield profitable crops. In France and Germany, for example, cherry trees abound. In these countries the yield of the wayside trees belongs to the neighboring land owners, but in some cases to the community, and their product is well guarded by law. There will be more or less experimenting on the part of the Commission before they decide upon the species to be planted. The law provides for the beginning of this work in the Spring of 1895, and from that time it will be carried on slowly, so as to give us the benefit of experience.

Every State should make a beginning on road improvement. In thinly settled regions of the country, where the people do not feel able to undertake much, they can do no better than to start the reform by constructing sections of single-track roads. No community can afford to neglect the common roadways. Our prosperity is too intimately connected with the facilities for communication.

I have spent many thousands of dollars in inaugurating and advancing this reform, and continue to take an active part in it, though for a long time I have not addressed you on the subject.

The interest is now general, and the leaders numerous, consequently there is a demand for road news, more especially for the recent advancements in the line of actual experience.

ALBERT A. POPE.

GLASGOW—A MODEL MUNICIPALITY.

TO the thoughtful mind, nothing is more interesting or a more hopeful sign of the times than the growing interest which we in Great Britain are learning to take in questions of municipal government. Sixty years ago representative municipal government, in the sense that we attach to the word to-day, was a thing unknown. The towns were then in the hands of the old close corporations. The representive principle only received final sanction in 1833, in Scotland; two years later, in England. It has grown up with the Victorian era, nor is it the least of the important developments that have done the same. Perhaps a cynic might find significance in the fact that the real importance of Parliament as an administrative body has been steadily decreasing during the same period. The House of Commons has been more and more given up to the demons of speech, irrepressible and leading nowhither, until in this present year of grace men are learning to look to the remarkable renascence of municipal spirit as the most likely source of the reforms that are needed to adjust the conditions of modern life to modern people. Even London, whose inherited *inertia* has combined with her proximity to the central authority of the Empire to make her neglect her own salvation, has at last awakened to the desirability of good self-government, and the consequence is that her inhabitants have, some of them at least, ceased to ask, with disdainful scorn, whether any good thing could come out of Nazareth or Sunderland. They are not unwilling to take counsel from the experience of Berlin and Paris, even of Manchester and Glasgow. The whole change that has come over the public mind in this respect in the last twenty years is admirably expressed in a recent speech of Mr. Chamberlain, who has himself contributed to it in no small degree. "Now," he said, "people are beginning to appreciate the fact that municipal government is the most potent agent of social reform, and that it is the best instrument by which the wealth and the influence and the ability of the whole community can be concentrated and brought to bear in order to relieve the pressing wants of its least fortunate members, and in order to raise the general level and standard of the whole population." There are many towns to-day from which this definition might be illustrated. Manchester and Birmingham and Bradford are all keen at the work. But Glasgow, whom her citizens delight to call the second city of the Empire, assuredly deserves the name of first, both in regard to the chronology of modern municipal development and to the success with which she has executed all her designs. Glasgow was on the crest of the wave of reform which began to gather in the cities of the United Kingdom about the middle of the century, and she has many lessons to-day to teach even her most advanced sisters. Some of these I am now to sketch, with the apologies for the necessary limitation of my canvas.

The municipal policy of Glasgow for the last fifty years may be defined in words used by her present Lord Provost, Mr. James Bell, who is himself an epitome of the social enthusiasm, the business capacity and the enterprise that distinguish the city over which he rules. It is, in brief, to attempt to make the life of the citizens as healthy and as happy as is possible. The Corporation recognise three duties as being lain upon them: to fulfil their trust by economical administration of the city's finances; to improve public health, both physical and moral; and to give brightness and the possibility of happiness to civic life. There are few residents in Glasgow to-day who are unwilling to admit that this rather ambitious programme has been carried out to the full. Good financial management is placed first partly because the Glasglow town council is composed of business men who apply the lessons of their practical life to their municipal work; partly because (to quote the Lord Provost again) their duty "is to the whole body of the citizens rather than to individuals, and low rating is the most widespread of boons." The result is that the well-to-do Glasgow householder enjoys his manifold advantages for a rate of little more than half-a-crown, while his poorer brother is still more lightly taxed. Beyond that, the Glasgow Corporation hold it their duty to undertake the supply of those necessaries of life—light, fresh air and pure water—which private enterprise cannot generally be trusted to provide. Further, they attend to the prevention and cure of the moral and physical diseases that always threaten a large community. They prefer prevention to cure, and therefore they endeavour to give everybody a chance of owning a clean and decent home, with fresh air, sunlight, and opportunities of recreation for himself and his children. Parks and picture galleries, recreation grounds and concerts are supplied by them on a sound commercial basis. "The power of the multiplied penny" is very thoroughly understood in Glasgow, where Councillors are accustomed to boast that for an infinitesimal fraction in the rates they can give their constitutents parks and picture galleries that no millionaire could afford to own so near the heart of a town. Indeed, if the chancellor Oxenstiern had known Glasgow to-day, he would probably have instructed his son to go and see with how little expense and how little fuss the world could be governed, and so have deprived the leader writer of one of his favourite *cliches*.

As in case of most governing bodies which have come into being by evolution, not by creation, the functions of the Glasgow Corporation are distributed in a somewhat arbitrary manner. The seventy-seven gentlemen who compose the Council meet now as one body, now as another, for the discharge of various duties. This Proteus-like transformation is a relic of the past that might be spared. But there is no difference in the constitution of the various ruling bodies, and the Council is really one and indivisible for all its functions. The administration of the city's property is in the hands of the Town Council, as also that of certain minor trusts chiefly educational. Next come the trusts of greater importance which are in the hands of the Magistrates and Council of the City of Glasgow. Thus we have the City Improvement Trust, the Markets Trust, and the Water Trust. The supply of gas and electric light, the parks and picture galleries, the public baths and wash-houses, and the tramways are also managed by the Town Council. That body controls in addition the Michell

Library, a collection of upwards of 100,000 volumes, which Glasgow owes to private generosity. Persevering attempts are being made to get the Free Libraries Act adopted, but it is one of the few blots upon the fame of the city that they have not yet been successful.

The Corporation adopts the name of the Police Commission in order to discharge some of the most important of its duties. Indeed, it may be said that the Town Council might perhaps be spared, but the Police Commission never could. It has also been said that that the one corresponds to the spiritual power, the other to the secular arm; but it is not well to push the metaphor too far. The name of the Police Commission recalls the old Scottish connection with France and the once universal Roman law. It must be taken in the wider significance of the Greek *politeia*, rather than in the narrower sense which England attaches to the word. The duties of the Police Commission of Glasgow include the work of the policeman proper, of the lamplighter and the fireman—watching and lighting, in short; further, the whole of the very important sanitary department, the repair and cleansing of the streets, and the purification of sewage before it is sent into the Clyde, a work that is as yet only done in part. It has long been contended by certain critics that this distinction between the Council and the Police Commission is wasteful, since it involves the duplication of certain officials, and it is possible that the administration of the city will soon be unified in name, as it has long been in reality. But this is another story.

When an outsider proceeds to look more closely than this Pisgahsight has done into the municipal activities of Glasgow, he finds that both in chronological order and in magnitude the water supply is the first matter that calls for attention. This has long been a text for the sermons of would-be municipal reformers in other towns. The wave of municipal progress that appeared in Great Britain about the middle of the century probably arose from the scare that was caused by frequent outbreaks of cholera and typhus in the large towns. In Glasgow it showed itself in uneasiness about the water supply, which was then derived from the comparatively unpolluted Clyde. Forty years ago this supply was both impure and limited; nasty, though by no means cheap; and the Corporation decided, with some misgivings, to venture on the then unprecedented step of taking water for their city from the beautiful and romantic Loch Katrine, thirty-five miles distant. The domestic water-rate was then 1s. 2d. in the pound. In the course of the first sixteen years years after the introduction of the Loch Katrine water it was reduced to 8d., and for the last four years it has stood at 6d. The necessary raising of the Loch has destroyed the famous Silver Strand but Glasgow is not so romantic as to think that an offset to the fact that the water, "caught within cloudland, is purity itself." There is practically an unlimited supply for domestic purposes, and in consequence the Corporation are able to rejoice over the fact that Glasgow is said to use more water per head of her population than any town in the kingdom. Only Dublin gets cheaper water, and not even Manchester gets it better.

The finance of the matter, though dry, is practically interesting, since it relates to the first experiment in municipal collectivism that was made on a big scale in this country. One cannot, unfortunately, say of statistics, as Philaminte did of Greek, that with them *on ne peut gâter rien*; but on a subject like this the reader must be entreated to pardon a certain sprinkling of figures. The capital outlay on the waterworks up to 1894, then, was nearly two and a half millions sterling. In 1870 a sinking fund was established. Through its agency about three-quarters of a million have been paid off up to the present time. And this sinking fund will pay off the whole of the remaining debt by 1941, when the present waterworks will be the unencumbered property of the Corporation. In the meantime the supply of water has been immensely increased, the quality vastly improved, and the price more than halved. It has been calculated that the aggregate saving to the consumer since 1870 amounts to more than two-thirds of the debt now outstanding. It has, in short, been conclusively proved that municipal management of such a business as the supply of water is compatible with a direct saving of money to the consumer and a great improvement in the supply, while it is impossible even to guess at the economy in life and coin that has been effected by the introduction of the soft, pure, and abundant water of Loch Katrine to the crowded city.

The Water Trust is also about to supply power in the form of water at a pressure of 1,000 lbs. to the square inch, throughout the business area of the city. The hydraulic mains will be extremely useful in case of fire. Further, the selling of power ought to prove another interesting experiment in municipal "business."

Along with water one naturally thinks of gas as another necessary of life. Here, too, the Glasgow Corporation have long held the field. It was no doubt, the marked success of their dealing with the water that encouraged them to assume control of the lighting of the city. In 1869 they took over the production and sale of gas from the two private companies which then performed it. The quantity of gas sold has since more than trebled, while its price has been correspondingly decreased. The total debt on the gas works is still nearly two millions, but one is credibly assured that this formidable sum will be cleared off in twenty-five years from now by the operation of the present sinking fund.

The Corporation have also supplied electric light for the last three years. Many streets are lighted with it, in a rather pleasing fashion, and there are about five hundred private consumers.

But perhaps the most brilliant affair is the undertaking of the tramways. The history of this business is worthy of record. The tramways of Glasgow have hitherto been worked by a private company which had a lease of them for twenty-three years, that expired June 30, 1894. Some six years ago the Council requested the Tramway Company to assent to certain conditions, regulating, amongst other things, the hours of work of the Company's servants. The Company refused point-blank to do anything of the kind. Immediately thereafter it was suggested by some of the more advanced Councillors and their friends—especially by their friends—that the town should take the tramways into its own hands on the expiry of the lease. For some time this proposal was generally treated as "rank Socialism." But it was not long in commending itself to the citizens. As often happens, the citizen tail wagged the Corporation dog, and a speedy *volte-face* was made by Councillors who had been most backward in the matter. The Company, confiding in what is fondly considered to be its necessity to the town, refused to make any concessions. And so it was determined that the lease should not be renewed. One consequence of this was that the Company felt itself much injured, and threatened to do its utmost to wreck the Council's business. It was known that the Company was going to

put omnibuses on all the tramway routes, and to start a brisk competition; also that the Council had to begin the service without experience, with new men, new plant, and new horses. So this notable experiment in municipal tramway management was tried under perhaps the most unfavourable conditions that could have been selected.

It is no light matter for inexperienced men to start a tramway business on a scale that involves 300 cars, 3,000 horses, and 1700 men, even with plenty of time in which to prepare. The only possible practice that the Corporation could give their men and horses was "under difficulties, in tracks temporarily laid down at the depot." Their achievement under the circumstances was little short of miraculous. At midnight on June 30th the last of the Company's cars left the lines. At five the next morning those of the Corporation began to run. Luckily it was a find Sunday; still more luckily, the citizens were well aware that the experiment was being made in their interest, and were lenient judges of the inevitable defects of the first few days. The general criticism was, that these defects were wonderfully few in number.

It was a trial start, and with so many new men and unaccustomed horses, some confusion might not unnaturally have been expected. On the contrary, however, the service seemed to go like clock-work from the first hour . . . The horses were only given about half work to begin with, and this was gradually increase as they became somewhat seasoned. Within two months from the start they were able for full work, and the complete service of cars was running."[1]

There was no doubt whatever that the new cars were a vast improvement upon the old. They were larger, more roomy, and much easier of access. The corporation, besides improving the service, also reduced the fares. They introduced the halfpenny fare, hitherto unknown; they extended the penny stage, and made twopence the maximum fare. There were not wanting critics to declare that, in face of the keen competition of the old company's 'buses, this was madness, and to prophesy a serious deficit on the first six months. The Corporation refused to be discouraged, and gave their servants the six-day week, not to exceed sixty hours in all, while the Company has steadily declined to concede.

About two months ago the first opportunity was given for judging as to the financial success of the Corporation. To satisfy the very general and not unjustifiable curiosity, a trial balance was struck for the half-year ending December 31, 1894, The Lord Provost announced the gist of this as follows:—

"The result is that, after providing for all charges for working, maintenance of plant (including permanent way), interest, and also payment to the Common Good, as arranged at the rate of £9,000 per annum, the accounts still show a credit balance on the six months' working; or, to give it perhaps in more detail, the revenue has met all working charges, interest on capital, the half-year's payment to the Common Good, upkeep of cars, upkeep of plant and buildings, upkeep of permanent way, covers loss of horses by death and horses found unsuitable and sold under cost, and still leaves a credit balance; and further, nothing has been placed to capital beyond initial expenses incurred prior to 1st July last. It must be kept in mind that this result has been achieved with the keep charges of a full stud of horses, but as these at 1st July were soft and unfit for heavy work, the service was begun with only 108 cars, gradually increasing until now about 250 are in daily use. All fares have been reduced, on some routes to the extent of 33 per cent, while to the great benefit of the people, halfpenny fares have been introduced."

This result, in face of the opposition of the 'buses, is enough to fill every believer in the possibilities of municipal enterprise with gratification, and reflects much credit upon the business powers of the men who engineered it.

Continued in June number.

(1) Let me here say that this quotation is taken, like so many of my facts, from the admirable summary of the year's work now annually published by the Lord Provost, whose innovation may be recommended to the heads of other municipalities; let me also take this opportunity of thanking him and other members and officials of the Corporation for the courtesy with which they gave me the information I desired.—G. F.

MOSCOW'S BIG BATH-HOUSE.

THE death of the enormously wealthy Russian philanthropist, M. de Tegorow, at Moscow, will probably have the effect of opening to the public the great baths which, some nine years ago, he caused to be constructed under the shadow of the Kremlin walls. Not only was provision made for the classes, but also for the masses, while the clothes of each bather who desired it were to be washed and ironed free of cost. M. de Tegorow spent many million roubles in the erection and furnishing of this establishment, which was to have been thrown open on January 1, 1885. Dismayed, however, by the prospect of too much cleanliness, the gypsies, whose aversion to the quality which is generally considered as being next to godliness is well known, determined to devote all their efforts to frustrate the excellent intentions of the philanthropic millionaire, and consequently an old woman who had besought him to permit her to tell his fortune, warned him that he would die on the day that the baths were opened. Like all his countrymen, M. de Tegorow was extremely superstitious, and the dismal prophesy resulted in the huge structure with all its magnificent appointments remaining unopened and unused. Meanwhile, the object of the gypsies had been attained, for nobody would invest money in the construction of other baths while any possibility of those built by M. de Tegorow remained. The result is that Moscow and its citizens have lived up to their reputation of being the dirtiest city and the most uncleanly people, not only in the Empire, but in all Europe. It is likely, however, that before the summer comes, the establishment will be in full operation, and that the people of Moscow will have the oportunity of pronouncing themselves in favor of cleanliness or filth.—*Marquise de Fontenoy in the Philadelphia Press.*

RICHMOND IMPROVING.

SINCE January, 1893, up to date there have been over 2000 houses built in San Francisco, of which it is estimated 15 per cent have been erected in Richmond. Miles and miles of streets have been graded and sewered. A scientific system of sewerage, with proper outlet to the bay, has been laid down, and to-day, it is said, Richmond is the only properly sewered district in the city. It also enjoys excellent transportation facilities, and when the Sutro road is completed and the Geary street line continued it will, with those roads now running through the district, be ahead in this respect also. Saltwater mains have been laid in the district for private baths, flushing sewers, sprinkling streets and putting out fires, for which purposes it is superior to fresh water. The Spring Valley mains give an abundant supply of good fresh water. The location, scenery and shelter is unsurpassed. Its closeness to the park and bay, coupled with the advantages enumerated above, make Richmond, with its magnificent marine views, a favored locality for building homes.—*Daily Call.*

DURABILITY OF RED LEAD ON IRON.

AN old painter thus sums up his fifty years' experience with red lead as a paint on iron work exposed to severe atmospheric influence: "It was about thirty years ago that I first began to take any interest in the causes of decay in paint on iron surfaces, and then I began to think and inspect work I had done ten years previously. About thirty-five years ago I had to do some iron rods, which were string-bolts for holding a large roof together in a flax spinning factory. These rods had been painted with oxide of iron and had rusted. They were cleaned to the iron, and so thoroughly that the iron was made bright with rubbing. I had to paint them with red lead mixed with half oil and half turps, and some liquid dryer of my own make. This dryer was composed of black wad, red lead and oil boiled to a pulp and then thinned with turps. The second coat was about the same as the first. The third coat contained less turps, and the fourth and last coat hardly any turps. This work has not been done since, and is to-day as perfect a protection to the iron as then. Four years ago I visited the place and was allowed to examine these bolts, and when I scraped off the paint the iron was as bright as when I painted them. Another case is a water wheel which has been built seventy-five years. Twenty-five years ago I had a contract to paint this wheel. The owner thought he would have it cleaned and painted. I employed men to clean it thoroughly and to my surprise I found no rust. When I called the attention of the owner to the fact, he informed me that his father had painted it fifty years before, when it was built, and the red lead was made from ore got in a hill just by, and smelted in the village. However, I gave it two coats of red lead, mixed as I have stated. This wheel is still running, has not been painted since and is in good condition. Now, in regard to work rusted on a smooth surface, I have done work of this kind also, which has been exposed to the sea air. My first step is to clean thoroughly, and then, if badly rusted, to mix a thin mixture of lamp black with plenty of turps and dryers, and a little oil, and when dry apply the red lead as above. This will give a lasting job, as the lamp black arrests and prevents the rusting. In conclusion, I would say if any of your readers want a job of iron painting, let them try the above plan, and I am sure that they will be repaid for the trouble and extra cost as compared with the customary *wash* of matallic paint and oil."—*The Hub.*

TRADE PAPERS DESERVE THEIR SUCCESS.

A man who subscribes for a trade paper does so, not only because he is alive to the interests of his trade in general, but because he expects to find in it—and generally does—information and suggestions of value in the conduct of his own business. Such a man reads his paper from end to end, advertisements and all, commenting as he goes along. Many things are jotted down on his memo. pad for every day use, as well as for inquiring further into on his first visit to market. And as it is necessary for a man to be wide-awake nowadays in order to succeed in business, these are the men who subscribe to their trade journal, and are the advertisers' best patrons. The cannot afford to pass anything which promises help or suggests additional profits. Hence, the trade journal is the best medium for advertising things which concern the business man.—*Newspaperdom.*

APARTMENT HOUSES AT POMPEII.

OUR architects should not forget that the modern system of hotels and apartment houses on a vast scale is merely child's play compared with the practice of the ancients in the same direction. Recent excavations at Pompeii have unearthed some enormous buildings of such beauty and solidity in architecure, such perfect drainage, and such provisions for health and comfort as to fill all who have seen them with astonishment. These newly discovered buildings contain thirty or forty immensely spacious apartments on the first floor, and as many on the second. The rooms looked out on a rotunda nearly forty feet long; courts supported by columns surround the bedrooms which opened upon large, ornamental gardens with fountains. Provision for light and air was made upon the most extensive scale. On the second floor were found evidences that there were suites of rooms built upon the flat plan of to-day. In fact, the revelations made by the exhumers at Pompeii show that place to have been one of the most wonderful watering places for splendor, comfort, health, and enjoyment, and gave every evidence that floor-renting, like many other modern improvements, is not a new thing under the sun.—*Carpenter and Builder.*

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street
SETH BABSON, Pres. GEO W. PERCY, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
OCTAVIUS MORGAN, PRES. A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec't. AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

BOOKS AND PERIODICALS.

THE NEW SCIENCE REVIEW. A miscellany of modern thought and discovery, conducted by J. M. Stoddart, published in Philadelphia, New York and London.

This quarterly review made its fourth appearance in April and continues to sustain the promise made in the opening number—while at times it flutters near the boarders of the unknown. It contains much of practical and useful information, along side of John W. Keely "Operation of the Vibratory Circuit."

"Where the Steamboat was Born" by Maggie Symington, as well as autobigraphical notes by Prof. Richard A. Proctor, are very delightful to read, and will prove of interest to the general reader while "Ether and its Functions," by Geo. Fraser Fitzgerald, F. R. S., Trinity College, Dublin, belong to the realm of science; "Railroad Facts and Figures" by Melville Philips come home to the hearts of all, as who does not travel nowadays. The facts here given would have been thought visionary and impossible fifty years ago.

THE YELLOWSTONE NATIONAL PARK. "Sketches of Wonderland" is the title of a beautiful pamphlet published by the Northern Pacific Railroad of which Chas. S. Fee, St. Paul, Minn., is the general passenger and ticket agent, it will be sent to any address on receipt of six cents in stamps. Anyone on the lookout for the summer outing, cannot do better than to send for a copy. This is no common adqertising sheet, but truly a work of artistic merit, that no one can examine with care, without a desire to see something of the "Wonderland" so graphicly described.

OUR DUMB ANIMALS.—This always welcome publication is before us, as ever its hand and pen is raised against cruelty to dumb animals in any form, but more especially to the cruelty of docking horses. As a specimen of Mr. Angell's direct way of writing we quote the following from the April number, after giving extracts from "The Nineteenth Century" by Dr. Geo. Fleming, a distinguished English veterinary surgeon, he adds: "Any man who, having read it, will be guilty of causing another Polo pony or other horse to be so mutilated, is either a heartless fool, a heartless scoundrel, or an incomprehensible idiot."

The following extract shows that Mr. Angell is as full of fun as he is full of mercy:

Flossie is six years old. "Mamma," she called one day, "If I get married will I have to have a husband like pa?" "Yes," replied the mother, with an amused smile. "And if I don't get married will I have to be an old maid like Aunt Kate?" "Yes." "Mamma,"—after a pause—"it's a tough world for us women, ain't it!"

THE FORTNIGHTLY REVIEW for April, 1895, published by Leonard Scott Publication Company, 231 Broadway, New York, comes to hand full of good things as usual, among others one that should be read with care by all lovers of their country, and a sound currency, we refer to "The Monetary Question" by Honorable Alex. Del Mar.

GEYER'S STATIONER.—Devoted to the interests of the stationary, fancy goods and notion trades, a weekly journal published in New York.

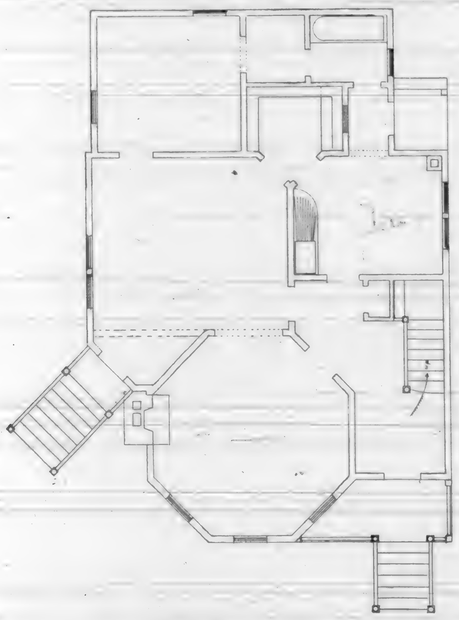
As all the business world is interested in good stationary, it is no wonder that a large mass of information can be accumulated every week on this subject, still the reader cannot help being astonished at the great number of useful and pretty things in the stationary line that this journal calls attention to. Notwitstanding the information is designed to call the attention of the retail stationer of what he may want and where he may get it, the general reader cannot fail to find much of interest even in the advertising column.

BOSTON MUSEUM OF FINE ARTS.

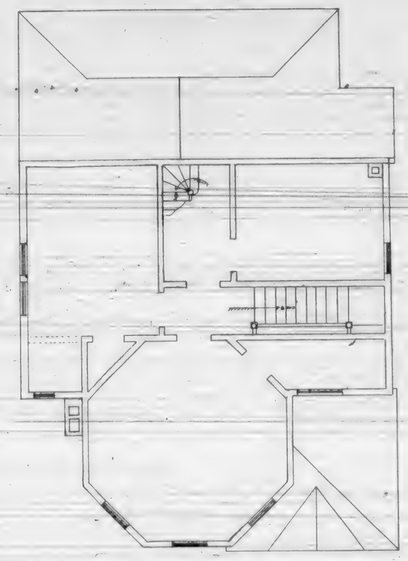
THE Boston Museum of Fine Arts has recently acquired what is beyond comparison the most important collection of Greek vases ever brought to this country. It comprises fifty-three specimens, and those who are familiar with Greek ceramics will appreciate their value from the fact that they include signed examples of such masters as Euphronios, Hieron, Hermogenes, Kachrylion, Duris, Brygos, Pamphaio, Nikosthenes and Xenokles. A number of them contain interesting inscriptions besides the makers' names; but the most remarkable feature of the collection is its intrinsic beauty. Every specimen is a masterpiece of the type to which it belongs, both in shape and in the quality of the drawing upon it, and will appeal to the artist no less than to the archæologist. Boston is not the only city to be congratulated upon this splendid acquisition; for the opportunity it gives to all American students to see Greek pottery at its very best, and the stimulus which is hereby given to the study of the subject, cannot fail to be of benefit to the country generally. It is pleasant to learn that the museum was able to make this purchase out of its own funds, it having received several important bequests lately for the purchase of works of art of various periods.—*Architecture and Building*.

RESULT OF THE CAIRO MUSEUM COMPETITION.

CONSUL-General Penfield, at Cairo, Egypt, reports to the Department of State that in the recent competition of designs submitted for the new Egypt Museum, in Cairo, none of the American competitiors were adjudged a prize. The prizes, five in number, and aggregating $5,000, were secured by Paris architects. The contest was open to architects of the world, and eighty-eight, representing nearly every European country, as well as the United States, participated in the competition.—*Exchange.*



FIRST FLOOR PLAN



SECOND FLOOR PLAN

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

INJURIES FROM BRICK FALLING FROM A WALL.—The fact that a contractor failed to erect proper scaffolding guards about a building because they could not be erected without occupying adjacent property, and that he was prohibited from so occupying it, will not relieve him from liability for an injury to a third person through the absence of such guards.

One superintending the construction of a building, as agent of the contractor, is equally liable with his principal for such injury, or from the negligent construction of the wall.

Mayer v. T. H. Building Co., Supreme Ct. Ala., 16 So. Rep. 620

RIGHTS AND LIABILITIES OF CONTRACTORS.—Where a contractor sues for the reasonable value of extra work, without setting out the building contract, the defense that its value has not been submitted to arbitrators, as stipulated by the contract, is waived by pleading to the merits.

Where the specifications require the contractor to rub down all brick work on street sides, he cannot claim pay for cleaning street walls with acid as for extra work.

A modification of a building contract so as to require pressed brick walls, impliedly requires pressed-brick chimneys, which are a part thereof.

A contractor is not liable for failure to keep the walls plumb, as required by the contract, where the defect is due to the addition of an extra story without strengthening the foundations.

The measure of damages for failure to use the grade of plastering required by a building contract is the difference between the class of work contracted for and that which was furnished.

Chamberlin v. Hibbard, Sup. Ct. Oregon, 38 Pacific Rep. 437.

OBSTRUCTION OF LIGHT.—The easement of light and air cannot be acquired, according to the general current and weight of authority in this country, even by prescription, and of course no right to object to the obstruction of one's windows by a wall erected on the land adjoining can be said to exist. Therefore, one who leases rooms in a building is not entitled to damages from an adjoining land owner because the latter builds so as to shut off the lessees' light on the side of the leased premises.

Lindsey v. 1st. Nat. Bank Asheville, 20 S. E. Rep. 621.

DAMAGES FOR BREACH OF BUILDING CONTRACT.—Where a building contract stipulated that the contractor should pay ten dollars per day as liquidated damages for every day's delay after a certain date, and the building was not finished at such date, and there is no evidence by which the actual damages can be ascertained, the amount of the recovery is governed by the stipulation. Where the owner entered and occupied a part of the building before it was finished, the damages are recoverable only from the time it was agreed to be done and the date on which the owner entered it.

If the stipulation greatly exceeded the actual loss, if there be no approximation between them, and this be made to appear by the evidence, then and then only, should the actual damages, under such a contract, be the measure of recovery.

Collier v. Betterton, Supreme Ct. Tex., 29 S. W. Rep. 467.

MECHANICS' LIEN IN NEW YORK.—Under the laws of New York, 1885, c. 342, sec. 5, providing that mechanics' liens shall be preferred to any conveyance, judgment, or other claim which was not docketed or recorded at the time of filing the notice of lien, a lien filed after the death of the owner for work done before his death does not attach to the interest of the owner's devisees.

The court said: No provision is found in the statute giving the claimant the right to acquire a lien after the death of the owner. Mechanics' liens are created by statute, and while the law should receive a liberal construction, so as to secure the beneficial purpose had in view by the legislature, yet, as it creates a remedy unknown to the common law, it may not be extended to cases not fairly within the general scope and purview of the statute.

Turbrid v. Wright, Court of Appeals, 39 N. E. Rep. 640.

MEASURE OF DAMAGES FOR BREACH OF CONTRACT.—Where a party has contracted to move a building for a stipulated sum of money, and then neglects or refuses to perform, the other, if he has the work done by some one else, is entitled to recover as damages the difference between the contract price and the reasonable cost or expense of performance in accordance with the contract, if there is any difference.

Anderson v. Nordstrom, Supreme Ct. Minn., 61 N. W. Reporter 1132.

BUSINESS MOSAICS.

Revere Rubber Co., 527 Market street, San Francisco, manufacturers "Schenck" Swinging Hose Reel. The company claim the use of this hose will reduce the Insurance rate. It is adapted for mills, factories, hotels, public buildings and general inside fire protection.

Syms—"I don't understand this question of labor and capital." GARNER—"It's very simple. Labor wants capital at the least possible exertion, and capital wants labor at the very smallest outlay."—*The Wasp.*

If you are going to build use Neponset Papers! Why? Because if you use this paper, manufactured solely by F. W. Bird & Son, you will have a paper that is sure to give satisfaction as it makes a handsome and permanent covering for roofs and sides of store houses, factories, poultry houses, farm and other outbuildings. It is very much cheaper than any tar and felt or composite roof, and is a great deal less in cost than shingles. So much for Neponset Red Rope Roofing Fabric, also Neponset Black Building Paper, water, air and vermin proof.

McGilder—"Prize fighters are nothing more than a lot of beggars." O'JONES—"How do you make it out?" MCGILDER—"Because they are always striking somebody for money."—*Brooklyn Eagle.*

On or before May 31st our Principal Office, heretofore located at N. W. corner Pine and Montgomery streets, will be removed to Foot of Third street, below Third and Townsend street R. R. Depot, and on the line of the Kearny and Third street, Electric road; all Market Street Cable and Mission Street Electric cars transfer to this line.

We will maintain an Uptown Order Office at 405 Montgomery street, corner of California street, and will be pleased to see you at either office. Our telephone numbers are:—Principal Office, Foot of Third Street, Main 1047. Uptown Order Office, 405 Montgomery street, Main 1480.

If you have no gas cooking stove in your house, do not delay ordering one at once. Your wife will thank you, your coal bill will decrease enough to pay for the extra gas, and you save a lot of bother in dust and ashes. The San Francisco Gas Light Co., Stove department, 226 Post street, will find exactly what you want.

She—"Do you believe in spirits?" HE (from Kentucky) "I do when they are good."—*Peck's Son.*

When a man decides upon improving his shop, factory or farm, by the addition of power, he naturally looks for something entirely up to date. He investigates considers, and finally decides to buy an Ajax Coal Oil Gas Engine as meeting his requirements more fully, and being safer, than any other power obtainable. Palmer & Rey, San Francisco, Cal., the manufacturers of this engine, have carried the gratitude of the public by placing within its reach a reliable, economical power, that defies the restrictions of insurance companies. It is the latest and best.

"Does this roof leak always?" AGENT—"Oh, no, ma'am, only when it rains."—*Chicago Inter-Ocean.*

M. S. James, Pacific Coast Representative of the J. L. Mott Iron Works has his office at room 35 Flood Building, San Francisco. The quality of the goods manufactured and supplied to the trade by this firm are too well-known to require a recommendation from us, for like good wine they requires no bush.

Nevertheless, to those about to build, or renovate their premises we would strongly urge the importance of giving Mr. James a call before deciding what class of plumbing materials to order, as anything from the smallest house to the largest hotel, is greatly improved by having first-class materials used for all plumbing required. It is a great satisfaction to deal with a house that you are sure of getting your moneys worth.

"The Old May Flower" Roofing Plates, Re-dipped Old Process, Extra Quality. These plates are guaranteed to be coated with 19 lbs. metal on each box of 14x20 and 38 lbs. metal on 20x28, which is a heavier and better coating than any other works put on Re-dipped Ternes. Made of the softest and best quality of steel, true to size, cut square and free from blisters and other imperfections.

Architects and builders should bear these facts in mind when making specifications where durable and first-class roofs are desirable. Sole importers, W. W. Montague, 309, 311, 313, 315 and 317 Market street, San Francisco, and 122 North Los Angeles street, Los Angeles.

Mrs. Hunter—"I like the flat because it has so many nice closets in it." AGENT—"Great Scott, madame! Those are not closets—they are bedrooms."—*Wasp.*

Ives Patent Sash Locks.—It is important that every house should be made as safe as possible against the attack of sneak thieves, nothing that has been devised in the way of Sash Locks appear to answer the purpose so well as the above mentioned patent sash lock manufactured only by Hobart B. Ives Co., New Haven, Conn. The important features are in securely locking when opened or closed, and simultaneously carrying the Meeting Rail in position, and drawing them closely together. Price list mailed free showing fifty styles in Sash Locks and door bolts. See their advertisement on page xi of this journal.

"So old Squibbs is ill eh?" "Yes; was so bad yesterday that they considered a consultation necessary." "Consultation of doctors?" "No; lawyers."—*Judge.*

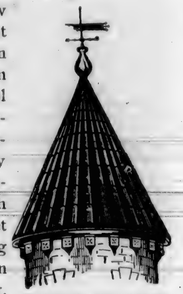
Trade Notice.—Messrs. N. & G. Taylor Co., Tinplate Manufacturers, of Philadelphia, announce that they have given up their old quarters in Water street, New York City, and have moved to the Cable Building, 621 Broadway where they have opened new and commodious offices with a corps of assistants in charge of Mr. George Livingston, a gentlemen who has long been identified with the building and kindred trades of New York and Brooklyn.

The firm also announce that they have secured larger and better warehouse facilities for the quick filling of orders. Consumers wanting their special brand, the celebrated Genuine Taylor "Old Style", extra heavy coated, and also other brands, manufactured by this firm, can secure prompt attention by communicating with the firm's offices, as above stated.

"And I only married to reform you!" "Yesh, but of coursh a man drinksh more if he marries such a fool."—*Life.*

If you want to stop the slamming of that door, all you have to do is to order "The Norton Door Check and Spring" this will render the slamming of doors an impossibility. A simple and durable air cushion check, charging itself when door opens. Not liable to get out of order. Its merits have been proved by being in constant use in this city and elsewhere for the last twelve years. Duplicate parts always on hand. Frank D. Morrell, 593 Mission street near Second street, San Francisco.

There are at the present time few first-class buildings being erected that do not have one or more towers upon them, and no feature of the modern building adds more to its architectural beauty than a graceful and well-proportioned tower. Yet in their construction a difficult problem has invariably arisen as to a suitable covering—especially for conical towers, for which there has been nothing in the market adapted, the only available covering being wood shingles, which split when drawn to the convex form of the tower. Slate will break from the same cause, and metal shingles of forms designed for straight roofing, involves a waste of just fifty per cent of materials in fitting to cones and a greater waste of time in putting on, as after the first course each succeeding one has to be reduced in size and practically made over by the roofer.



GRADUATED TILES

Messrs. Merchant & Co., the well-known Philadelphia tin-plate manufacturers and importers, have recently put upon the market a Graduated Tile, which is a valuable addition to their regular "Spanish" Metal Tile, and which is adapted for covering all conical towers, circular roofs, turrets, domes, etc., being so graduated in size and form as to fit almost any radius. This title is manufactured in copper, steel or tin, the latter being painted in imitation of the red clay tile. As tower roofs are always the most difficult portions of a building to get at to repair or repaint, they should be covered with that which will never require either. Copper, therefore, is the only material that will meet these conditions, being indestructible, and becoming richer in appearance with age. The Merchant & Co's Metal "Spanish" Tile has been specified by leading architects throughout the United States both for private and public buildings. Numerous buildings at the World's Fair were covered with this tile, prominent among which might be mentioned the Colorado, Minnesota and Missouri State Buildings. This tile is also in use on the new City Hall at Tacoma, Wash., the new Union Depot, Denver, Grand Central Station, Portland, Ore., and the Chamber of Commerce Building, Portland, Oregon; also the new Princeton (N. J.) Inn., a beautiful building, the roof of which is almost entirely covered with copper tile, and presents a very rich appearance. Girard Building, Phila.; San Bernardino Court House, Cal.; Baptist Church at Gouveneur, N. Y.; Congregational Church at Gloverville, N. Y.; Bingham Hall, Canandeigua, N. Y.; Crocker Building, Santa Barbara, Cal.; College Arms Hotel, De Land, Fla.; People's Institute, Chicago, Ill.; Winthrop College, Rock Hill, S. C.; Grace Church, Nashville, Tenn.; Church at Fulton, N. Y.; Central School, Guthrie, O.; Library Building, Lawrence, Kan.; Manhattan School, Manhattan, Kan.; City Hall, Wilke Barre, Pa.; Modesta Bank Bldg., Modesta, Cal.; Swain Residence, W. Philada.; First National Bank, Orlando, Col.; Pens. Hospital for Insane, Phila.—*The Engineering Magazine, May, 1895.*

BUSINESS MOSAICS.

Austin near Larkin. Eight circular wood tanks; owner, Olympic Salt Water Co.; architect, H. A. Schulze; contractor, Krogh Mfg. Co.; signed, April 19; filed, May 3; cost $3285.

Bryant near 22d Ave. To build; owner, E. J. Stanley; contractor, A. Olsen; cost $3500.

Bryant Ave. [Preston Place]. To build; owner, T. F. Kiernan; architect, A. J. Barnett; contractors, Quinn & Barrett; signed, April 29; filed, April 30; cost $1608.

Brannan near 4th. Bricklaying for church; owner, Rev. D. Nugent; architect, J. J. Clark; contractor, James Glynn; signed, April 10; filed, April 12; cost $5.25 per M.

Brannan near 4th. Artificial stone work, etc.; owner, Rev. D. Nugent; architect, J. J. Clark; contractor, S. Giletti; signed, April 20; filed, April 20; cost $4000.

Broderick near Ellis. To build; owner, Mrs. Mary Cochrane; contractor, J. J. Manseau; signed, April 21; filed, April 23; cost $1700.

California near Gough. Cabinet work; owner, J. C. Coleman; architects, Percy & Hamilton; contractor, R. Herring; signed, April 13; filed, April 13; cost $3750.

California near Baker. To build; owner, Mary A. Townsend; contractor, W. W. Rednall; signed, April 18; filed, April 19; cost $1800.

Clay near East. Brick building; owner, J. De La Montanya; architect, Percy & Hamilton; contractors, Thomas A. Day & Sons; signed, April 29; filed, April 30; cost $15,073.

Clay near East. Concrete foundation; owner, J. De La Montanya; architects, Percy & Hamilton; contractors, Cushing-Wetmore Co.; signed, April 15; filed, April 15; cost $3030.

Clay near East. Brick, stone and iron work; owner, J. De La Montanya; architects, Percy & Hamilton; contractors, Peacock & Butcher; signed, April 28; filed, April 30; cost $10,075.

Clayton and Oak. Two two-story flats; owner, J. F. English; contractor, J. V. Hull; cost $8000.

Clement near 5th Ave. To build; owner, Irwin Ingermon; contractor, R. Cook; signed, April 12; filed, April 13; cost $2315.

Clementina near 5th. Additions and alterations; owner, S. Pamery; contractor, J. W. Wyllie; cost $2500.

Clement near 5th Ave. Three two-story frame dwellings; owner, D. F. McGrath; architect, C. F. Robertson; day's work; cost $12,000.

Clement near 5th Ave. Plumbing; owner, D. F. McGrath; architect, C. F. Robertson; contractor, G. C. Sweeny; cost $999.

Davis and Washington. Sewers, plumbing, etc.; owner, Estate of J. Ivancovich; architects, Pisses & Moore; contractor, R. A. Vance; signed, April 26; filed, May 13; cost $1894.

Devisadero near Page. To build; owner, C. J. Kaighen; architect, B. A. Brown; contractor, Pettersen & Person; signed, May 9; filed, May 9; cost $1532.50.

De Haro near 23d. Cottage; owner and builder, D. Pollack; day's work; cost $1500.

Douglass and 24th. To build; owner, James Curtin; architect, A. J. Barnett; contractor, Wm. Plant; signed, April 15; filed, April 22; cost $2700.

Diamond near 22d. Cottage; owner, James Loftus; architect, Chas. Koenig; contractor, A. Petry; signed, April 12; filed, April 13; cost $1580.

Eight near Howard. Alteration and additions; owner, W. Ehrenpfort; days' work; cost $1000.

Eighteenth and Hattie. To build; owner, Agnes Petzold; architects, Martens & Coffey; contractor, J. Bucher; signed, April 18; filed, April 19; cost $3808.

Fair Oaks and 25th. To build; owner, Ed. F. Delger; architects, Kenitzer & Barth; contractors, Anderson Bros.; signed, April 25; filed, April 25; cost $3297.

Fair Oaks near 23d. To build; owner, John Valsanglacomo; architect, A. J. Barnett; contractor, Ed. Mooney; signed, May 10; filed, May 10; cost $3250.

Fella Alley near Powell. To build; owner, August Schiller; contractor, Herman Hansel; signed, April 22; filed, April 24; cost $3060.

Folsom and Rich. Additional story; owner, James Mackin; day's work; $3000.

Folsom street, No. 850. Additions; owner, Mrs. Roach; contractor, F. Schmitz; cost $900.

Folsom near 5th. Alterations and additions; owner, P. E. Dueckein; architect, C. M. Rousseau; contractor, Geo. C. Nail; signed, April 18; filed, April 20; cost $1880.

Folsom near 24th. Alterations and additions; owner, H. Mangels; day's work; cost $1000.

Fremont near Frederick. To build; owner, Fred Heine; architect, E. J. Vogel; contractors, Ogle & Smith; signed, April 8; filed, April 11; cost $3505.

Francisco near Dupont. To build; owner, Mrs. Annie Golelli; architect, C. M. Rousseau; contractor, Jos. Kennedy; signed, April 11; filed, April 12; cost $2270.

Franklin and California. Painting; owner, Edward Coleman; architect, W. H. Lillie; contractor, J. P. Fraser; signed, April 18; filed, April 19; cost $366.25.

Fourth Ave. near Clement. To build; owners, J. Levy and Mrs. M. Levy; architect, H. J. Kraetzer; contractor, W. R. Kenny; signed, May 1; filed, May 3; cost $1200.

Fourth Ave. and Point Lobos Ave. To build; owner, R. R. Hind; contractors, Townley Bros.; cost $5000.

Fourteenth near Guerrero. To build; owner, J. M. Griffith; contractors, Hyde & Cox; cost $3500.

Fifth and Brannan. Lumber sheds; owners, Scott & Van Ansdale Lumber Co.; contractor, H. Munster; cost $800.

Fulton near Steiner. To build; owner, J. J. Dowling; architects, Havens & Toepke; contractor, J. H. McKay; signed, April 17; filed, April 19; cost $3595.

Geary near Jones. To build; owner, Thos. Morton; cost $8000.

Grove near Shrader. To build; owner and builder, W. A. Butler; cost $4000.

Guerrero near 22d. To build; owner, Carrie L. Dick; architect, McDougall & Son; contractor, M. M. Cowie; signed, April 7; filed, April 18; cost $4722.

Guerrero near 22d. Plumbing; owner, Carrie L. Dick; architects, McDougall & Son; contractor, W. F. Wilson; signed, April 17; filed, April 18; cost $1010.

Hayes and Devisadero. Additions; owner, Pacific Hebrew Orphan Asylum and Home Society; architects, Wright & Sanders; contractor, Thomas McLachlan; signed, April 23; filed, April 26; cost $17,900.

Hayes and Devisadero. Grading, concrete, etc.; owner, Pacific Hebrew Orphan Asylum and Home Society; architect, Wright & Sanders; contractors, Peacock & Butcher; signed, April 23; filed, April 26; cost $12,500.

Hayes and Devisadero. Plumbing, etc.; owner, Pacific Hebrew Orphan Asylum and Home Society; architects, Wright & Sanders; contractors, McDevitt & Cleary; signed, April 22; filed, April 26; cost $590.

Hayes near Laguna. To build; owner, John Crowley; architect, T. J. Welsh; contractor, P. Maloney; signed, May 8; filed, May 10; cost $4300.

Hyde and Pine. To build; owner, Charles Schlesinger; architect, E. J. Vogel; contractors, McCulloch & Glunz; signed, April 16; filed, April 20; cost $8087.

Hyde near Union. Alterations and additions; owner, W. Sinon; cost $1000.

Hampshire near Solano. To build; owner, John Francis; contractor, Henry Plant; signed, April 22; filed, April 27; cost $1080.

Haight and Baker. To build; owner, John C. Spencer; architect, F. P. Rabin; contractor, Wm. Tegeler; signed, April 20; filed, May 6; cost $6815.

Howard near 22d. Carpenter work; owner, Henry Smith; architect, C. F. Robertson; contractor, C. Larsen; signed, April 24; filed, May 9; cost $4000.

Jackson near Walnut. To build; owner, Henry H. Bull; architect, R. H. White; contractor, John Furness; signed, April 22; filed, April 24; cost $5390.

Jackson near Scott. Carpenter work; owner, Augusta K. Gibbs; architect, Willis Polk; contractors, Knowles & Elam; signed, May 1; filed, May 7; cost $10,200.

Jackson near Scott. Painting, etc., owner, Augusta K. Gibbs; architect, Willis Polk; contractor, John H. Keife; signed, May 2; filed, May 7; cost $1750.

Jackson near Scott. Planing mill work; owner, Augusta K. Gibbs; architect, Willis Polk; contractors, Knowles & Elam; signed, May 1; filed, May 9; cost $4750.

Jackson near Scott. Stone work; owner, Augustus K. Gibbs; architect, Willis Polk; contractor, John D. McGilvray; signed, May 1; filed, May 9; cost $1200.

Jackson near Scott. Stable; owner, Augusta K. Gibbs; architect, Willis Polk; contractors, Knowles & Elam; signed, May 2; filed, May 9; cost $8118.

Kearny and Post. Iron, steel work, etc.; owner, James Stanton; architect, J. E. Krafft; contractors, P. H. Jackson & Co.; signed, May 2; filed, May 3; cost $2013.

King near 4th. To build; owner, Buffalo Brewing Co.; contractor, J. Bucher; cost $5000.

Laguna near Oak. Alterations; owner, Mrs. McBride; contractors, Searle & Co.; cost $1000.

Laurel near Webster. Brick and cement work; owner, Henry Hock; contractor, Weinecht & Franz; signed, May 8; filed, May 9; cost $2130.

Lyon near Haight. To build; owner, Francis Zilberbier; architect, J. F. Kenna; contractor, H. P. Connely; signed, April 13; filed, May 2; cost $4475.

Market near Sixth. Inside finish of billiard room in Spreckles building; owner, C. A. Zinkand; architect, Emil John; contractors, Bader & Finke; signed, April 11; filed, April 22; cost $1725.

Mason near Eddy. Alterations and additions; owner, S. Klavenmeyer; contractors, Williams & Woods; cost $1000.

McAllister near Polk. Raising old building, etc.; owner, T. M. Quackenbush; day's work; cost $2500.

McAllister near Hyde. Grading work; owner, California Bible Society; architect, McDougall & Son; contractor, A. E. Buckman; signed, May 8; filed, May 8; cost $1680.

Mission street No. 737. Alterations; owner, W. C. Shiels; contractor, W. Little; cost $3000.

Minnesota near Sierra. Alterations to school house; owner, City of San Francisco; architect, Thomas J. Welsh; contractor, Alex. L. Campbell; signed, March 26; filed, March 26; cost $3587.

Minnesota near Sierra. Painting school house; owner, City of San Francisco; architect, Thomas J. Welsh; contractor, L. J. Dwyer; signed, March 26; filed, March 26; cost $1779.

Pacific Ave. near Octavia. Carpenter work; owner, Mrs. Elizebeth Blackwood; architects, McDougall & Son; contractors, Peterson & Olsen; signed, May 6; filed, May 9; cost $6750.

Pacific Ave. near Octavia. Excavation, brick work, etc.; owner, Mrs. Elizabeth Blackwood; architects, McDougall & Son; contractors, Fennell & Son; signed, May 6; filed, May 6; cost $1114.

Pacific Ave. near Octavia. Plumbing, etc.; owner, Mrs. Elizabeth Blackwood; architects, McDougall & Son; contractor, J. E. Britt; signed, May 6; filed, May 6; cost $1095.

Point Lobos Ave. and Fifth Ave. Stone sidewalks, etc.; owner, Society Francaise, etc.; architect, E. Depierre; contractors, Gray Bros.; signed, May 9; filed, May 10; cost $1150.

Point Lobos Road near Pacific Ocean. To build; owner, Adolph Sutro; architect, Colley & Lemme; contractors, Campbell & Pettus; signed, April 10; filed, April 13; cost $35,445.

Powell stree, Nos. 13-15. Alterations and additions; owners, Chas. A. and Silas Green; architects, Havens & Toepke; contractor, Geo. H. Walker; signed, April 11; filed, April 12; cost $6000.

Presidio. Brick building for barracks; owner, U. S.; contractor, F. L. Hansen; cost $10,090.

Sacramento near Maple. Brick building; owner, T. T. Williams; architect: A. C. Schweinforth; contractor, W. A. Butler; signed, April 12; filed, April 17; cost $17,000.

Sacramento near Maple. Plumbing; owner, T. T. Williams; architect, A. C Schweinfurth; contractor, W. F. Wilson; signed, April 12; filed, April 17 cost $1600.

Sacramento near Maple. Electric and gas fixtures; owner, T. T. Williams; architect, A. C. Scheinfurth; contractor, S. F. Novelty and Plating works; signed, April 12; filed, April 17; cost $250.

Sacramento near Maple. Elevator work; owner, T. T. Williams; architect, A C. Schweinfurth; contractor, John Hammond & Co.; signed, April 12; filed April 17; cost $800.

Sacramento near Maple. Electric light wiring; contractors, Will & Fink Co.; signed, April 12; filed, April 18; cost $270.

Sacramento near Maple. Heating and ventilation, etc.; owner, T. T. Williams; architect, A. C. Schweinfurth; contractors, W. W. Montague & Co.; signed, April 12; filed, April 17; cost $2000.

Sacramento and Pierce. Alterations and additions; owner, Mrs. Minnie H. Alderson; architect, F. B. Wood; contractor, R. Currie; signed, April 26; filed, April 27; cost $3595.

San Jose Ave. near 25th. To build; owner, Thos. C. Van Bibber; architect, W. H. Wharff; contractor, John A. McDonald; signed, April 12; filed, April 13; cost $4272.

San Jose Ave. near 25th. Plumbing; owner, T. C. Van Bibber; architect, W. H. Wharff; contractors, Levy & Parker; cost $620.

Sanchez and 14th. To build; owner, Fred Hufschmidt; architect, E. J. Vogel; contractor, J. W. Coburn; signed, April 13; filed, April 13; cost $3296.

Shotwell near 24th. To build; owner, Mrs. Ward; contractor, W. A. Lang; cost $3000.

Sixth and Stevenson. Excavations, concrete, cement, brick, etc., for four-story brick; owner, M. Schwerdt; architects, Laist & Schwerdt; contractor, Adam Beck; signed, April 19; filed, May 4; cost $12,575.

Sixth and Stevenson. Carpenter work; owner, M. Schwerdt; architects, Laist & Schwerdt; contractor, S. H. Knight; signed, April 16; filed, May 4; cost $3737.25.

Sixth and Stevenson. Terra cotta work; owner, M. Schwerdt; architects, Laist & Schwerdt; contractors, A. Steiger Sons; signed, April 26; filed, May 4; cost $2785.

Sixth and Stevenson. Plumbing, etc.; owner, M. Schwerdt; architects, Laist & Schwerdt; contractors, Shephard Bros.; signed, April 23; filed, May 4 cost $1961.

Seventh near Folsom. Alterations and additions; owner and builder, C. Mason; cost $4000.

Steiner near O'Farrell. Alterations and additions; owner, Mrs. Schilling; contractors, Patterson & Person; cost $1500.

Steiner near Filbert. To build; owner, Augustus and Eliza La Croix; contractor, J. J. Wilson; signed, April 15; filed, April 15; cost $1325.

Second Ave. near California. Six two-story frame buildings; owner, Stewart Menzies; architect, J. C. Pelton; contractors, Campbell & Pettus; signed, May 8; filed, May 9; cost $10,238.

Sixteenth near Valencia. To build; owners, R. J. Taussig and Adolph Eisenback; architects, Salfield & Kohlberg; contractor, L. B. Schmid; signed, May 2; filed, May 10; cost $6850.

Sixteenth near Valencia. Plumbing and gas-fitting; owners, R. J. Taussig and Adolph Eisenback; architects, Salfield & Kohlberg; contractors, Clark & England; signed, May 4; filed, May 10; cost $1150.

Twenty-second near Noe. To build; owner, L. Schnetzler; contractor, H. R. Schmuckert; signed, April 20; filed May 4; cost $3220.

Twenty-fourth near Sanchez. To build; owner, Moses Mossford; architect, R. Trost; contractor, Job. Hatfield; signed, May 6; filed May 6; cost $1475.

Twelfth Ave. near Clement. To build; owner, Geo. C. Harrison; contractor, Hans Peterson; signed, April 24; filed April 26; cost $1775.

Twenty-sixth and Church. Cottage; owner, John Todt; architect, W. Schrof; contractor, H. Behrens; cost $2745.

Twenty-sixth near Howard. To build; owner, B. Struven; architect, Emil John; contractor, F. A. Hellmuth; signed, April 27; filed, May 4; cost $3526.

Twenty-ninth near Sanchez. Cottage; owner, W. F. J. Dale; contractor, H. R. Schmuckert; signed, April 17; filed, April 17; cost $1575.

Union near Fillmore. Two-story two tenement buildings; owners, Dr. John and Lizzie J. Hemphill; architects, McDougall & Son; contractor, J. H. McKay; signed, April 16; filed, April 18; cost $5790.

Union and Fillmore. Plumbing, gas-fitting, etc.; owners, Dr. John and Lizzie Hemphill; architects, McDougall & Son; contractor, H. Williamson; signed, April 16; filed, April 18; cost $1280.

Union near Larkin. Additions and alterations; owner, Thomas Scott; architect, W. Mooser, Jr.; contractor, Dwyer, cost $1500.

Union near Larkin. To build; owner, J. W. Lomerlino; day's work; cost $5000.

Vallejo near Van Ness. To build except plumbing; owner, Frank Otis; architect, Seth Babson; contractors, Hickox & Tate; signed, April 11; filed, April 11; cost $2695.

Valencia and 15th. Three-story brick; owner, Rose A. Pickering; architects, Havens & Toepke; contractors, Ackerson & Paterson; signed, April 18; filed, April 22; cost $9643.

Valencia and 15th. Plumbing; owner, Rose A. Pickering; architects, Havens & Toepke; contractor, H. Williamson; signed, April 17; filed, April 22; cost $1764.

Vermont and 24th. Alterations; owner, A. Schuman; contractor, Gus. Williams; cost $1600.

Washington near Laguna. To build; owner, J. D. Tallant; architect, W. H. Lillie; contractor, J. G. Adams; signed, April 27; filed, April 29; cost $4100.

Washington near Devisadero. Two two-story frames; owner, Geo. W. Lippman, architect, J. W. Littlefield; contractor, O. E. White; signed, May 2; filed, May 3; cost $5807.

THE general rebellion now going on in the United States against bad management of our municipal governments makes an account of what can be done by a practical economical people *apropos*, such an account is concluded in this number.

In the case of the Civic management of Glasgow we have the most practical application so far made of Socialistic principles to the government of a big city. Glasgow is a city of about 750,000 inhabitants the most populous city in Great Britain next to London, and is therefore the best exhibition of an advanced municipal government that we have on a large scale. Many valuable lessons may be learned from this example.

The care taken to prevent monopolies from getting possession of the peoples' property, is one. In this case the City of Glasgow had taken the precaution to simply lease the roadbed to the Street Car Company, thus keeping control of the streets, so that when the time mentioned in the lease twenty-three years, had expired and the Company refused to accede to reasonable terms for a re-lease, the City was able to resume control of the roadbed and rails and all it had to do was to supply cars and power, which was successfully done. In the United States the people have been far more liberal in giving away and have generally given franchises for fifty years for exclusive use of the streets, thus preventing themselves during their own generation from ever again getting control of these streets except by repudiation or by running elevated electric cars on tracks over the private company's tracks and thus by

competition with them bring them to sell back their franchises to the people.

In the purchase of the Gas and Lighting plants a practical way to do so is indicated by the article—although no doubt there are still better and more economical ways of procedure: the results however show that even by the system of Bonding as carried out by Glasgow, success has been attained; and the city management is a shining example as the price of gas has been lowered from $1.28 per 1000 cu. ft. to 62½ cents—and still it pays a good income to the city.

Thus we see that whenever a proper idea of the purpose for which they exist animates public bodies, they soon find some way to remedy evils. In the words of our author:

"The Corporation recognise three duties as being laid upon them: to fulfil their trust by economical administration of the city's finances: to improve public health, both physical and moral; and to give brightness and the possibility of happiness to civic life." . . . "Beyond that, the Glasgow Corporation hold it their duty to undertake the supply of these necessaries of life—light, fresh air and pure water—*which private enterprise cannot generally be trusted to provide.*"

The experience of most of American Cities go to verify the last sentence.

"It has in short been conclusively proved that municipal management of such a business as the supply of water is compatible with a direct saving of money to the consumer and a great improvement in the supply."

"The Corporation also provide lectures upon art and kindred subjects in the museum and galleries, and give a good concert every Saturday during the winter in the City Hall, at prices of 6 cts. and 2 cts.; and they make it pay. They are now building a People's Palace in the East end. There theory is that the way to stop drunkenness is to compete in attractiveness with saloons; and, whether it be true or not, they certainly do their best to carry it out."

It is interesting to see how a Corporation that has done such good work in such a short time is organized. We fine the whole business done by Committees of the Council, and the whole power is in the hands of the Council—who are responsible for all that goes on—this appears to us as it should be, have a proper representative Council elected by proportional system of voting, and make them responsible for *all* the business of the city, and have no outside commissions or appointed independent bodies—in short a public corporation modeled on the same plan that has made private corporations so successful.

Thus we find the cleansing of the streets is under the direct control of the Health Commmittee, and we find it efficiently done. The same committee has charge of sewage farms owned by the corporation which "indicate a promising field for the labor of the unemployed."

The civic feeling that is extant throughout our country at this time is encouraging—and when such feelings as those mentioned in the articles before us, "It is a sacred charge entrusted to us, and we must be neither swayed by party or party feelings, and by looking only to what is highest and best for the general welfare of the trusts committed to us, and how we may advance through our corporate work the prosperity of the City we love so well," shall have become more common than they are now, may we look forward to a genial revolution of city affairs tending to the general prosperity and well being of the citizens.

A Single year of judicious advertising is often equal to a lifetime of hard work in the building of a business.

GLASGOW—A MODEL MUNICIPALITY.

[Continued from May number.]

It is worth pointing out that the late Tramway Company only paid a net rent of about £5,000 a year to the Corporation for the use of the streets, so that there is a direct gain in money as well as in efficiency. As an indication of the boon conferred by the introduction of halfpenny fares, I have been allowed to see a table of the average number of travellers in a typical week at the various rates. From this it appears that, in round numbers, 300,000 passengers paid ½d., 600,000 paid 1d., 95,000 paid 1½d., and only 20,000 paid the maximum fare of 2d.

It may be supposed that the next step will be to abolish all fares above the penny, a plan which will simplify bookkeeping, and leave the conductor much more leisure to attend to his passengers than he has at present. It seems to an outsider that the sensible plan would be for the Company to use its omnibuses as friendly feeders to the cars in the outlying districts, instead of running them as rivals on parallel lines, at at present. In that case, this step might follow very shortly.

The capital of the Tramway Department is provided for in the usual way, by a sinking fund which, it is calculated, will pay off the debt in thirty-one years. Altogether, I think that this history of the Glasgow tramways may be strongly recommended to the notice of all Town and County Councils whom it may concern.

One may pass next from the locomotive to the stationary, from tramways to dwellings and lodging-houses. And one must admit that a very interesting part of the work of the Glasgow Corporation is that carried out under the name of the City Improvement Trust. This Trust was established in 1866, when the problems of "over-crowding" were clamant for treatment. Its object was "to let air, light, and, if possible, a little sunshine into the dismal closes and courts of the city, where not fewer than seventy-five thousand human beings were crowed together amid surroundings that had become moral and physical 'plague-spots,' a danger and disgrace to civilisation." During the twenty-eight years of its existence the Trust has spent nearly two millions sterling in the purchase of insanitary property and in building. At first it was thought that the citizens themselves would step in and build improved dwelling-houses upon ground cleared by the Trust. That hope was not fulfilled. Those who built went in for a very different style of edifice. In 1870 the Trust itself undertook the building of a small number of tenements of one and two roomed workmen's dwellings, at rents which ranged from £5 14s. to £9 15s. per annum. Further, they built a model lodging-house to provide for some of the lodgers turned out of the vanished slums. Each inmate of this lodging-house was provided with a separate cubicle and a good bed. Dining and sitting halls, with a kitchen and a shop for the use of the men, were placed on the ground floor. The price of a night's lodging was 3½d. or 4½d. The two hundred and ninety beds were so regularly in demand that the Trust went on to build seven such lodging-houses in all, six for men and one for women. The return for the ten years 1881–1891 was at the rate of nearly 5 per cent per annum upon the total outlay. As the Corporation were meantime borrowing money at 3½ per cent or less, this was clearly a successful experiment in municipal building. But they hold here, as elsewhere, that their business is rather to stimulate private enterprise than to supersede it. One result of the establishment of the model lodging-houses is that the old style of cheap and nasty lodgings is practically extinct in Glasgow. Private enterprise has gone to work on Corporation lines, and the standard of comfort has been raised, by the simple operation of economic law, to that set by the Corporation. It should be added that the committee which manages the lodging-houses has for two years provided a free entertainment every Saturday night in each of them. These entertainments are extremely popular, and help to keep the lodgers out of the public houses.

The Corporation are at present engaged in the building of a Family Home, which is to do for widows and widowers with children what the lodging-houses have done for single men, in the way of raising the standard of comfort and the possibilities of life. In this building, which will provide one hundred and seventy-six dormitories, it is proposed to charge 8d. a night for a room large enough for a man or woman with not more than three children. The children will be fed and taken entirely in charge during the day, as it is expected, for 1s. 6d. a head per week. This, I believe, is an absolutely new experiment for a British municipality to try. If it pays its way, the example will be fruitful in advantage to a particularly unlucky class of the population.

The provision of workmen's dwellings has hitherto not been attempted on a large scale by the Trust. It has, however, built a few tenements, and is now building new ones to supply accommodations for about three hundred families, at rents from £7 5s. to £11 5s. But all this only provides for the wants of the better class of artisans, who can pay a comparatively high rent. Now plans have been approved for houses of one and two rooms, which conform to sanitary requirements, and can be built and let with profit at a rent of £4 10s. to £5 a year for one room, £7 10s. to £8 for two. When the Corporation working at the city's risk, have shown the possibility of making such a building pay, the further erection of similar tenements will be left to private enterprise, as in the case of lodging-houses. A very important class, that of labourers earning less than 20s. a week, will thus at last be provided with the healthy and cheap houses that all practical philanthropists have so long desiderated.

But a work man's leisure is not to be wholly spent in even the most healthy of homes. He and his family need recreation. The Glasgow Corporation have therefore always taken a keen interest in the brightening of civic life. Stong in "the power of multiplied penny," they have endowed their city with museums, half-a-dozed parks, and a really good art gallery. It is significant of their attitude that one of the reasons put forward for the taking over of the tramways was that additional facilities for getting out to the parks might be put in the way of the poorest citizens. In the same way, I learn that a weir is to be built across the Clyde for the double purpose of preventing the ascent of sewage from the lower reaches and of deepening the river so as to allow of boating above the weir. The Corporation also provide lectures upon art and kindred subjects in the museum and galleries, and give a good concert every Saturday during the winter in the City Hall, at prices of 3d. and 1d.; and they make it pay. They are now building a People's Palace in the east end. Their theory is that the way to stop drunkenness is to compete in attractiveness with the public-house: and whether it be true or not, they certainly do their best to carry it out. More important still, perhaps, is the fact that they are providing playgrounds for children in the congested parts of the city, where gymnastic apparatus and games of all kinds are at the disposal oi every child in the neighbourhood. Without doubt all this provision of means for recreation makes the health of the citizens. Let us see what else is done to that end.

The sanitary system of Glasgow is as justly famous as the name of Dr. J. B. Russell, the veteran Medical Officer, under whose direction it has all practically grown up. Sanitation, it has been said, generally has its root in selfishness. Thus the origin of the Glasgow Sanitary Department in 1863 can be traced to the fear felt by the epidemics of typhus and cholera that ravaged the city from 1848 onwards. The organization which now wages the continual battle against disease is at once simple and efficient, as the deputations that continually come from other towns to investigate it know.

The Medical Officer and his lieutenant, the Sanitary Inspector, are the heads of a little army of inspectors who are always acting as spies in the enemy's country. First come the epidemic inspectors, whose task has been a comparatively light one since the Notification Act was put in force. Every person attacked by infectious disease is treated, at least in theory, as a danger to the community. He is taken off compulsorily to the Corporation hospital, unless he can show that he will be properly isolated at home. There was a time when the sanitary officials were looked upon with doubt, and it was often necessary to get a warrant to remove a patient from the poorer districts. It is still so in some towns where the plan of using the police as sanitary inspectors is adopted. Dr. Russell has steadily set his face against this practice, and the result of his wise rule is that the people now have absolute confidence in "the sanitary men," who are allowed to go freely where neither police nor even missionaries may penetrate. Further, the community have recognised that if they insist on taking a man to a hospital for their own sake rather than for his, it is only fair that his stay there should be made as enjoyable as possible. The consequence is that the average Glasgow labourer now regards hospitals in much the same light as Maggy in *Little Dorrit*, who was occustomed to say, "Such beds there is there! such lemonades! such oranges! such d'licious broth and wine! such chicking! Oh, AIN'T it a delightful place to go and stop at!"

A second staff of inspectors are engaged in detecting nuisances. A third staff, again, look out for cases of overcrowding. Any house not exceeding 2,000 cubic feet in total capacity and suspected of offending in this respect may be "ticketed," as the phrase is; that is, marked outside with the maximum number of persons that may be safely allowed to sleep in it. The inspectors have authority to enter any ticketed house at any time, and so check the overcrowding which is fruitful in disease among the very poor. In very bad cases of insanitary conditions a house can be closed althougher. Here as in regard to epidemics, the motto of the department is "Prevention is better than cure."

The supervision of workshops, dairies, etc., and the administration of the Shop Hours Act are also in the hands of the Sanitary Department. One result of this is that there is no dairy in the city in communication with a sleeping or dwelling-room.

The Department employs six female inspectors, whose

duty is to act as sanitary missionaries. They go about widely among the poorer classes, and hold informal talks on sanitary questions with the women of each neighbourhood. These ladies can gain confidence and advice on delicate matters in which "man, proud man," would find himself quite powerless.

The cleansing of the two hundred miles or so of Glasgow streets has also been placed under the control of the Health Committee, since it was found that cleansing and the prevention of cholera go hand an hand. Much time and friction are thus saved, and the work is efficiently done at a moderate cost. The business of sewage purification is also attached to the Sanitary Department. For many years the four condition of "that navigable river, the Clyde" (as one of their own poets has said), has been a disgrace to Glasgow. Works have recently been brought into operation for dealing with one-fifth of the total sewage of the city. At present their effluent into the Clyde is as clear as Loch Katrine water itself, and has no smell. The process will speedily be extended to the rest of the sewage, and the day may not be far distant when salmon will again be caught at Glasgow Bridge. The solid product of the sewage is in part sold to farmers and in part used on the Corporation's own farms. One farm, which was originally leased as moss-land worth 1s. per annum per acre, is now valued at 30s. per annum. This indicates a promising field for the labour of the "unemployed," for whom the Corporation have been forced to find work in more than one of the severe winters of recent years.

No account of the Sanitary Department of Glasgow would be complete which did not allude to the public baths and wash-houses, though these are nominally under different control. Glasgow believes in soap and water. At present there are five public boths and wash-houses in her thickly populated districts. It is felt that this number is inadequate. Experience shows that the average house-wife, though she is glad to take advantage of a wash-house, will not carry her dirty cloths more than half-a-mile. Thus the five wash-houses now existing are used by only about 3,000 women in a year, each of whom goes once a week, and can do her week's washing for 5d. But there is need of many more wash-houses, and it is hoped that in time there will be one at each corner of every square mile in the city, so that few women will need to go more than half-a-mile to their week's washing. The baths and wash houses have not as yet paid their way. There is a small annual deficit to be met by assessments. It is worthy of note that the Corporation have opened the baths free at certain hours to children attending the board schools of the city. The teaching of swimming has thus been greatly encouraged.

But what one may here ask, does Glasgow pay for all these good things? It is obviousiy impossible to go into matters of finance, except in the most general manner. The first question is naturally that of rating. The municipal rates, covering all the departments that have been mentioned, and much more that must be taken for granted, are given, as they were in 1874–75 and as they are in the present year, in the following table:—

Year.	Rate per £ on rental of £10 and upwards.	Rate per £ on rental under £10.
1874–75	3s. 02½d.	2s. 3¼d.
1894–95	2s. 8¾d.	2s. 1 9-32d.

(A rate of a penny in the pound now produces about £15,000.

In the same period the price of gas has been lowered from 5s. 3½d. per thousand cubic feet to 2s. 6d. These figures show that in spite of the increase of the population and the doubling of the area of the City of Glasgow between 1874 and to-day, the rates have decreased all around, whilst the service is substantially improved.

A typical instance of the financial methods which have allowed this to be the case is to be found in the erection of the present municipal buildings. Glasgow's stately and even magnificent *Hotel de Ville* cost something over half a million sterling. A penny in the pound had been added to the assessments in 1868 to pay for the old City Chambers. This was not thereafter taken off. It is sufficient, with the rent contributed by the departments, equal to about ½d. in the pound on the rates, to pay the interest on the cost of the new buildings, their maintenance, and the Sinking Fund. This will pay off the entire debt of over half a million in fifty-six years, when the buildings will be the unencumbered property of the city.

If I were asked, indeed, to state the distinctive feature of Glasgow finance, I should suggest the Sinking Fund. That useful invention is now applied to every enterprise of the Second City. On examining the municipal accounts, one finds that all serious debts are on the way to be cleared off by the automatic operation of this device. Thus the Loan Debt of the Police Commission, amounting to nearly £1,300,000, will be paid off in less than fifty years, four-fifths of it being paid within twenty years. The water and gas debts will be paid, the one in sixty-seven years, the other in forty, without any new call upon the ratepayer. The debt on the parks and galleries will be paid off in forty years, and that on the tramways in thirty-one years.

The present financial position of Glasgow seems, to an outsider, extremely satisfactory. Roughly, one may estimate that her liabilities are eight millions sterling and her assets ten and a half millions, with a clear balance of two and a half millions sterling on the right side of the account. It is clear that, with all her Sinking Funds at work, Glasgow is on the high road to riches beyond the dreams of even municipal avarice. Whatever experiments in municipal collectivism her Council may desire to undertake in the future are at least not likely to be hampered for want of funds, or to fail through lack of business capacity.

Before I finish this sketch of some features of municipal Glasgow, I should like to draw attention to one subject of special interest for Londoners at present, upon which Glasgow may throw some light. It is generally felt by the citizens, as well as the Corporation, that the City of Glasgow, covering as it does, since the extension of the boundary in 1891, almost 12,000 acres, with a population of upwards of 700,000, is tending to outgrow its unity. General municipal *esprit de corps* needs to be fostered in the several districts now knit into one city. At the same time it is strongly felt that only a central authority can deal effectively with such questions as those of sanitation, sewage, police, fire, and so on. A re-arrangement of the wards of the city will be called for next year, and it is highly probable that some scheme of Divisional Committees will then be adopted, without any weakening of the central authority. By the courtesy of a member of the Corporation I am enabled to give the gist of such a scheme, which he has drawn up for submission to the Council. It seems almost certain that this scheme, or something very similar, will be ultimately adopted. The Unification Commission might do worse than consider carefully its provisions, which begin as follows:—

"The object of any scheme of divisional administration should be: (1) To keep alive municipal interest in all parts

of the city by providing some machinery, other than that of the central body, by which local wants and necessities could be ascertained and supplied; and by which local feeling would find more full and complete expression; (2) To relieve the central administratice machine of certain details by having a first process of selection and preparation of business, which would leave the central body more free to deal with the matured recommendations of the district, and with all questions of principal and general policy.

"Any scheme of divisional administration to be successful must comply with the following conditions:—

"(A) The central control over the various departments must be maintained, so that consistency and uniformity of policy and action may be kept throughout the whole territory.

(B) Income and expenditure and the employment of officers of every degree in all branches of the service must rest with the central body.

"(C) The representatives composing the divisional bodies must all be members of the Central Council.

"(D) The power to regulate, diminish, or increase the powers and duties of the Divisional Boards from time to time, as experience and utility suggest, must rest entirely with the Central Council."

The scheme then goes on to propose that Glasgow should for this purpose be divided into five sections, "so as to give the nearest effect to natural geographical groups that the limits of the wards will permit." A Divisional Board is to be formed in each section, of the members elected by the wards contained in it, with others if necessary; the Lord Provost, and the Conveners and Sub-Conveners of the Committees of Watching and Lighting, Statute Labour and Health, to be *ex-officio* members of each board. The minutes of each board-meeting are to be communicated to the next meeting of the Central Council, and, if not disapproved thereon become resolutions of the Council. Provision is made for holding at the disposal of each board of the services of officers from the chief administrative departments, especially acquainted with the territory of the board. The The remaining provisions are as follows:—

"8th. The work of the Board would be to receive, consider, and deal with remits from the Central Council, or any of the standing or special committees thereof, to receive and consider complaints or suggestions from the ratepayers in the districts relating to the public service, to inquire into these, and discuss or make recommendations, and to discuss and mature any improvements or changes in the service of the various departments for recommendation to the Central Council through their standing committees; to report on the requirements of the district previous to the preparation of the annual estimates, and to take a special oversight of the repair and upkeep of streets and sewers, the cleansing and lighting of streets, the removal of refuse, the placing of fireplugs, etc., and the inspection of nuisances within their districts.

"9th. For the proper regulation of the business of the Divisional Boards, Standing Orders should be drawn up by the City Council, providing *inter alia* for a direct appeal to the Council, on the request of two-thirds of the members of the Board present at any meeting, against any decision or recommendation of any Central Standing Committee affecting any Divisional Board.

"10th. It is suggested that the business of the Local Boards should be carried on at some conveniently accessible point in each district, and that, to give outward and visible embodiment to local municipal life, there should be established a Municipal Bureau or district Office, where all possible municipal business would be concentrated (such as collection of gas and water accounts, municipal assessments, etc.,) and where information, advice, and assistance could be at once obtained in reference to epidemic disease, hospitals, and the sanitary service generally, cleansing roads, drains and sewers, lighting, fire, police, gas, water, and indeed every department of the public service which affects the health, comfort, or convenience of the citizens."

The only comment I shall add is that the combined safety and elasticity of this scheme seem to me to be strongly in contrast to the rigid and risky proposal to which Mr. Chamberlain recently saw fit to give the weight of his great authority.

It is hardly necessary for me to point out, in conclusion, that I have of necessity forborne to deal with much that is important in the municipal life of Glasgow. Upon the work of the police and the fire brigade, the Dean of Guild, who supervises building, the profitable Markets Trust, with its control of the meat market and slaughter-houses, and many other parts of the Corporation's business, I have no space to touch. Otherwise I should like to glance at the principle recognised by the Corporation, to do their own work by direct employment of labour in certain cases, such as in the repair and cleansing of the streets, but to employ contractors in other cases, as in bridge-building and street-making. I should especially like to call attention to the grim irony of circumstance which causes a city, so advanced in other respects, to be about the last in the country to offer its citizens a Free Library, and makes a Council, who play lightly with millions when it is a question of material boons, shrink from asking their constituents for a penny in the pound when it is only books that are needed. Probably they have delayed thus long only in order to acknowledge, by one frailty, that they too are human; but an outsider may assure them that they will provoke no envy of the gods if they can make up their minds to force this crowning benefit upon their citizens.

It is true that the Glasgow Corporation have lately been accused of an over-readiness to "force benefits upon their citizens." But the principal Police Clauses of their Bill now before Parliament, of which facetious members have made their sport, have been the public law of Scotland since 1892, and are now merely being adopted by Glasgow. The facetious gentlemen are, therefore, surely a little late.

But I must turn to consider the lessons that Glasgow has to offer the rest of the country, for I think I have justified my title. That, indeed, is a business that the gentle reader can do best himself, if I have been at all successful in my transcript from life. I wish to offer him only two suggestions.

The first is that Glasgow is an instance of the striking progress which may be achieved in municipal matters by a body of good business men who are more concerned about the welfare of the city than the illustration of a political or social theory. Politics, indeed, are practically unknown at the Glasgow Council Board. Nor is eloquent speech in great demand there. The real work is, all of it, done in committees and small sub-committees, and the discussions at the meetings of council are, I understand, chiefly useful to let outsiders know what is going on. Glasgow, again, is claimed by many as a wonderful example of the success of municipal socialism. That may be so, but the Council certainly had so such idea in their heads when they achieved their successes. The method of the Glasgow Corporation, who have done their work solely on the principal of finding the best thing for the citizens in each matter, may be profitably contrasted with that of bodies which begin by enunciating a political or social theory, and then spend so much energy in arguing over it, that they have none left for applying it. Municipal collectivism may have achieved great things in Glasgow, but her Councillors have been col-

lectivists—as M. Jourdain talked prose—without knowing it, or at least without caring about it:

"Like some tall palm the mystic fabric sprung."

In the second place, it is gratifying to note how completely the Glasgow Corporation has fulfilled the conditions deduced by Mr. Chamberlain from his Birmingham experience.

"The municipality is ever present; it is the active centre of all public life of the town; its members are perpetually striving strenuously to promote the good, the happiness, and welfare of the whole population. . . . The City Council are the directors of a great co-operative undertaking, in which every citizen is a shareholder, and the dividens are payable in the better health, in the increased comfort, in the recreation, and in the happiness of the whole population."

This is surely a higher conception of the duty of a corporation than those have formed who attempt to bolster up a political or social theory by their municipal practice. It agrees with that of the Lord Provost of Glasgow, who says, for himself and those who share his authority:—

"It is a sacred charge entrusted to us, and we must neither be swayed by party nor party feeling, ... looking only to what is highest and best for the general welfare of the trusts committed to us, and how we may advance through our corporate work the prosperity of the city we love so well.

When that is the temper in which our municipal affairs are administered, there is no need to wonder that Glasgow is a model municipality, and has traveled a measurable distance on the road to become "the ideal city, in which a pleasant and healthy home is within the reach of every citizen."—*Garret Fisher in The Fortnightly Review.*

STEEL BUILDINGS.

THE advantages of this method of construction over any other is well exemphfied in the case of the Carter building, says the *Boston Commercial Bulletin*. It is stated with authority that the space saved over the old method is worth in rent about $12,000 per annum. Where land is very expensive or where lots are small the steel structure is particularly practical as it permits the saving of considerable interior space is always a matter of great importance.

In the modern steel structures masonry counts for very little, as the weight of the building is borne by columns. Such is the importance of the steel work that goes into these buildings that the greatest care is taken in its manufacture. The best architects and knowing builders see that every piece of steel is carefully tested and if not up to the standard it is thrown aside. The method of testing is a most severe one. The experts are hired and controlled generally by the architect at the cost of those who put up the building: the expert is stationed at the mill. Of such a nature is the work that two concerns in Pittsburgh are making a specialty of furnishing experts to supervise it and are doing the principal work of this character in the country.

It is required of these experts that they thoroughly test each piece of iron and steel made in the mill, or in other words, physical tests are made of each melt. The test specimens should fill the following requirements: Ultimate tensile strength, from 60,000 to 68,000 pounds per square inch; elastic limit, minimum, 35,000 pounds per square inch; elongation in 8 inches, minimum, 25 per cent; reduction in area, minimum, 40 per cent. In the bending test it is necessary that the iron or steel bend 180 degrees flat around a curve whose diameter equals the thickness of the specimens without a sign of a crack on the convex side. These tests alone signify the high standard of the material used, and when one considers how slender the modern steel frames are that hold up our buildings, the reason for this care can be easily understood. An expert also sees to it that properly marked pieces are put into the buildings, and those without proper marks are thrown aside. These experts are paid so much per ton, and make report to architects. Great care is taked that steel does not contain more than 1-10 of one per cent of phosphorus.

In steel frame construction the skeleton of the building is generally erected first, before the masonry is started. Under the old method the iron and masonry were used together in the building of each story. Where bolts were used largely in the last mentioned form, the steel sections are riveted almost wholly in the first. A steel thus riveted can be compared to an inverted bridge, for in fact the modern building is built on the bridge plan, and it is rivited in such a manner as to make it, to all intents and purposes, one piece of steel from top to bottom. Thus any strain which may be put upon the building will be shared by the structure as a whole and not confined to any one spot, as in the ordinary building.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
OCTAVIUS MORGAN, PRES. A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec't. AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

BOOKS AND PERIODICALS.

SAN FRANCISCO BAY AND VICINITY.—We are indebted to the Union Photo Engraving Company for a handsome map, published by the above company. We understand this map was modeled in clay, and is certainly a very creditable work that should adorn the walls of every business office in the city.

KIDDER'S ARCHITECTS and BUILDERS POCKET BOOK, published by John Wiley Sons, 53 East 10th street, New York, price $4.00. We know this is considered a valuable book by some one, as it was stolen from our letter box before it reached our desk.

THE FORTNIGHTLY REVIEW for June contains an interesting sketch of "Mr. Chamberlain's Municipal Career." Mr. Chamberlain, at present a member of Parliment from Birmingham, twenty years ago was Mayor of that city, when after much opposition his plan for the requirement of the gas works by the city corporation, as afterwards the water supply of the city, which proved a great benefit; both these projects proving a great success and giving a large revenue to the city, at the same time reducing the cost to the company about one-third in the cost of gas, while double the supply of water was furnished.

THE BROCHURE SERIES OF ARCHITECTURAL ILLUSTRATION. Published by Bates & Guild, 6 Beacon street, Boston, Mass. The Brochure Series in its present form is a continuation of the little occasional circular of the same name already well known to the architects of the country. The favor with which these were reviewed has induced the publishers to establish a regular monthly publication at the low price of fifty cents a year. In regard to the illustrations what the publishers claim is true, viz: "Photographs of the size here given cost from fifteen to fifty cents each . . but in the present form they cost but one-half cent each and for all practical purposes are quite as valuable as the originals."

We take pleasure in presenting our readers an illustration from MODERN OPERA HOUSES AND THEATRES, a work about to be published in London by Edwin O. Sachs, Architect F. S. S. and A. E. Woodrow, Architect A. R. I. B. A., Waterloo Place Pall Mall, S. W. Illustrated by a series of 220 plates from drawings prepared for the work. The design below is the entrance to "D'Oyly Cartes Opera House."

ENTRANCE TO D'OYLY CARTES OPERA HOUSE.

POINTS IN THE INSPECTION OF ELECTRIC PLANTS.

IN a recent paper on points in the inspection of electric plants, read before the Fire Underwriters' Association of the Pacific, Mr. G. P. Low made a number of excellent suggestions. One of his most pertinent remarks was the following: The greatest enemy to safety in wiring is moisture, and the only flexible and durable material having high insulating qualities that will withstand moisture is rubber, or the compounds allied to it. These should be used exclusively for the insulation of all inside wiring, despite their inflammability. Wires should never be permitted to touch anything save their insulating supports: hence it follows that insulating tubes or bushings must be used wherever wires pass through walls, floors or partitions of any description. The hazard of wood base cutouts, switches, etc., is so well understood, that there is no occasion for making further effort to show the necessity for invariably ordering their immediate removal.—*Architects' Electrical Bulletin.*

THE DISPOSAL OF DUST.

HITHERTO the disposal of house dust and general refuse has been a matter involving considerable difficulty for municipalities, and always, even under the most favorable circumstances, one of the most costly items presented to the ratepayers in the parish bill. Thanks, however, to the public spirit displayed by the majority of the members of the St. Pancras vestry, says *Lloyd's*, and the skill of their engineer and chief surveyor, Mr. W. Nisbet Blair, the difficulty has been conquered, and this great metropolitan parish is about to show, not only how to get rid of its refuse at the lowest possible cost, but how to make the heretofore despised waste of commercial utility. Two years ago it was seen that the success attending the establishment of the parochial electric lighting works would necessitate an early enlargement of the scheme, and it was then that Mr. Blair proposed to the electrical engineer, Professor Henry Robinson, a plan for burning refuse in special destructors and utilising the heat for the generation of the power required. Together the two gentlemen formulated a complete scheme, and laid it before the vestry, which for a long time refused to be convinced that it was feasible, but at length perceived its advantages, and having adopted it pushed on the work, which is now rapidly approaching completion.

The buildings cover an area of about two and a-half acres, running from Georgiana street to Pratt street at the back of Great College street, and facing the King's road. Their most conspicuous feature is the great chimney built by Messrs. Kelly Bros., of Liverpool, and stated to be one of the most perfect pieces of work in the kingdom. This gigantic shaft, octagonal in shape, and faced with ornamental lines of rost-red Ruabon brick, rises from a bed of concrete eight feet thick, and twelve yards square, to a hight of 231 feet, its altitude from the ground level being 207ft. 6in. At the base the brickwork has a thickness of five feet, and this is gradually reduced until immediately below the stone cap it is only 14 inches. The caps weighs no less than 32 tons 11 cwt., and the total weight of the whole shaft is 2,680 tons. A lining of fire-brick goes to a height of 78 feet, and between it and the main shaft is a three-inch cavity, to prevent the outer brickwork suffering damage by heat. When plumbed it was found to be less than a quarter of an inch out of the true perpendicular, an accuracy so rare as to be phenomenal. The cost of erection was 3,400*l*. The rest of the work has also been carried out in the same thorough fashion, and its details are full of novelty and interest. The refuse will be taken in through an entrance in Georgiana street, and there weighed and tipped into enormous tanks on each side of the main shed. To these tanks are attached hoppers, which convey the dust to furnaces underneath specially constructed to Mr. Blair's design, and regarded as the most approved type in existence.

The great feature of the whole scheme is its general automatic power, which enables it to deal with an enormous amount of matter, while necessitating but very little manual labour in proportion. This feature is specially exhibited in the furnaces, which are fitted with most ingenious appliances, the patent of Mr. Healey, an engineer, of 24 Queen Victoria street. The dust falls from the hoppers on to bars, arranged somewhat in the form of an enormous gridiron. Alternate bars move continuously up and down with an eccentric forward motion, carrying the refuse to the centre of the furnace. This motion is obtained by means of a special engine, the boiler of which is heated by the fumes of the burning dust which thus assists its own destruction. The same boiler also drives the blowing machinery, by which the draught is obtained to ensure combustion, a mortar mill, and a stone-breaking machine. There are eighteen furnaces in all, capable of consuming 1,260 tons of refuse per week, and leaving behind only a certain amount of "clinker," which is withdrawn every six hours, and which, owing to its properties of making an exceptionally tenacious mortar, will fetch by sale something like 1,000*l*. per anum. In the electric light department, which has been arranged by Prof. Robinson, there are at present three boilers—though provision has been made for six to meet future contingencies—which are heated by the destructors. The fiery gases from the burning refuse pass through a flue—the longest section of which is 60 feet—to the boiler-room, round the outer shell of the boilers, descending again to the main flue, then to the front of the boilers, through a heat economiser, and into the chimney. It is calculated that the destructors will produce 12,000 degrees of heat, giving from three to four hundred horse-power with the three boilers. A novel arrangement of balanced dampers governing the various flues enables the heating fumes from the furnaces to be turned off or on to any portion of the works, or sent direct to the chimney shaft by the mere turn of a lever. Much smoke will also be avoided by combustion chambers above each furnace, which becoming white hot, will destroy all sooty particles in the vapours before they pass into the flues. In case extra pressure should be put upon the lighting department the boilers have been so arranged that they may also be fired by hand or mechanical stokers with coal, so that steam may be quickly raised to meet any emergency. The present plant is designed to serve 10,000 lamps.

"Efficiency with economy" seems to be the motto of the designers of this great enterprise, and on every hand are arrangements for securing it. For instance, water which is supplied by meter to the works might have proved a serious item of expenditure, but is ingeniously prevented from becoming so. The waste steam from the boilers passes through a condenser and then through a water-softening apparatus to a vast tank below, which has a holding capacity of 115,000 gallons. The water at the top of the tank attains to a heat of about 110 degrees, and this is pumped up to a cooling apparatus at the top of the building, whence it returns and re-enters the tank at the bottom, thus being used over and over again.

At present the vestry pays 3s. 6d. per ton for the cartage of its refuse away. On this item of cartage alone there will at once be a saving of a shilling per ton, which, with the revenue derived from the sale of the "clinker" mortar, will show a total saving to the parish of close upon 5,000*l*. per annum. There will also be a great saving in coal at the Stanhope street Electric station, as the new station will switch on and take the entire dayload by means of the destructors alone. What this means will at once be apparent when it is stated that the Stanhope street plant already returns a profit of six per cent upon the original outlay of 100,000*l*., while the ratepayers have the advantage of better street lighting, the possession of a valuable asset, and the satisfaction of knowing that they have not had to pay a farthing for it. And better things are in prospect with the inauguration of this new scheme. The possibilities of the use of refuse as fuel are endless, and the initiative may be followed by results as valuable and amazing in the case of "dust" as they have been in that of the once equally-despised coal tar. Nothing can exceed the energy with which the scheme has been forwarded—Mr. Blair and Professor Robinson carefully overseeing the carrying out of the designs for which they are responsible in their several departments with the assistance of an able lieutenant in the person of Mr. G. A. Ellt, the clerk of the works.

LEGAL DECISIONS.

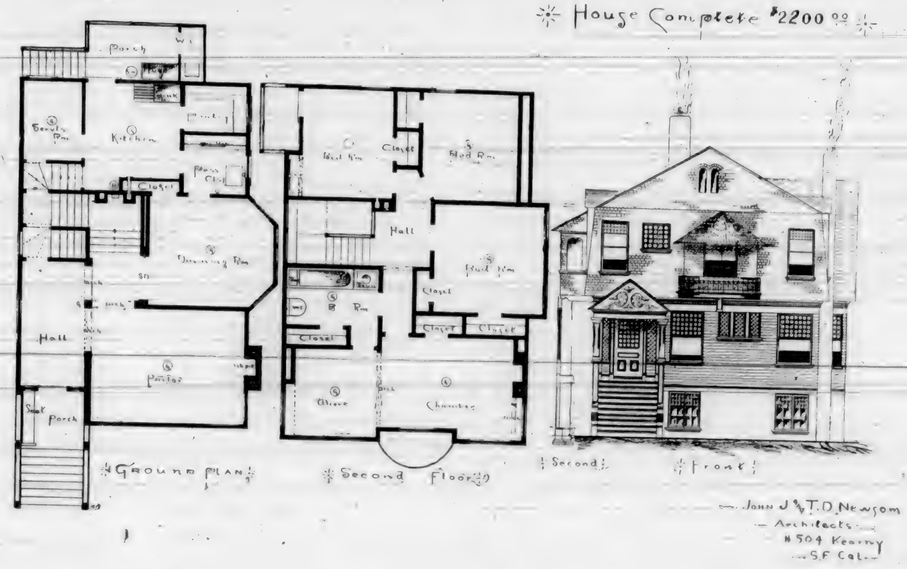
From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Payment of Contractor by Check.—Where parties upon being sued by a contractor alleged that they had given him a check in full payment of all claims under the contract, and a statement to that effect appeared on the face of the check; but the contractor denied that he had so accepted the check, and testified that the one who gave it to him told him that he would receive a further payment, and that the supervising architect advised its acceptance, saying that they would pay him in full afterwards, and this was corroborated by the architect, the Supreme Court of Washington held that the question of whether the check was given and accepted as full satisfaction was for the jury to determine.

Megrath v. Gilmore, 39 Pacific Reporter, 131.

Order by Contractor and Mechanics' Liens.—After a contractor had given a subcontractor an order on the owner, he abandoned the contract, and the owner completed the building under a clause authorizing him to do so in default of the contractor, and to deduct the cost of completion from any moneys due the contractor. The order had been presented prior to the filing of any liens. And the Supreme Court, 1st Department of New York held that such order was an assignment for so much of the balance due the contractor, after deducting for cost of completion, and was entitled to a preference over liens not filed until after its presentment.

Murry v. Micolino, 31 N. Y. S. Reporter, 1109.



Equitable Lien for Building Materials.—A contract for the purchase of materials to be used in the construction of a house, and notes given for the price, reserving title in the seller until payment, who is thus deprived of a lien under the statute, and also cut off from an action at law until the notes are due, creates an equitable lien on the house and lot which may be enforced in a court of equity.

Rose v. Perry, Supreme Ct. Ala., 16 So. Reporter, 915.

Enforcement of Mechanics' Lien.—Where the purchaser of land on which there is a mechanics' lien agrees to pay it off and save his grantor harmless as to same, the lien may be enforced against the land in the hands of the purchaser, without first exhausting the lienor's remedy against the grantor.

Cullers v. 1st. Nat. Bank, 9t. Civ. App. Tex. 29 S. W. Rep. 72.

Damages for Breach of Contract.—Where two parties have made a contract, which one of them has broken, the other must make reasonable exertions to render his injury as light as possible; and he cannot recover from the other damages which might have been avoided, had he performed such duty.

Uhlig v. Barnum, 61 N. W. Reporter, 749.

Presumption of Negligence in Erecting a Building.—Where a person lawfully upon a sidewalk is injured by material falling from a building in the course of erection, and it appears that the sidewalk was not covered or in any way guarded, it is sufficient to raise a presumption that the builder was negligent. This rule is necessary for the protection of those having occasion to use the sidewalks of public streets. The evidence as to how the accident occurred is most usually within the knowledge of the builder and his employes, and the person injured has no means of proving precisely how or why the accident occurred. The first warning of danger that he has is his injury, and then he has no opportunity to investigate the cause.

Dohn v. Dawson, Supreme Court, 1st Dept., 32 N. Y. S. Reporter, 59.

Statements in Mechanic's Liens.—Where a contractor constructs a building as one job, for an entire price, under a special contract which is not in writing, the petition to enforce his lien need not set out in detail the material furnished and the work performed.

Texas State Fair Ass'n v. Caruthers, Court Civ. App. Tex. 29 S. W. Reporter, 48.

BUSINESS MOSAICS.

Open Doors—"There are no secrets in making the best goods," is the title of the latest advertisement issued by Messrs. N. & G. Taylor Co., Manufacturers of American Tinplate, Philadelphia. This house has long been noted for its novelties in trade literature, but the present circular is something above the ordinary, and is quite original and striking. It conveys at once its meaning.

The reader is confronted with the massive double doors of a factory above which is the inscription "Open Doors", and underneath the words "There are no secrets in making the best goods." These two doors open at the touch, and bring immediately to view the interior of Messrs. N. & G. Taylor Co's. tinning-house. This is a re-produced photograph by the half-tone process, and shows in reality the workmen, the tinning stacks, tin racks, dusting boxes, etc. This Tinning House is the largest in the United States, and as the firm states, "with facilities to produce every grade of bright or roofing tin that is made."

Twenty-two tinning stacks are shown that give an output of over 9000 boxes weekly by day work alone, but the most important thing that strikes the eye, is a large hand printed in bright red, pointing to the tinning stacks at the right foreground of the picture to which is inscribed "The Genuine Taylor 'Old Style' brand is made in the stacks shown on the right; nôtice there is no shafting or machinery, the work being done entirely by hand, the same as in 1830, and here the "milk in the cocoanut" appears, and the whole import of the advertisement is quickiy apparent.

In these days of mysterious manufacturing of Roofing Tin, N. & G. Taylor Co. boldly step forward and frankly invite inspection of their product. "Our doors are open, there are no secrets in making the best goods." Their celebrated brand, the Genuine Taylor "Old Style" brand of Roofing Tin is made in tinning stacks that show no shafting machinery or rolls. The work is done entirely by hand, the same as in 1830. No acid flux is used to injure the black sheets, pure Palm Oil only being employed. These sheets are allowed to soak, and are literally "boiled in oil" before they receive their metal coatings. Made in this way, without any secrets, and with "Open Doors," Messrs. N. & G. Taylor Co. may well advertise the brand which they originated so many years ago, and which they to-day hold as without a peer above their competitors. Jealousy and competition may go far in these days of close rivalry, but their brand, the Genuine Taylor "Old Style" is to well known and established in the hands of honest roofers to need any further encomium to praise its worth and durability.

The Maid—"There were four flies on the cake you sold us yesterday." Confectioner (to clerk)—"Give the lady four raisins."—*Echo.*

San Francisco Gas Light Company, Gas Stove Department. By referring to page ii of this journal it will be seen by their advertisement that no charge is made for placing their stove, while the prices have been so much reduced for the stoves that there remains no excuse for the householder not to add this useful, and economical cooking arrangement to his outfit. We are aware among many who have not given much attention to the subject, that there is a false idea that gas costs too much when used for cooking purposes. If a little care is applied in its use, it will be found not only cheaper than the use of coal, but a great saving of time, with a great increase of comfort to the housekeeper. At 226 Post street, San Francisco, you can see the stoves and find out all about their use.

Whizly—"One swallow does not make a summer." Sizly—"No, but one grasshopper can make a spring."—*Phildelphia Inquirer.*

If you need water only when the wind blows; if you are satisfied to utilize but a small fraction of the water in your well, if you prefer heavy bills for repairs after each storm in winter, by all means use a windmill; but if you want water at any time, and up to the full capacity of your well, put in the Ajax Coal Oil Gas Engine, the latest thing in mechanics, an engine that uses common coal oil for fuel, and is built by the well known firm of Palmer & Rey, San Francisco, Cal.

"Was he very much cast down after he'd spoken to papa? "Yes. Three flights of stairs."—*Punch.*

P. & B. Paper is the only Building Paper manufactured on the Pacific Coast, and that, moreover, it is manufactured exclusively of materials produced on the Coast. Its quality has been so thoroughly demonstrated that it now almost exclusively used on all first-class buildings that are constructed in San Francisco and elsewhere. In price it is no higher than the ordinary grades of eastern Building Papers. We believe preference should be given to it on all occasions where Building Paper is specified, as every dollar spent for it means just so much more money kept in circulation at home. Their place of business is at 116 Battery street, San Francisco.

Did you make a hit with that red tennis blazer of yours down on the farm?" "Did I? It struck the bull's eye the first time I wore it."—*Indianapolis Journal.*

If you have to be tempted to take a bath, it is only necessary to look at the picture of a porcelain roll rim bath tub as shown on page v to make the temptation impossible to resist. The J. L. Mott Iron Works manufacture these, also every thing else in the way of perfect plumbing materials if you call upon Mr. M. S. James, their Pacific Coast Representative, room 35 Flood building, San Francisco, you can find out all about it.

As it appears to be fashionable to patronize home manufacture you have an opportunity to keep in fashion by ordering your plumbing from the establishment of Joseph Budde, 575 Mission street, San Francisco, if in want of sanitary closets you have your choice. Supreme, Pioneer, Ocean Spray, Cyclone Syphon Jet, Embo sed Front Washout Closets with Tank, Seat and Nickel-plate Flushing Pipe. They give the best satisfaction of all Washout Closets, on account of their Superior Tank and Workmanship. They have been adopted by the Palace, Miramar, Sutherland, Occidental and Grand Hotels, Mechanics' Institute, St. Mary's Hospital, and other prominent buildings of San Francisco.

CITY BUILDING NEWS.

Bryant Ave, near 21st. To build; owner, J. J. Noonan; contractor, T. C. Cochrane; signed, May 22; filed, May 25; cost $2525.

Brannan near Fourth. Granite work on church; owner, D. Nugent; architect, J. J. Clark; contractor, Thomas B. Roche; signed, June 3; filed, June 8; cost $3500.

Brannan near 4th. Slating, copper and iron work; owner, D. Nugent; architect, J. J. Clark; contractor, J. D. De Gear; signed, May 16; filed, May 22; cost $3344.

Bush near Baker. To build; owner, J. H. Hunt; architect, J. V. Hull; contractor, A. W. Goss; signed, May 17; filed, May 21; cost $1600.

Bush and Webster. Additions and alterations; owner and builder, Tim Sullivan; architect, A. J. Barnett; days' work; cost $2000.

Bush near Laguna. To build church; owner, Congregation Ohabai Phalome; architect, J. M. Lyons; contractor, Henry Rohling; signed, June 12; filed, June 14; cost $12,950.

Buchanan and Ivy. To build; owner, D. Edwards; contractors, Harrigan & Williams; signed, June 13; filed, June 13; cost $2250.

Buchanan near Hayes. To build; owner, Margaretta Johnson; architect, V. Monet; contractors, Harrigan & Williams; signed, May 8; filed, May 20; cost $3295.

Capp near 17th. To build; owner, Margaret I. McNamara; architect, F. B. Wood; contractor, Neil Molloy; signed, June 6; filed, June 8; cost $8215.

Caroline near Howard. Cottage; owner, George Heuston; day's work; cost $1000.

Church near 16th. To build; owner, L. Lame; architect, G. A. Berger; contractor, J. B. Pene; signed, May 16; filed, May 16; cost $2765.

Cherry near Sacramento. To build; owner, Mrs. C. H. Berlin; architect, Frank Mead; contractors, Dahlberg & Land; signed, May 16; filed, May 17; cost $2485.

Clement near California. To build; owner, C. B. Adams; contractor, A. J. Clunt; cost $3500.

Clement near 5th Ave. To build; owner, Geo. M. Coon; architect, A. J. Barnett; contractor, J. J. Manseau; signed, May 21; filed, May 21; cost $1400.

Clay and Locast. To build; owner, E. Dora Cutler; architects, Bugbee & Gash; contractor, D. B. Monroe; signed, May 23; filed, May 23; cost $1750.

Clementina near 4th. To build; owner, Mary Drummond; architect, H. Gellfuss; contractor, L. Cuneo; signed, May 24; filed, May 27; cost $3225.

Cliff House. Electric wiring, etc.; owner, Adolph Sutro; architects, Colley & Lemme; contractor, E. H. Frost; signed, June 1; filed, June 12; cost $1352.

Cliff House. Plumbing, marble floors, etc.; owner, Adolph Sutro; architect, Colley & Lemme; contractor, G. C. Sweeny; signed, June 1; filed, June 12; cost $2995.

Crant and Nye. Cottage; owner, Wm. McCall; architects, Shea & Shea; contractors, B. Duffey & Son; signed, June 7; filed, June 11; cost $1015.

Eddy near Broderick. Alterations add additions; owner, Otto Grundel; architects, Laist & Schwerdt; contractor, H. Behrens; signed, May 16; filed, May 18; cost $1675.

Eddy near Scott. To build; owner, Louis B. Hetty; contractor, J. J. Manseau; signed, June 14; filed, June 15; cost $3750.

Ellis near Franklin. To build; owner, Daniel Neill; architect, R. T. Clinch; contractor, P. J. Brophy; signed June 13; filed, June 13; cost $4780.

Ellis and Mason. Alterations; owner, Harriet McCarthy; architects, Shea & Shea; cost about $2000.

Ellis near Buchanan. To build; owner, Elizabeth Taylor; architect, C. R. Wilson; contractor, J. W. Saunders; signed, April 29; filed, May 15; cost $1465.

Eighteenth near Clover Ave. To build; owner, Johanna Sheehan; contractor, P. F. Lynch; signed, May 20; filed, May 21; cost $2311.

Erie near Howard. To build; owner, Margaret I. McNamara; architect, F. B. Wood; contractor, Neil Molloy; signed, June 6; filed, June 8; cost $2805.

First near Fulton. Additions; owner, H. Hunken; cost $1200.

Filbert near Jones. Alterations and additions; owner, Board of Education; architect, C. I. Havens; contractors, M. C. Brennan & Son; signed, June 6; filed, June 6; cost $15,000.

Filbert and Mason. To build; owner, Catherine Roeder; architects, Mooser & Son; contractor, L. W. Weismann; signed, May 25; filed, May 27; cost $2945.

Fillmore near McAllister; Cottage; owner, Mrs. Laura Albrecht; contractors, Marcuse & Remmel; signed, May 24; filed, June 15; cost $8800.

Fillmore near Grove. To build; owner, C. A. Worth; architects, McDougall & Son; signed, May 25; filed, May 25; cost $2785.

Fillmore near Grove. To build except plumbing; owner, August Jungblut; architects, Martens & Coffey; contractor, F. V. Steinman; signed, May 15; filed, May 21; cost $5200.

Folsom near 24th. Two two-story frames; owner, A. B. Broger; architects, Martens & Coffey; contractors, Williams & Foster; signed, May 25; filed, May 29; cost $7780.

Folsom near 24th. Plumbing; owner, A. B. Broger; architects, Martens & Coffey; contractors, Gullek & Wetherbee; cost $1050.

Folsom near 7th. Additions; owner, Mr. Murray; Carpenter, Mr. Allen; house raiser, A. T. Penchsky; cost $1000.

Folsom near 5th. Alterations and additions; owner, Mrs. Mary A. McHaffie; architect, T. H. Welsh; contractor, J. Hendry; signed, May 27; filed, May 28; cost $4550.

Folsom near 5th. Plumbing; owner, Mrs. Mary A. McHaffie; architect, T. J. Welsh; contractor, J. E. Britt; signed, May 22; filed, May 23; cost $1047.

Fourth near Howard. Excavation and concrete for four-story brick; owner, Hugh Dimond; architect, C. J. I. Devlin; contractor, Geo. Goodman; signed, May 17; filed, May 20; cost $1884.

Fourty-Eight Ave, near J. street. To build; owner, Wm. Gercke; builder, J. Heyman; cost $2500.

Geary near Octavia. Alterations and additions; owner, Mrs. Clemence Goldsmith; architects, Sailfield & Kohlberg; contractor, J. V. Hull; signed, June 3; filed, June 6; cost $4100.

Grove and Devisadero. To build; owner, Mrs. H. W. Armstrong; contractor, W. Little; signed, May 17; filed, May 21; cost $1195.

Grove near Laguna. Alterations and additions; owner, Mrs. C. W. Hall; architects, Hatherton & Ross; contractor, H. W. Pritchard; cost $1775.

Green near Mason. To build; owner, Herminie Donahue; architects, Shea & Shea; contractors, Magner & Gallagher; signed, May 13; filed, May 17; cost $4130.

Guerrero near Camp. To build; owner, Geo. Kennedy; architect, H. Gellfus contractors, Hood & Watson; signed, May 25; filed, May 27; cost $3335.

Harrison near 40th. To build; owner, J. McDermott; architect, M. J. Welsh; contractor, M. J. Feeley; filed, May 29, filed, May 29; cost $1787.50.

Hampshire and 18th. To build; owners, L. Kundson and Else Nassen; architect, L. Kundson; contractors, Wiegandt & Lassen; signed, May 24; filed, May 29; cost $1330.

Hartford near 19th. To build; owner, Michael Dolan; contractors, Marcuse & Remmel; signed, June 7; filed, June 8; cost $3000.

Haight and Scott. To build except plumbing and painting; owner, Chas. F. Doekring; architect, R. H. White; contractor, H. Behrens; signed, June 4; filed, June 8; cost $12,000.

Haight and Scott. Plumbing, etc., on three-story building; owner, Chas. F. Doekring; architect, R. H. White; contractor, E. J. Lawton; signed, June 4; filed, June 14; cost $1497.

Hoffman Ave, near 22d street. Cottage; owner, S. W. Boyston; builder, Heyman; cost $2500.

Hoffman Ave, near 23d street. Cottage; owner, A. Harge; contractor, J. Heyman; cost $1250.

Howard near 26th. To build; owner, Catherine Daley; contractor, John L. McLaughlin; signed, May 31; filed, May 31; cost $3400.

Howard, Second and Market. Excavating trenches; owner, Mutual Electrical Co.; contractor, A. E. Buckman; cost 24 cts. per lineal foot of trench, $23 each for large man holes, $19 for second size, $17 for third size.

Humboldt near Rhode Island. Cottage; owner, Mr. Hartmann; contractor, J. Bye; cost $600.

Jackson and Pierce. Concrete work, etc.; owner, Abbey M. Scott; architects, Coxhead & Coxhead; contractor, Rhody Ringrose; signed, May 4; filed, May 16; cost $4450.

Jackson and Pierce. To build; owner, Alice Scott; architects, Coxhead & Coxhead; contractor, M. C. Lynch; signed, May 22; filed, May 23; cost $4709.

Jackson near Front. Additions and alterations; owner, Hildebrandt, Posner & Co.; architect, J. J. & T. D. Newsom; contractor, H. T. Brady; signed, May 16; filed, May 16; cost $1773.

Jackson near Mason. To build; owner, Geo. H. Jacot; architect, C. M. Rousseau contractor, R. J. Pavert; signed, May 16; filed, May 17; cost $4415.

Jackson near Franklin. Excavation and concrete; owner, Henry Sahleim; architects, Salfield & Kohlberg; contractor, Geo. Goodman; signed, May 16 filed, May 20; cost $1600.

Jackson near Franklin. Carpenter work; owner, Henn Sahleim; architects, Salfield & Kohlberg; contractor, John Furness; signed, May 16; filed, May 20; cost $13,980.

Jackson near Franklin. Plumbing, etc.; owner, Henry Sahleim; architects, Salfield & Kohlberg; contractors, Ickelheimer & Bro.; cost $3845.

Jackson near Franklin. Granite work, etc.; owner, Henry Sahleim; architects, Salfield & Kohlberg; contractor, James Rae; cost $3600.

Jackson near Franklin. Plastering; owner, Henry Sahlein; architects, Salfield & Kohlberg; contractor, C. C. Morehouse; cost 1335.

Jackson near Franklin. Painting; owner, Henry Sahlein; architects, Salfield & Kohlberg; contractors, M. J. & J. J. Donovan; cost $1595.

Jackson and Franklin. Brick work; owner, Henry Sahleim; architects, Salfield & Kohlberg; contractor, J. Wagner; cost $1275.

Jackson near Laurel. Three two-story frames; owner, Chas. Clark; contractor, Casper Zwierlein; signed, June 4; filed, June 7; cost $11,709.

Jessie near 13th. To build; owner and builder, L. B. Schmid; cost $3000.

Julian Ave. near 14th. To build; owner, Mrs. Bridget Costello; contractor, R. Fahy; signed, June 10; filed, June 10; cost $1700.

Lake Merced to the bluff on the Ocean Shore; owner, Spring Valley Water Works; architect, Engineer of S. V. W. W.; contractor, A. E. Buckman; cost $4.45 per Lineal foot about 3,100 ft.

Laguna and Jackson. Heating and ventilating; owner, W. F. Whittier; architect, E. R. Swain; contractor, W. W. Montague; signed, May 10; filed, May 10; cost $2865.

Leavenworth near Glover. To build; owner, Jas. Reilly; architect, T. J. Welsh; contractor, R. Fahy; signed, June 12; filed, June 13; cost $2745.

Market near Fifth. Low pressure steam heating; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractors, G. H. Tay & Co.; signed, May 29; filed, June 6; cost $10,190.

Market near 5th. Interior fire-proof partitions; owner, Parrott Estate; architect, Pissis & Moore; contractor, A. Wanner; signed, May 25; filed, May 26; cost 12½ cents per sq. foot.

Market near Montgomery. Alterations and additions; owners, Brown Bros. & Co.; architects, Kenitzer & Barth; contractor, I. L. Binet; signed, May 31; filed, June 1; cost $1840.

McAllister and Devisadero. To build; owner, J. J. McCarthy; Sec. Board City Hall Com.; architect, Clinton Day; cost about $75,000.

Mission near West Ave. To build; owner, C. A. Clinton; architects, Havens & Toepke; contractors, Holm & Sheibley; signed, June 11; filed, June 11; cost $2864.

Mission near Main. Carpenter, plumbing, painting, etc.; owners, H. Bird and C. H. Haughy; architects, Martens & Coffey; contractor, A. McElroy; signed, June 15; filed, June 17; cost $3014.50.

Mission near Hermann. Repairs; owner, Board of Education; architect, L. R. Townsend; contractors, Holm & Sheibley; signed, May 13; filed, May 21; cost $1181.

Mission near Hermann. Heating for school buildings; owner, Board of Education; contractor, Geo. H. Tay & Co.; cost $1560.

Mission near Hermann. Painting; owner, Board of Education; contractor, Wm. Linden; signed, May 4; filed, May 21; cost $1400.

Mission near 4th. Carpenter and mill work, etc. for brick building; owner, A Wilson; architect, J. R. Miller; contractor, Woodworth Wetered; signed, May 21; filed, May 22; cost $11,400.

Mississippi street No. 429. Frame building; owner, Ernest and Charlotte Johnson; architect, P. J. Ellis; contractors, Petterson & Person; signed, May 29; filed, May 24; cost $7368.

Nebraska and Yolo. To build; owner, John J. Hickey; contractor, John D. Coleman; signed, May 29; filed, May 31; cost $3150.

Noe and 14th. To build; owner, John C. Voose; architect, C. Geddes; contractor J. J. Walsh; signed, May 21; filed, May 27; cost $4000.

Nineteenth and Guerrero. Four three-story frames; owner and builder, F. Nelson; cost $16,000.

Pacific Ave. near Webster. To build; owner, Ray Wertheimer; architect, J. E. Krafft; contractors, Gardner & Boyder; signed, May 9; filed, May 16; cost $6838.

Pine near Taylor. Concrete and iron work for retaining wall; owner, E. B. Hindes; architect, S. G. Hindes; contractors, Cushing, Wetmore Co.; signed, May 24; filed, May 29; cost $1485.

Post near Franklin. Alterations and additions; owners, Simon Newman; architect, James E. Wolfe; contractor, John Furness; signed, June 1; filed, June 3; cost $1645.

Polk near Filbert. To build; owner, Luke Burk; contractor, C. C. Blair; cost $4300.

Polk and Vallejo. To build; owner, Martin Hink; architects, Martens & Coffey; contractor, J. Bucher; signed, June 10; filed, June 10; cost $5610.

Sanchez n ar 17th. To build; owner, Frank P. Currie; contractors, White Bros.; signed, May 17; filed, May 20; cost $1900.

San Jose Road near Brook street. To build; owners, John and Mary Lally; architect, R Rechenbach; contractor, J. Kenealy; signed, June 3; filed, June 3; cost $1530.

Scott near Turk. Alterations and additions; owner, Claus Wreden; architect, W. Winterhalter; contractor, A. B. Schmit; signed, May 16; filed, May 17; cost $2465.

Steiner and O'Farrell. To build except plumbing, owner, D. J. Murphy; architects, Townsend & Wyneken; contractor, W. H. Field; signed, May 18; filed, May 18; cost $10,470.

Steiner and O'Farrell. Plumbing; owner, D. J. Murphy; architects, Townsend & Wyneken; contractor, J. Doherty; signed, May 27; filed, May 28; cost $1525.

Stockton near Lombard. Additions and alterations; owner, Ole Jorgensen; architects, Martens & Coffey; contractor, H. Behrens; signed, May 27; filed, May 31; cost $2200.

Sixteenth near Guerrero. Additions and alterations; owner and builder, L. B. Schmid; cost $2000.

Taylor and Post. To build; owners, Executors Moffenhauer Estate; architect, T. J. Welsh; contractor, A. L. Campbell; signed, May 31; filed, June 3; cost $4700.

Tenth near Howard. To build; owner, Norwegian Danish Methodist Congregation; day's work; cost $4000.

Tenth Ave. near California. To build; owner, Chas. Braun; contractor, J. Heaney; signed, May 21; filed, May 25; cost $1325.

Tennessee street No. 1711. Additions; owner, Mr. Grady; carpenter, C. Holm; house raiser, A. L. Penensky; cost $3000.

Third Ave. and Clement street. To build; owner, Mattie de Curtoni; architect, Wm. Armitage; contractor, Carls Rossi; signed, May 24; filed, May 29; cost $2800.

Twenty-Third near Douglass. To build; owner, S. W. Royston; architects, Townsend & Wyneken; contractors, Williams & Foster; signed, May 21; filed, May 23; cost $1880.

Twenty-fourth near Alabama. To build; owner, Samuel McKee; architect, Evan Woods; contractors, Westerlund & Holmgren; signed, June 6; filed, June 7; cost $1705.

Twenty-first and Valencia. Additions; owner, J. Lennon; contractor, J. O'Sullivan; cost $2500.

Union near Powell. To build; owner, Jos. Garibaldi; architect, E. Depierre; contractor, D. Ross; signed, May 16; filed, May 18; cost $2877.

Utah near 24th. To build; owner, Martin Johnson; contractor, Thomas F. Michell; signed, June 15; filed, June 17; cost $1175.

Vallejo and Hodges Alley. To build; owners, A. Gotelli and A. Lucci; architect, E. Picasso; contractor, Felice Torigino; signed, May 31; filed, May 31; cost $1600.

Varennes near Union. To build; owner, Davis Garibaldi; contractor, L. Cuneo; signed, June 6; filed, June 6; cost $2580.

Vermont near Humboldt. Cottage; owner, L. Rendler; day's works; cost $1500.

Washington near Walnut. To build; owner, W. S. Gage; architect, H. Burns; contractor, F. A. Williams; signed, May 15; filed, May 16; cost $7268.

Washington near Walnut. Plumbing, etc.; owner, W. T. Gage; architect, H. Burns; contractors, W. S. Snook & Son; signed, May 15; filed, May 16; cost $1730.

Waller street No. 309. Alterations and additions; owner, Mrs. Margaret Hooper; architect, E. C. McManus; contractor, P. J. Brophy; signed, April 4; filed, May 15; cost $1710.

Wisconsin near Napa. Cottage; owner, C. Mackentosh; contractor, J. Young; cost $1200.

York near 21st. To build; owner and builder, Wm. Hebbing; cost $8000.

The California Architect and Building News.

Copyrighted 1895, by the California Architectural Publishing Company.

OFFICE, 408 CALIFORNIA STREET, SAN FRANCISCO, CAL., U. S. A.

VOLUME XVI. JULY 20th, 1895. NUMBER 7.

A MONTHLY JOURNAL DEVOTED TO THE ARCHITECTURAL INTERESTS OF THE PACIFIC COAST.

Published on or about the 20th of each month by The California Architectural Publishing Company. The Stockholders being Architects and others interested in the profession.

SUBSCRIPTION TO THE JOURNAL, - $3.00 PER YEAR IN ADVANCE.

NOW IN THE SIXTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

THE Manufacturers and Producers Association of the Pacific Coast is doing good work in calling attention to the excellence of California manufactures and work and the undesirability of patronizing goods and work from elsewhere. And in line with the argument let us draw attention to the CALIFORNIA ARCHITECT AND BUILDING NEWS, the representative of Pacific Coast Architects. This should be certainly patronized and helped by the architects, builders and owners of this coast. It now stands on a par with any other publication of its class and price in the world—and in the general return of sense in the matter of trading with our neighbors we believe that the CALIFORNIA ARCHITECT AND BUILDING NEWS will not be forgotten either by California advertisers or by subscribers.

IT goes without saying that the proper bringing up of the rising generation is one of the most important objects before us, and to see that it is properly housed during the time that it is occupied in common education is one of the duties of the commonwealth.

To judge from the Report of the Chairman of the Building Committee of the Board of Education of San Francisco, this city is not quite up to date in this regard. From it we find that taking the school buildings generally they are not in the best condition for a proper æsthetic effect upon the pupils studying therein. Twenty-eight buildings have dirty walls and need whitening or rather tinting, as white walls should not on any consideration be allowed in a school room. Thirty-nine need painting. The playgrounds and yards

are just as necessary to be kept in good order as the buildings themselves. We find, however, that forty-two require their yards bitumenized; planking should no more be used, both on account of decay and for unevenness of surface; not good for running around on.

Proper privacy and clean sanitary appliances in the latrines are other things that tend to rear healthy and modest children—therefore crockery troughs instead of the present thirty-three wooden asphatum lined ones are required and proper partitions, etc. Again, an untidy environment to a school house has its bad effect on the characters of the young ones, therefore nine fences and gates ought to be repaired.

Next, there is no doubt but that over-crowdedness is detrimental to a proper teaching and quite a number of the school buildings are not large enough and require class rooms, principal's rooms, librarys, etc., added thereto.

Twenty-eight buildings require their roofs repaired and nine new floors. In one school the sash and glass are so bad that it is necessary to replace them—the Lincoln School needs repairs, but really a new building should be put up on the site as the present one is dark, gloomy, antiquated and a disgrace to the city. Another building according to the report is in a "dangerous condition and not fit for habitation" and the old Polytechnic School is "in a very bad condition" another is "in a generally dilapidated condition" and so on.

It seems to us good policy to spend money on works which will tend to prevent crime by aiding in rearing better young people, in fact more reasonable than to spend money in finding out, hunting up and punishing crime when it is committed; less police—more proper education.

ROADWAYS AND STREET PAVEMENTS.

OUR people begin to realize the importance of excellent roads and their value to all of our industries. The saving made on the ware and tear of our horses and vehicles, also that made by business men in the difference in time it takes to ride over a good and a poor road, and the pleasure to be derived from riding over a good road, are all points which show the need of having first-class roads.

The increased value of property generally amounts to more than the cost of building a good substantial road, and then, too, they are a standing advertisement for the community in which they are built, making the city or town a desirable one in which to reside, helping thus to increase the population and taxable property. A stranger's impression of a city or town depends largely upon the ease with which he can go from place to place in the transaction of business, or in the pursuit of pleasure. The cost of wagon transportation over the roads of France does not exceed one-third the like expense in America, it being common in rural districts to haul three tons, and in the cities from three to five tons net freight with one horse. These and many more facts the people are weighing, and the more they investigate the better it is for the whole country. This movement has already reached such dimensions that it is being agitated all over the United States, and the people are not going to allow it to stop.

Byrne says countries inhabited by the least civilized people, whose wants are supplied by nature in the immediate vicinity of their dwellings, are almost destitute of roads; hence it has come to be said that roads are the physical symbol by which to measure the progress of any age or people. If the community is stagnant the condition of the roads will indicate the fact; if they have no roads they are savages. There are many methods used in the construction of broken stone roads, and a variety of materials used for street paving, of which I will treat briefly for want of time.

As near as can be ascertained the first broken stone pavements were constructed in France in 1764. In the early part of the present century two systems were introduced into England, the first by Telford and the second by MacAdam. The name of Telford is associated with rough stone foundation. MacAdam disregarded this foundation, contending that the subsoil, however bad, would carry any weight, if made dry by drainage, and kept dry by an impervious covering. The names of both have ever since been associated with the class of roads which each favored, as well as with roads on which all their precepts have been disregarded. MacAdam omitted the foundation of large stones, claiming that it was not only useless but injurious. He was the pioneer of good roads in England, and from his name the word macadamized is derived.

Since the time of Telford and MacAdam the art of road making has been greatly improved by the introduction of rollers and crushing machines. The modern road builder endeavors to adapt himself to circumstances; he must secure a good foundation, either with the natural foundation or with the use of gravel, sand or Telford base, for without this the most expensively-built road will fail. It will not stay in position any more than a building will without a good foundation. Good drainage must be secured, the stone should be properly screened, the largest to pass a two and one-half-inch ring, the second size a one and three-quarter-inch, the third a one and one-quarter-inch, and the fourth a one-half-inch ring. The foundation should be brought to a proper grade and crown, and thoroughly rolled. The depth of stone should be varied according to the foundation and the traffic expected. If a good foundation four inches is enough; if a poor foundation twelve inches might be needed. The crushed stone should be spread in light, uniform layers, well rolled, commencing at the bottom with the largest stone, and using the smallest size for the finish. Nothing but the best quality of stone should be used; for this purpose trap rock is the most desirable, and will wear more uniformly, thus keeping a smoother surface than an inferior stone. We cannot afford to use an inferior quality of stone; it is economy to use the best.

Macadamized streets are the cheapest to build, and give good satisfaction when placed under the right conditions, namely, when the traffic is not two heavy and not confined to a narrow space. For instance, one street is always in good condition, as it has an average traffic which is distributed over the entire surface, while all of the macadamized streets in the business portion of the city, where the traffic is too heavy, are often in bad condition, and should be paved. This class of roads cost from 50 cents to $1 per square yard, varying according to the cost of stone, length of haul, depth of stone and cost of foundation. The cost of maintenance with a moderate traffic, of a thirty-foot roadway, is .013 per square yard. With a heavy traffic, where macadam cannot

be used with economy, it costs from .03 to .25 per square yard. The date of the first introduction of street pavements cannot be determined with certainty. Livy informs us that in the year 584 (about 170 years B. C.) the Censors caused the streets of Rome to be paved from Ox market to the temple of Venus. Streets paved with lava, having deep ruts worn by the chariots and raised banks on each side for foot passengers, are found at Pompeii. The first act for paving and improving the city of London was passed in 1532. Orders were issued by the government for pavements in Paris in the year 1184. In the United States, Boston appears to have been the first city to pave its streets. Drake says the paving of the public streets began very early and was made important about 1700.

STONE PAVEMENTS.

Stone in a variety of forms has been used for paving material for 2,500 years or more. It was used by the Romans in the form of large irregularly-shaped blocks; these blocks being laid on a massive concrete foundation. For solidity and durability this form is unequaled. Boston, Mass., it is recorded, had its streets paved with pebbles as early as 1663, and cobble-stone pavements were introduced into Philadelphia in the year 1718. Cobble stones bedded in sand are very cheap, but their roughness requires a large amount of power and energy to be expended in order to move a load over them; besides they do not make a good pavement, as they are so irregularly shaped that it is almost to hold them in place. They are difficult to keep clean and very unpleasant to ride over. In Brussels this form of pavement was displaced by small cubical blocks of stone, and these were used in Paris and finally came to the United States.

GRANITE BLOCKS.

Granite blocks were of large dimensions. The present granite block is of a narrow, rectangular shape, proportioned and laid on a hydraulic cement base, the joints filled with small gravel stones and paving cement. This method is practically a return to the Roman system, only with blocks of smaller dimensions. Without a doubt this form of pavement is the most durable for roadways which are subjected to a very heavy traffic. If a poor quality of stone is used, for instance those that polish, the surface becomes slippery quickly and is rendered unsafe for travel. In some cities Medina stone is used. It is not so lasting as granite, but is quite durable, less noisy and does not become slippery. Buffalo, N. Y., Cleveland and Columbus, O., afford the best examples of this class of pavement. Limestone block pavements were tried in Kansas City, but in a year or two they wore unevenly and split by the action of frost. Granite block pavements cost from $2.50 on sand foundations, with joints filled with sand, to $4.80 with concrete base and joints filled with paving cement. No satisfactory figures can be obtained for the cost of maintaining granite block pavements in America.

BRICK.

Brick is one of the oldest materials used for paving, having been used upwards of a hundred years in the Netherlands. Pavements laid fifty years ago are still in good condition. There are several brick pavements in the United States, from twelve to twenty-two years old, which are still in good condition. The general experience with this class of pavements is that is furnishes a smooth and durable surface, well adapted to moderate traffic. Many failures have occurred with this class of pavements, owing to poor foundation, defective construction and poor material. Whenever proper materials have been used, good foundation laid, with proper construction, excellent results have been obtained. Amsterdam is paved almost entirely with brick, and it is successfully used in Rotterdam, which is a commercial city. There are many ways of laying a brick pavement. A sand foundation, with joints filled with sand, cost $1.50 per square yard; laid with two courses of brick, one flatwise, with a cushion of sand and a wearing surface set on edge, with joints filled with Portland cement—this costs $2.06 per square yard. If laid on concrete base, with joints filled with paving pitch it costs $2.73 per square yard.

Bricks made from blast furnace slag have been tried, and they have been found to be durable, but soon wear slippery. Ordinary building bricks saturated with gas tar have been experimented with in Nashville, Tenn., but the results were not satisfactory. The advantages of brick pavements are, ease of traction, and good foothold for horses; yield but little dust and mud; are adapted to all grades, and are very easily repaired and kept clean; but slightly absorbent; pleasing to the eye and quickly laid. The principal defects of brick pavements arise from lack of uniformity in the quality of the bricks, and the liability of using bricks too soft which crumble under the action of traffic and frost.

ASPHALT.

In Paris asphalt was first employed for street paving in 1838, though it was not used to any extent until 1854. London introduced it in the year 1869, and it has since then been used extensively throughout Europe and in different sections of this country during the past few years. The difference between the asphalt pavements of Europe and those of America is due to the character of the materials. The former are composed of limestone rock which is naturally impregnated with bitumen, while the latter are composed of an artificial mixture of bitumen, limestone and sand. Many deposits of bituminous rock are to be found in the United States; they have been used to a limited extent. The Island of Trinidad continues to be the source of supply for the United States. The cost of construction varies from $2.50 to $4.50 per square yard. Cost of maintenance in America is placed at an average of 10 cents per square yard per annum; in London for an average of fifteen years at 21 cents per square yard. In Paris it costs about 40 cents per square yard per annum to maintain it, including the charge for renewing one-fifteenth part of the surface every year. In this country the cost of maintaining asphalt pavements is usually included in the original contract for construction for a stated term of years, and after that any repairs that are needed are made by the asphalt companies at the expense of the city, as it calls for expert work and an expensive plant.

The advantages of asphalt pavements are, that they are comparatively noiseless under traffic, are pleasing to the eye and are easily cleaned. The defects of the same pavements are, that they are slippery under certain conditions of the atmosphere, they will not stand constant moisture, and will disintegrate if excessively sprinkled. It is not adapted to grades steeper than 2½ per cent. Colonel Haywood states that in his opinion asphalt will last without

extensive repairs from four to six years, and that in the course of ten years the entire surface will have been renewed.

WOOD.

Wood pavements have been used extensively in Europe and the United States, though with different results in both countries. The experience in this country has been with but few exceptions unsatisfactory, while in Europe, especially in London, wood pavements have been used successfully and are quite popular, due probably to the thorough manner in which they were laid and the careful maintenance. The shoeing of horses and the width of tires has something to do with the wear of pavements no doubt. In some portions of Europe this matter is regulated by law, and should be in the United States. It is claimed that wood pavements absorb the filth of the street, and are very unhealthy.

DISTILLATE PAVEMENTS.

During the years 1886 and 1887 many coal-tar or distillate pavements were laid in Washington, D. C., but many of them proved unreliable. In some towns in England coal-tar macadamized roadways are made. This consists in mixing ordinary coal tar with crushed stone; it should be borne in mind that the stone used must be limestone or some soft stone, otherwise it will not wear down evenly with the tar, thus producing a lumpy surface. Concrete macadam, introduced by Mr. Mitchell, London, Eng., is composed of broken stone, sand and Portland cement, so proportioned that the space, otherwise vacant, is filled with an admixture of Portland cement. Mr. Mitchell states that the first piece of concrete road was laid in Inverness, in the approach to the freight station, in 1870. After the road had been used four and one-half years the wear was hardly perceptible.

GRAVEL ROADS.

We have miles of gravel roads in my city that are very fine in dry weather, but a few minutes rain makes the worst kind of red mud. On residential streets where there is light traffic and sand foundation it makes a fair surface, but on most of the streets where this material is in use, it would be economy to employ some other material. We have often been told of the excellent roads of Europe, which are under the government's control. On these roads a force of skilled men are continually at work making repairs, and any defect, however slight, is immediately repaired. It is not considered that the necessity for continual repairs is an evidence of poor workmanship in the original construction, but rather that an earnest endeavor is being made to keep the roadway in perfect repair. This prompt and constant repairing explains the superior condition of the roadways of Europe.

The men who have these repairs in charge are men skilled in this kind of work, and hold their positions because they are thus qualified. Politics has nothing to do with them as it has in this country. These men are removed for cause only. It takes years to teach men the art of road building and the proper method to be employed in making repairs. Generally in this country cities and towns pay for educating the men in charge of their roads and then politics removes them, but time will make this matter right. It will certainly be made right when people find that it is the only way to have good roads. All of us have much to learn in regard to road building. To a very large extent it is in an experimental stage in this country at the present time, and without doubt millions of dollars will be foolishly expended on worthless pavements. This waste of time and money could be saved to a large extent if every person who has a theory or scheme of his own would consult with men thoroughly informed on the subject.

For instance in this state (Massachusetts) we have a Highway Commission composed of three men appointed by the governor, and who are in touch with the most experienced road builders in the world. Fortunately for our state we have on this commission very bright, intelligent men who have the cause at heart. These men are workers, and are not afraid to go into the field themselves. They are well informed on the construction and maintenance of our roadways, and are in every way qualified to give sound, practical advice, and the officials of our cities and towns could not do better than to avail themselves of their advice and experience. When the people become throughly aroused on this subject they will demand and finally secure the best possible methods of construction and maintenance.

Aside from the facts quoted from well known authors I am indebted for much information to the kindness of many of our citizens who have traveled in this country and in Europe.—*William L. Dickinson in Stone.*

WHAT TO EXHIBIT IN MEXICO.

BY OTTO SCHROEDER.

AFTER fifty years of revolutions and political changes, Mexico is now enjoying peace and prosperity. The administration of General Diaz has incited confidence in Mexico's finances at home and abroad. Industry and Commerce have considerably developed during the last twenty years, export and import have doubled. The value of the exports from Mexico for the financial year 1891 was more than $63,000,000 and of the imports more than $50,000,000. Of the total exports for 1892 the United States received $50,000,000, Great Britain $15,000,000, France $5,000,000, Germany $4,000,000. There are more than 7000 miles of railroad open to traffic. The telegraph lines have a total length of 38,000 miles. The postoffice receipts of the Mexican Government were in 1891–92 $1,142,182. Navigation is practised on lakes and rivers at the coasts and across the Ocean. Mexico possesses a merchant navy of 1268 vessels and there are more than 30 excellent harbors.

Mexico's Trade with the United States increases more rapidly than it does with any other country.

In 1888–1889 Mexico received the following articles of import:

Cotton goods from United States, England, France, Germany	$7,534,089
Comestibles from United States, Spain, Italy	4,893,706
Drugs from United States, France, Germany	1,697,830
Woolen goods, from France, England, United States, Germany	1,613,186
Iron and steel ware from United States, England, Germany, France	1,510,310
Paper from United States, Spain, France, Germany, Italy	1,352,143
Silk goods, pure and mixed, from France	788,581
Linen and hemp goods, from England, France	673,029
Hardware from United States, Germany, France	658,854
Glass and porcelain from United States, France, Germany	607,727
Copper ware from United States, France, Germany	593,167
Machines, from United States	539,582
Furs from United States	414,100
Gold ware, silver ware, platin ware from United States	320,844
Arms and munition from United States	280,453
Carriages from United States	213,796
Stone and earthen ware from United States	81,816
Lead ware, tin ware, zinc ware from United States	75,069

This list shows the American exporters what they may

with profit exhibit at the International Fair, which will be inaugurated at the City of Mexico on the 2d day of April 1896. The American manufacturers must make a display of their electrical and steam machinery, hardware and tools, plated ware and cutlery, agricultural implements, rails and locomotives, well boring apparatus and pumps, pianos, and organs, railroad cars for passengers and freight, mining apparatus, silk and woolen goods, printing presses and type, books and paper, maps and globes, slates and lithographic stones, canned meats and preserves, clocks and watches, quicksilver and petroleum and a hundred other articles which Mexico does not produce herself.

Nobody ought to miss this golden opportunity. Our American Industry cannot afford to stay away from the Mexican Exposition as Spain and France, Germany and Italy are already making strong efforts for a great participation.

"The Federal Government of Mexico has liberally consented to admitting free of duties all materials and machinery to be used in the construction of any buildings on the Exposition grounds, while all goods and articles imported from abroad for the Exposition will be treated by the Mexican Government as imported "in bond" and import duties will have to be paid only in case of sale.

The exhibitors and concessionaires—those who sell foreign articles, or have hotels, restaurants, barrooms, theaters, circuses, and other shows in the foreign section, are to be exempt from all federal taxes.

A Lottery will be conducted in such a way that all prizes are to be bought from exhibitors.

The railway and steamship companies will carry exposition freight for considerably less than the regular tariff.

It is proposed to offer special premiums for the best model houses of different countries, said houses to be entirely constructed of material produced in the country which they represent.

Prizes will also be offered for large hotels which are to be erected on the American and European plans, an inducement which will certainly incite the competition of prominent architects and builders of different countries.

Concessions will be granted by special contract for the sale of souvenirs and novelties of every kind.

So it is of vital interest for the American architects and builders, the cabinet and upholstery branch, the carpet trade, the carriage and harness branch, the clothing and furnishing line, the crockery and glass dealers, the drug and paint manufacturers, the dry goods men, the iron and hardware line, the type foundries, the sewing machine makers, the slate trade, the manufacturers of textile goods, the jewelers, to exhibit at the City of Mexico.

To encourage immigration the Mexican Government has granted free introduction of constructing and repairing materials for tramways for a period of thirty years, it will give concessions for hotels free from taxes for a period of ten years and will allow a free introduction of all furniture, crockery, glassware, etc., to be used in said hotels. It has promised to a Colonization Land Co., which is now being organized at Chicago, the special concessions of free introduction of houses, implements, etc., and the liberation from paying taxes for a period of ten years.

There is no doubt, that Mexico's population will in the near future increase in the most surprising manner, and there will be a vast field for American enterprise and business speculation.

The visitors of the Exposition of 1896 will to a great extent consist of Spanish talking people. Mexico and Costa-Rica, Cuba and Guatemala, Honduras and Porto-Rico, the Argentine Republic and Brazil, Chile and Colombia, Paraguay and Peru, Ecuador and Venezuela will be represented by thousands of people, who will investigate and compare the exhibits of all nations and of all individual firms and who will form their opinions according to their experience. To exhibit in Mexico means to make a display of samples to all Latin-American States. Each American exhibit will be an advertisement for American Industry. No American firm ought to neglect this great opportunity.

SEMI-ANNUAL SUMMARY OF BUILDING OPERATIONS.

IT will be seen, that though the number of buildings has slighly reduced, the total amount for the first six months of 1895 show an increase.

FOR FIRST SIX MONTHS.—1895.

1895	No. of Buildings	No. of Contracts	Brick Building Value	No. of Buildings	No. of Contracts	Frame Building Value.	No. of Buildings	No. of Contracts	Alterations & Additions Value.	No. of Buildings	No. of Contracts	Total Value.
Jan'ry ...	2	3	$ 50,025	31	33	$ 148,880	4	4	$ 20,847	37	40	$ 219,752
Feb'ry ...	7	9	59,336	38	42	122,880	6	6	12,071	51	57	194,287
March ...	6	9	170,489	76	81	208,081	8	11	17,418	90	101	395,988

AN ALMSHOUSE INSCRIPTION.

IN front of some almshouses at Leominster, England, there is the quaint stone figure of a man holding a hatchet in his hand, and underneath there is this inscription:—

He who gives his money before he is dead
May take up a hatchet and cut off his head.

The story current in the neighborhood says that the founder of these almshouses came to want through being involved in building expenses for them, and actually had to seek refuge within their walls as one of the inmates.—*Exchange.*

GAS AND GAS LIGHTING.

SINCE Mr. W. Murdock who lighted his premises in Cornwell with coal gas in 1792, the increased use of this gas has been enormous, as the many millions of tons of coal consumed in its manufacture prove, but even in the early days of its use there were found many old fogies who promised all kind of evil would follow if the use of gas was allowed. More than one hundred years have passed and we find the old fogy still busy at the same old cry of danger in its use to the health of the user; thousands of those at the present time know better by their personal experience and enjoy the luxury of cooking and heating their rooms by its use; the old fogy still lives and croaks however.

THE NEW FRENCH HOSPITAL.

SUNDAY, June 30th, the French Hospital was open to the public for inspection. We think no one of the many thousands that passed through the gates on that day but felt fully rewarded for the trouble of a trip to Richmond. From the reception room through the various wards, into the operating room and last though not least to the famous kitchen with its magnificent range (we say magnificent because it struck us that way upon the first glance), visitors were allowed perfect freedom to inspect and admire the various departments, and many comments were heard upon all sides upon the thoughtful care that must have been displayed by the designers and directors of this most benificial and useful addition to our city, with the thought that generations yet unborn will rise to repeat the praise of the gentlemen who with such untiring perseverance have provided such a blessing to the community.

Each visitor was presented with a beautiful souvenir programme of the New French Hospital containing a history of the French Mutual Benevolent Society, the various illustrations in this souvenir give excellent views of the new buildings as seen from Point Lobos avenue, from 5th avenue as well as interior of main court and various other interior views of the wards and other rooms of interest.

Our space will not permit us to do justice to this subject, but we cannot refrain from giving some general figures to give the reader an idea of the size of this ornamental building erected and dedicated for the welfare of our citizens.

This New French Hospital, occupying a beautiful site 240 by 600 feet on Point Lobos avenue between 5th and 6th avenues and only a few minutes walk from Golden Gate Park is something to be proud of and every one having an interest in the health and welfare of our city will rejoice at the successful completion of such a blessing to humanity.

BOSTON'S PUBLIC LIBRARY.

THE completion of the Boston Public Library, the erection of which has caused a good deal of discussion in architectural journals, though the general opinion appears to be that notwithstanding a Boston architect was not employed as its designer, the building has much to admire.

The American Architect and Building News writing in regard to the cost of the building and expense of running the Library make the startling announcement that it would be cheaper to purchase and give outright the book required, than to lend it from the Library.

It may not be uninteresting to note the commencement of the Boston Public Library as an illustration of what can be accomplished in a community where public interest is once aroused to act for the good of the public.

At the time Mr. Bigelow was Mayor of Boston, Edward Everett, then President of Harvard University, or to write more exactly, University of Cambridge, wrote to Mr. Bigelow, as Mayor of Boston, that if the city would provide a room for the purpose he would donate a thousand volumes as a commencement for a Public Library; at the next meeting of the Aldermen, Mayor Bigelow announced that he would donate a thousand dollars for the commencement of a Public Library. Shortly after this a room was provided in the City Hall and Mr. Everett's books were sent to that place, from that small beginning the present establishment has been founded.

To Mr. George Ticknor of Boston however, perhaps the credit should be given of making the Library a popular institution, Mr. Ticknor's idea was to have a large number of duplicates purchased of any popular work that less delay might be caused in obtaining the book required for the moment.

This plan was adopted with some hesitation on the part of the trustees and from that time the Library became a Boston institution in touch with the public, therefore a success.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

STUDY for Town Hall by D. J. Patterson.

TENDERS TO BE RECEIVED.

Office of the Custodian, U. S. Quarantine Station at Angel Island, San Francisco, California, July 9, 1895. Sealed proposals will be received at this office until 12 o'clock M. on the 31st day of July, 1895, and opened immediately thereafter, for all the labor and materials required for the new bulkhead, etc., at the above named station, in accordance with the drawing and specification, copies of which may be had at this office.

Each bid must be accompanied by a certified check for a sum not less than two per cent of the amount of the proposal. The right is reserved to reject any or all bids, and to waive any defect or informality in any bid if it be deemed in the interest of the Government to do so. Proposals received after the time stated for opening will be returned to the bidders. Proposals must be enclosed in envelopes, sealed and marked, "Proposals for New Bulkhead, etc., at the U. S. Quarantine Station, Angel Island, San Francisco, California," and addressed to

DR. D. A. CARMICHAEL,
Custodian.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.
SETH BABSON, Pres. GEO. W. PERCY, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
OCTAVIUS MORGAN, Pres. A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec'y. AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

THE POSTOFFICE SITE.

THE following official report of the United States Government engineers, as to the stability of the site selected for the new Postoffice building in San Francisco, located at the corner of Seventh and Mission streets, seems to set at rest all questions as to the permanency of any building erected on this lot, and removes the last reasonable ground for longer delaying thec ommencement of work on this long needed and long hoped for building.

SAN FRANCISCO, CAL., July 8, 1895.

The Honorable Secretary of the Treasury, Washington, D. C.

SIR:—The undersigned, appointed in accordance with the provisions of the act of Congress, approved March 2, 1895, to examine the site for the Postoffice and Courthouse building in San Francisco, have the honor to render the following report:

Under date of April 5, having received notification of appointment to perform the duties assigned to us, we reported to you for instructions to guide us in the proposed examinations. On May 27th instructions were issued from the acting Secretary of the Treasury and received by us on June 4th. In this letter we were requested "to examine the nature of the subsoil and bed of the foundation, and to report to the department whether the character of the same is proper for the contemplated building, and what would be the cost of making the foundation for said building, and whether the construction of said building should be proceeded with on said site." We were further requested to make a recommendation as to the character of the foundation and present an approximate estimate of same.

Immediately after the receipt of the above mentioned letter proposals were invited from S. M. B. Haley, who made the former borings on the site, and the Beal Core Drill Company. One bid was received, that of Haley. Mr. Haley proposed to bore the site to a depth of 30 to 50 feet at the rate of $1.25 per foot; beyond 50 feet he was to receive 50 cents additional for each foot.

Under the former action of the Treasury Department four borings were made at the site. These borings will be designated A, B, C and D. Their locations approximate to the four corners of the building. A was near the southwest corner and was sunk to a depth of 149 feet. B was near the southeast corner, depth 111 feet. C was near the northwest corner, depth 147 feet. D was near the northeast corner, depth 140 feet. In a general way the borings at B, C and D show that to a depth of 38 to 40 feet clean sand of varying colors was found; thence to a depth of 50 feet clay was found and below that sand of different grades and colors. In boring A the indications were not so favorable in the upper strata, as the sand was found mixed with vegetable matter, debris, peaty sand, etc. Our boring indicates like nature of material at same location, extending through only a limited area.

We made eleven additional borings to a depth of 50 feet each. Their location is shown on the foundation plan. They are designated by numbers. Borings 1 to 6 inclusive show that to a depth of about 38 feet clean sand of varying colors was found, as in the previous borings; then a stratum of black peat about 6 inches in thickness; then about a foot of heavy black mud, and below that to 50 feet slate-colored clay. Borings 7, 8, 9 and 10 were made at the southwest corner, as at this location the nature of the sub-soil appears to indicate that some additional precautions should be taken in preparing the foundation, and the accompanying diagram shows the locations of these five borings. No. 7 was in the immediate vicinity of A. Yellow, black and white sand was found to a depth of 24 feet; thence to 40 feet sand, mud, debris, in general rather soft material, and below that to 50 feet sand and clay. No. 8 showed the general characteristics of borings 1 to 6. No. 9 showed common sand to 19 feet; then 1 foot of soft black mud and decayed vegetation; then 1½ feet of black peaty mud and sand, filled with sticks, roots, etc.; then good sand for 18½ feet, with a few grass roots at about 29 feet; at 40 feet 1 foot rotten wood and soft mud; then black clay, hard and sticky, 1 foot thick; then slate-clored and yellow sandy clay to 50.3. Nos. 10 and 11 had the usual characteristics of the first borings; that is, sand to 38 and 40 feet, and clay below to 50 feet. The results of the borings are shown on the tracings inclosed.

Throughout the site the general indications are of hill sand to depth of about 28 feet below the surface of the ground, and below that clay. The Coast Survey chart of 1858 shows that the site was a sand lot covered with brush and small trees. There was no indication of running water on the lot. It is only in the northwest corner for a distance of from 50 to 60 feet along Seventh street and along Mission that the material is of such a nature as to cause extra precautions to be taken with the foundation. Water was found at a depth of 8.8 to 12 feet. The surface of the ground was connected by levels with the beach mark (29.04) and the level of the water standing in each well was determined. This latter level is shown on the plats.

It may be stated that the material as found and brought to the surface may not show its condition in place, as the boring apparatus necessarily broke up the mass, and its mixture with the water in the well caused it to appear soft and yielding. It may be that in its natural condition it may stand the same amount of pressure as in other portions of the site.

To the first inquiry, therefore, whether the character of the subsoil is proper for the contemplated building, we are of the opinion that the building can be safely constructed upon it. As to the inquiry whether the construction of the building should be proceeded with, from an engineering point of view we see no reason to report otherwise.

It remains for us to state in a general way only the character of the foundation and to present an approximate estimate of the same. The foundation should be of concrete. The depth is given at 4½ feet. For the purpose of approximating to the cost we have taken that depth for the main walls and a depth of 3 feet for the columns, making the top, of said foundation two feet wider than the base of the wall. For a length of 60 feet on Mission street and on Seventh street, where the soft material is found, the base of the foundation is increased to 25 feet. It is assumed that the ground can be drained into the street sewer for a depth of about nine feet. The water that may be found in the sand to be extracted by pumping will probably depend upon the season in which the excavation may be done. It is hardly capable of estimate, although we insert an item for the work.

The approximate estimate of the cost of the foundation is as follows: Excavation of 9528 cubic yards of material and disposal of same at 50 cents per cubic yard, $4764; 3892 cubic yards of concrete at $7.50, $29,190; pumping, $2,000. Total, $35,944. Contingencies, 10 per cent, $3,595. Total,

$39,549. The concrete proposed consists of the best Portland cement, with twelve cubic feet of selected sand and thirty cubic feet of broken stone to the barrel.

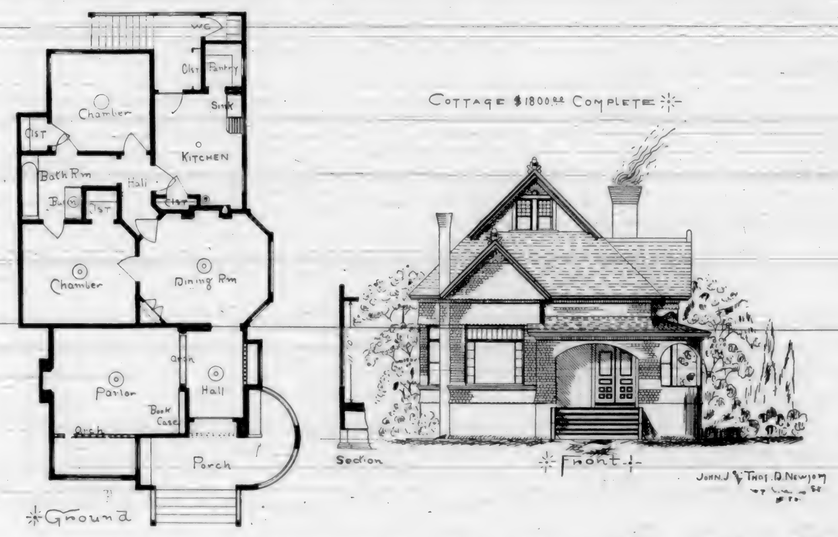
Very respectfully, your obedient servants,

G. W. MENDELL,
Colonel Corps of Engineers.
W. H. H. BENYAURD,
Lieutenant-Colonel Corps of Engineers.

EUROPEAN FORESTRY WORK.

NEARLY all the nations of Europe are engaged at the present time in so controlling the forest supply that every bit of public and private property in trees is placed under restriction against destructive cutting. The forests are all so highly protected, says the *Boston Herald*, and even where no state control exists, the freedom in cutting trees which exists in this country is unknown.

In Germany during the last twenty-five years some



300,000 acres have been reforested, and the government has granted $300,000 in this way to private owners of waste land. In Austria, since 1852, a forest law, which exercises a strict supervision over the forests, both public and private, has been in existence, and no one is allowed to devastate a forest to the detriment of adjoining holders of land, and cleared or cut forest must be replanted within five years.

In Italy the effort is constant to increase the amount of wooded lands, and the government contributes three-fifths of the cost of reforestration, upon condition that the work is done according to its plan and instruction. In Switzerland the national government contributes from 30 to 70 per cent of the establishment of new forests, and from 20 to 50 per cent for the planting of protected forests, and the law is very strict in regard to cutting.

France is also deeply interested in public forest property. The forests belong largely to communities and public institutions, as well as to the state, and they are controlled in a manner similar to the regulation of forests in Germany. Here, as well as there, no clearing is allowed except by consent of the forest administration.

In all these countries the strictest attention is paid to the subject of forestry, and schools are everywhere maintained for the purpose of instructing men in this work. Russia has been the only nation where forests have been until lately under no restriction, but since 1888 even this country has had its forest laws, and offers loans on favorable terms for the protection and increase of the forests. Hardly any European nationality is without its state control of the forests or without the training schools in which men are instructed how to take care of them.

They are trying in Europe in every way possible to save the forests, and in the United States efforts are now being made in nearly every commonwealth to regulate and control the wooded lands, but our people are not ready to accept the stringent measures which have been employed as a necessity for preservation.

Mrs. Doolan—"It's too proud yez are t' talk, Norah Foley since yez won th' bicycle in th' tin cint raffle; but if thim ain't yer ould man's pants Oi'm a nagur."—*Leslie's Weekly.*

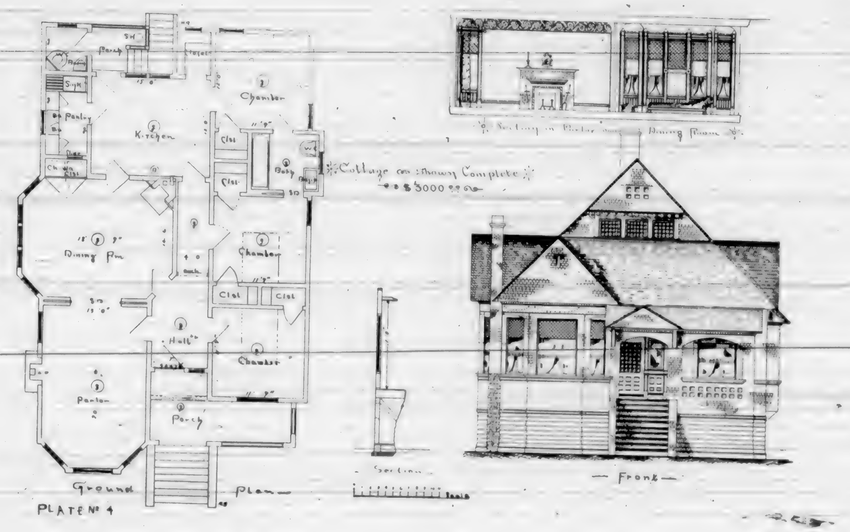
BOOKS AND PERIODICALS.

LIPPINCOTT'S Monthly Magazine for July has for the complete novel "A Social Highwayman" by Elizabeth Phipps Train. Among the contents we notice "The Whole Duty of Women" by Emily B. Stone and "The Recall of Flathers" by Charles Dudley Rhodes, U. S. A., is a sketch that will make the readers laugh.

THE ENGINEERING NEWS—We would call the attention of our readers to an able article in this magazine on "Painting Iron Railway Bridges," by Walter G. Berry of New York. In the course of his professional duties Mr. Bery was called upon to prepare a report upon this subject, and certainly he has made a very able one.

THE NEW GALAXY, published by Harry C. Jones, 92-96 Fifth Ave., New York. Subscription price one dollar a year. Volume 1, No. 1 of this magazine for June, 1895, makes a very picturical appearance while its contains much interesting reading, fully illustrated; it appears to be a tender for the *Monthly Illustrator* at $3 a year, which the same publishers announce as the finest magazine published, containing only original matter by the very best writers and the most beautiful pictures.

THE NEW SCIENCE REVIEW for July 1895, published by the Transatlantic Publishing Company, 63 5th Ave., New York, has a table of contents of unusual interest.



The following from an article on "Mental Telegraphy" by Claude Stuart Coles is certainly curious if true:

"Within us is a power, sleeping. Once in a while some sensitive soul has felt it stir, but there was no known law that governed it, no logic with which to convince others of its being; so it was buried deep in the inner consciousness, where hide ideas that dare not seek light, because they are in advance of their age.

"Long ago, at the house of a friend, I saw a photograph of a man's head. As I picked it up there came over me a sense of having known the original; it was the face of a 'friend!' When my hostess entered I asked about the photograph, and she told me who it was. The name meant nothing to me, but the face meant all things that I knew. Several times in the next week I looked at the photograph, always with the same sense of 'having known.' Then eight years elapsed, during which no memory of that face came to me. One day at the theatre, there flashed over me that same curious sense of 'having known.' Instinctively I turned and caught full the glance of the original of the photograph. What he was doing there I have never found out.

"Several miles away from me lived a friend. Days would elapse without our meeting, but if I sat down and wrote her a note she would come, always crossing the note. I became so certain about it after awhile that I would write the note and tear it up. The thought would stir in her the desire to see me. There was no use in mailing it.

"The sight of a certain handwriting would always make my heart sink; it was something that I could not reason myself out of, yet the letters were pleasant and the words fair. One dark day I found out that my instinct was right. I trust it now."

"The trouble with too many women," says the cornfed philosopher, "is that they regard the marriage ceremony mainly as a license to eat onions and wear ill-fitting clothes."—*Journal Indianapolis.*

"Grace before meat," said Noah, as he held the elephan back to make room for the antelope.—*Yale Record.*

CONTRACT *vs.* DAY LABOR.

THE question as to whether day-labor or contract is the more conomical appears to have received a very decided answer in the experiences of the Canadian Federal Government The point is being continually brought up in municipal councils, but in such cases, it is to be feared, the arguments *pro* or *con* are usually propounded by those more or less biased one way or the other, and a clear candid opinion as to the merits or demerits of either system can hardly be expected from city aldermen. The opinion of Parliamentary committees ought to be worth more, at any rate, both systems have been given fair trials in the last few years here, and the results are eminently in favor of contracts. The case of the Lachine bridges, which was re-

counted in the last Canadian letter, proved conclusively how easily the country may be defrauded, and up to almost any amount, by unscrupulous contractors. A legal precedent for the construction of the Lachine bridges was set some years ago by the plan pursued in the case of the Fort Francis locks. This costly and magnificent work was carried out by the Government, under its own inspectors, without contract, and the results were not satisfactory; but it was thought that in a city like Montreal, where labor was plentiful and wages moderate, better results must be obtained. However, as was shown in the former letter, the Government was doomed to bitter disappointment which was only aggravated by the police magistrate, Judge Desnoyers, refusing to commit the contractor for trial, although the evidence seemed clear enough as to the alleged frauds, but not, in his opinion, sufficient to warrant committal. The matter, however, is not at an end yet. Although the Government has failed in the criminal prosecution, a case for the return of overpayments is to be proceeded with. The country will hardly care to see more of its great works carried out by day-labor. The experiment of the Toronto Council in having its new municipal buildings finished by day-labor is being watched with interest. This building was begun under contract, but only reached some twenty feet above the ground level, when the contractor was dismissed. Owing to certain difficulties in obtaining satisfactory tenders for the completion of the works, it was decided to proceed with them by day-labor.

Mr. Provand, M. P. for the Blackfriars Division of Glasgow, the managing director of the Chignecto Marine Railway Company, has been in Canada interviewing the Government, and requesting for this Company an extension of time for completion of the works at Chignecto by two years. About three and a half millions have been already expended on the works, and about a million and a half more are required. The amount has been subscribed by shareholders, and it is claimed that the work could be completed in the time asked for. The Canadian Government guaranteed a subsidy of $170,000 a year, for twenty years after the completion of the works, the period of construction being limited in the Charter granted to the Company. Mr. Provand stated that it was through no fault of the Company that the work was not completed within the time specified. It was the fault of the contractor, who was largely interested in contracts in the Argentine Republic at the time of the suspension of Baring Bros., which caused his failure and the stoppage of the works. The engineer of the Company, together with Mr. Provand, visited Canada last year, with the same object in view, and interviewed the premier, the late Sir John Thompson, but, so far as is known, did not obtain any definite promise from him. Whether Mr. Provand has been successful this time or not is still uncertain, but a contention has arisen over the interpretation of the expression "efficient working" of the railway, which occurs in the agreement referring to the granting of the subsidy. The Company interprets the words to mean simply having the railway completed and ready for traffic. The other interpretation is that the road should be actually handling a reasonable amount of traffic, and it is said that if the Company desires the extension of time, it will have to show that it is carrying a minimum amount of traffic, which is put down at a million tons of shipping, annually. Mr. Provand has, in the meantime, gone home, and it is possible some time will elapse before anything is settled.—*The American Architect and Builder.*

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Liability of Contractor's Bond.—Where a building contractor abandons the work before it is completed, and absconds, the guarantor of his contract, who elects to treat the failure and flight of his principal as settled facts, and to co-operate with the owner in completing the work, becomes liable as surety.

Lender v. Kline, Supreme Court Penna., 31 Atlantic Reporter, 550.

Unguarded Excavation in Sidewalks.—The Supreme Court of California holds that a contractor who has completed an excavation in a sidewalk, as required by his contract, is not liable for injuries to persons falling into it, due to the absence of proper guards, if he did not contract to guard the excavation after it was completed.

Cotter v. Lindgren, 39 Pacific Reporter, 950.

Right of Adjoining Owner in Overhanging Wall.—The Supreme Court of New York, 1st Department, holds that where the owner of a lot erects a wall, the foundation of which is wholly on his lot, but a part of which overhangs an adjoining lot, the adjoining owner will not be enjoined from removing so much of the wall as overhangs his property.

Lyle v. Little, 33 N. Y. S. Reporter, 8.

Mechanics' Liens.—Where it appeared in an action to foreclose a lien on property owned by husband and wife, that the title was in the name of the husband only, and that knowledge of the fact that he had a wife was not brought home to the lien-holder, it was not error to render judgment for the latter, although the notice omitted the name of the wife.

Wash. Rock-Plaster Co. v. Johnson, Supreme Ct. Wash., 39 Pacific Reporter, 115.

Collection of Notes Given for Building.—Where notes were given in prepayment for the performance of a building contract, and their sale as negotiable paper was consented to by the makers at the time the contract was entered into, they cannot, in the absence of fraud, raise the issue of no consideration, in an action upon the notes by an indorsee; and they cannot contend that such party is not a bona fide holder.

Churchill v. Bielstein, Ct. Civ. App. Tex. 29 S. W. Reporter 392.

Mechanics' Lien—Bond of Owner.—A bond given by the owner of buildings upon which a notice of lien for materials and labor has been filed, conditioned for the payment of any judgment that may be rendered against the property, (as provided by the laws of New York, and some other states) takes the place of the property, and discharges and becomes the subject of the lien; and an action is maintainable upon the bond against all parties interested, including the sureties, without first foreclosing the lien upon the property.

Morton v. Tucker, Ct. App. N. Y., 40 N. E. Reporter, 3.

Penalty or Liquidated Damages.—A party advertised for bids for a court house, the notice requiring each bid to be accompanied by a check for $500, "as guaranty of good faith that the bidder, in case his bid is accepted, will enter into a contract," etc. One whose bid was accepted failed to enter into a contract within a reasonable time, whereupon the check was appropriated. The Court of Civil Appeals of Texas held that the money deposited was not liquidated damages, but a penalty, and only so much of it could be retained as would cover the actual damage.

Lindsey v. Rockwall County, 30 S. W. Reporter, 380.

Liability of Owner for Dangerous Premises.—A party was injured by the falling of a wall of a building. The owner denied negligence, and alleged that the property was in the possession of an insurance company, who were making repairs. The Supreme Court of Louisana held that, there was negligence and that whatever may have been the responsibility of the insurance company during the time that the repairs were being made to a portion of the wall, the owner, aware of the facts as to defective condition, and who takes no part to prevent an accident, is liable for the damage occasioned by the fall.

The safety of walls in a populous city is a public interest, and the interest of one injured is blended with the public right that cannot be subordinated to indefinite agreements between the insurer and insured.

Knoop v. Alter, 17 So. Reporter, 139.

BUSINESS MOSAICS.

Heating and Ventilating—Wright & Olsen at 27 New Montgomery street will furnish estimates for buildings of any size, for heating with either steam, hot water or warm air, also a combination of hot water and warm air.

This concern is agent for the Magee furnaces and ranges as well as Abram Cox Furnace Co., Barbers Ideal Heaters, and Dr. Buckley's water purifier.

Mr. Nincom—"He presented a pistol and declared he'd blow out my brains if I didn't yield." Miss Shapley—"Oh, Mr. Nincom, why didn't you yield?"—*Truth.*

A. Steiger Son's manufacturers of Architectural Terra Cotta, with every thing in their line of business. For further information apply to San Jose, Cal. or San Francisco office Builders' Exchange, 16 Post street.

Pat—"I tell you, Mike, astronomy is a great thing. Why by it you can tell when there will be an eclipse to the very hour and minute." Mike—"Oh, faith, an' that's nothin', you can look in the almanac an' see that."—*Truth.*

Concrete and Twisted Iron.—The Ransome Patents, now operated by the firm of Keatinge, Leonard & Ransome, rooms 11 and 12 Nucleus building, are showing the advantage of this style of work as is in evidence by the three large tanks for the Portland Water Works, and to come near home an example of their work at Main and Mission streets in this City may be seen, and quite at our own door as it were, the work on the Safe Deposit Building will show the advantage of this style of construction.

Customer—"So you sell these watches at $2.50 each? It must cost that to make them." Jeweler—"It does." Customer—"Then how do you make any money?" Jeweler—"Repairing them."—*Standard.*

When a man decides upon improving his shop, factory or farm, by the addition of power, he naturally looks for something entirely up to date. He investigates, considers, and finally decides to buy an Ajax Coal Oil Gas Engine as meeting his requirements more fully, and being safer, than any other power obtainable. Palmer & Rey, San Francisco, Cal., the manufacturers of this engine, have earned the gratitude of the public by placing within its reach a reliable, economical power, that defies the restrictions of insurance companies. It is the latest and best.

The J. L. Mott Iron Works, New York, Boston, Chicago and San Francisco, Mr. M. S. James, agent of the well-known firm has removed his office to room 27 Flood Building, third floor.

The new apartments are very favorably situated for the display of goods shortly to arrive from New York when a show room will be opened for the inspection of those interested in their line.

No doubt there are disinterested politicians, my son; but when you find one it will be upon the same day that you discover a shad without bones."—*Boston Transcript.*

The Union Pressed Brick and terra cotta Co., with their works at Vallejo, California, have removed their general office to 310 Pine street, room 15, San Francisco, and are prepared to fill orders in their line for architectural terra cotta, fire proofing, paving tile, etc. A catalogue will be sent on application.

Robinson—"Well, old chap, how did you sleep last night?" Smith (who had dined out)—"Like a top. As soon as my head touched the pillow, it went round and round!"—*Punch.*

F. H. Rosenbaum & Co. Anything in the way of plate and window glass can be supplied by the above mentioned firm, who are also manufacturers of mirrors, either quicksilver or patent backs. Ornamental cutting and bevelling a specialty, 567 Market street, San Francisco.

Temperance Lecturer—"Friends, how can we stop the sale of liquor?" Inebriate (in the rear of the hall)—"Give it away."—*Ex.*

Plaster of Paris. The Golden Gate Plaster Mills, 125 and 217 Main street, San Francisco. Lucas & Co., manufacturers of Calcined Plaster (Plaster of Paris,) dealers in marble dust, sand plaster and terra alba.

Jones—"Come, go fishing with me old chap." Brown—"Can't do it; just signed the pledge."—*Judge.*

Sierra Lumber Company, manufacturers and dealers in doors, windows and blinds, also on hand sugar pine, yellow pine, spruce and fir lumber. Yard, corner Fourth and Channel street, San Francisco.

CITY BUILDING NEWS.

Baker near Fell. To build; owner, Premier Cycle Co.; architects, McDougall & Son; contractor, J. M. Weir; signed, June 19; filed, June 19; cost $1794.

Brannan bet. 4th and 5th. Brick warehouse; owner, Ed. Niclaus; mason work by contract; carpenter work by day; cost $5000.

Brannan bet. 4th and 5th. To build; owners, Morgan & Cutler; cost $800.

Brannan bet. 4th and 5th. One-story frame; owner, Father Nugent; contractors, Cameron & McDonald; cost $3000. Only a temporary structure.

Bryant near 22d. To build; owner, C. W. and Anna M. Peck; contractor, Thos. Cochrane; signed, June 24; filed, June 27; cost $2670.

Bryant and Alameda. Alterations and additions owner, Market Street railway Co; architect, H. H. Lynch; contractor, J. W. Miller; signed, July 8; filed, July 9; cost $15,930.

Bryant and Alameda. Carpenter work; owner, Market Street Railway Co.; architect, H. H. Lynch; contractor, Frank Schaadt; signed, July 9; filed, July 9; cost $1150.

Bryant near 5th. Concrete foundation; owner, John Horstmann; architect, H. Geifuss; contractors, Gray Bros.; signed, July 9; filed, July 9; cost $2265.

Broadway near Kearny. To build; owners, A. Cereghino and G. Demartini; architects, Wm. Mooser & Son; contractor, H. H. Larsen; signed, July 10; filed, July 11; cost $1160.

Broadway near Kearny. Carpenter work and plumbing; owners, A. Cereghino and G. Demartini; architects, Wm. Mooser & Son; contractors, Ingerson & Gore; signed, July 10; filed, July 11; cost $1360.

Bluxome bet. 4th and 5th. To build; owner, Mr. Smith; contractors, Schutt & Krecker; cost $600.

Bush near Laguna. Sewers, plumbing, etc.; owner, Congregation Ohabai Salome; architect, M. J. Lyon; contractors, Bertram & Son; signed, June 11; filed, July 1; cost $911.

Bush near Laguna. Brick and cement work for foundation; owner, Congregation Ohabai Shalome; architect, M. J. Lyon; contractor, Wm. Stevenson; signed, June 13; filed, June 18; cost $1600.

California near Mason. Excavations, concrete, etc.; owner, Elizabeth J. Frieot; architect, E. Depierre; contractors, Gray Bros; signed, June 29; filed, July 3; cost $1708.

Castro and 19th. To build; owner, M. Sanders; architect, H. Geifuss; contractors, Lorenzen & Feyrier; signed, July 3; filed, July 3; cost $1490.

Caselli near Douglass. To build; owner, Mrs. Annie Lacy; architects, Shea & Shea; contractor, Arthur Stevens; signed, July 3; filed, July 10; cost $2695.

Church near 27th. Additional story; owner, John Foge; architects, Havens & Topke; contractor, D. Ross; signed, June 29; filed, July 2; cost $1645.

Ogle and Waller. Five two-story frame dwellings; owners and builders; Cranston & Keenan; cost $20,000.

Ogle and Waller. To build; owners and builders, Cranston & Keenan; cost $3500.

Clayton near Waller. Three two-story frame dwellings; owner and builder, Wm. Hinkel; cost $12,000.

Clement and 33d Ave. Car house; owner, Sutro Railroad Co.; architect, V. Krolow; contractor, T. McLachlan; signed, June 16; filed, June 27; cost $7250.

Fourth near Howard. Carpenter work for four-story brick; owner, Hugh Dimond; architect, C. J. I. Devlin; contractor, J. W. Smith; signed, June 26; filed, July 8; cost $6696.

Fourth near Howard. Plastering; owner, Hugh Dimond; architect, C. J. I. Devlin; contractor, Martin Garrick; cost $1100.

Fourth near Howard. Brick, granite, etc.; owner, Hugh Dimond; architect, C. J. I. Devlin; contractor, P. E. Fitzsimmons; cost $5895.

Fourth near Howard. Plumbing; owner, Hugh Dimond; architect, C. J. I. Devlin; contractor, Jas. E. Britt; cost $1987.

Fourth near Howard. Iron work; owner, Hugh Dimon; architect, C. J. I. Devlin; contractor, H. Ralston; cost $5600.

Fourth near Brannan. To build barn; owner, Mrs. Zoe J. Venard; architect, C. M. Rousseau; contractor, R. J. Pavert; cost $1240.

Fourth near Howard. Galvanized iron work for four-story brick; owner, Hugh Dimond; architect, C. J. I. Devlin; contractor, Jas. Guilfoy; cost $1000.

Fourth near Brannan. To build; owners, Krug & Yung; architect, F. Mead; contractor, W. H. Mead; cost $1000.

Fourth and Brannan. To build barn and stable; owner, H. B. Goeckens; days' work; cost $1000.

Filbert near Mason. To build; owner, Mrs. Mary Bogan; architect, C. M. Rousseau; contractor, C. Knuttc; signed, July 10; filed, July 11, cost $4200.

Filbert and Jasper. To build and alterations; owner, Trinidad Boyling; architect, P. Boulin; contractor, L. M. Weismann; signed, June 25; filed, June 27; cost $2420.

Fillmore near Waller. Alterations and additions; owner, Geo. Scott; architect, A. J. Barnett; contractor, M. Hartnell; signed, June 22; filed, July 2; cost $1725.

Fifth near Bryant. To build; owner, C. Reichling; days' work; cost about $2000

Francis near Mission. Cottage; owner, J. B. Mathews; contractor, W. W. Redmall; signed, July 9; filed, July 9; cost $695.

Fulton near Broderick. To build; owner, Patrick Lally; architect, H. Geilfuss; contractor, W. A. Muller; signed, June 17; filed, June 17; cost $3035.

Gough near Vallejo. To build; owner, Edward B. Rambo; contractor, W. H. Wharff; signed, June 20; filed, June 21; cost $5550.

Green near Scott. To build; owner, Robert K. Palach ; architect, Edgar A. Matthews; contractor, Andrew T. Ruch; signed, June 6; filed, July 2; cost $1723.

Greenwich near Jones. Two three-story buildings; owner, C. Bill and J. Ohlemutz; architect, Emil John; contractor, J. McLean; signed, Jun filed, June 28; cost $7725.

Guerrero near 15th. Two two-story frames; owner, W. J. B. Henriyulle; architect, T. Godart; contractor, J. A. Arnott; signed, June 20; filed, June 22; cost $6985.

Harrison near 25th. Alterations and additions; owner, Mrs. Margaret Godial; contractors, Westerlund & Holmgren; signed, May 18; filed, June 24; cost $1400.

Hayes near Webster. To build; owner, Mrs. Mary Marsily; architect, C. M. Rousseau; contractor, R. J. Pavert; signed, June 22; filed, June 25; cost $8875.

Haight near Scott. To build; owner, Mrs. F. Cahill; architects, Mahoney & Ryland; contractors, Ackerson & Paterson; signed, June 25; filed, June 29; cost $4923.

Haight and Fillmore. Alterations and additions; owner, Chas. Haigmaier; contractor, G. H. Gillespie; signed, June 6; filed, June 18; cost $4500.

Helen near California. Alterations and additions; owner, John J. Mundwyler; contractor, H. R. Schmuckert; signed, June 27; filed, June 27; cost $2645.

Holy Cross Catholic Cemetery. Vault lined with marble; owners, Executors Estate of J. Ivancovich; architect, B. J. Clinch; contractor, A. Paltenghi; signed, June 21; filed, June 24; cost $1425.

Jackson near Stelner. To build; owner, Austin C. Tubbs; architects, Mathesen & Howard; signed, June 12; filed, June 21; cost $3340.

Jessie near 14th. To build; owner, Mrs. C. L. Straven; contractor, A. Petry; signed, July 8; filed, July 8; cost $1690.

Laurel Hill Cemetery. Granite coping and concrete foundation; owner, Sharon Estate Co.; architect, A. Page Brown; contractor, P. Deegan; signed, June 28; filed, July 1; cost $1498.

Lombard near Fillmore. Three two-story buildings; owner, Michael Hogan; contractor, C. Andresen; signed, June 4; filed, June 19; cost $6250.

Market near 5th. Sewers, plumbing, etc.; owner, Mrs. Abbey M. Parrott; architects, Pissis & Moore; contractor, R. A. Vance; signed, June 19; filed, June 24; cost $38,775.

Market bet. 5th and 6th. Mosaic floor, etc.; owner, Miss Emma Spreckles architects, Reid Bros.; contractors, W. W. Montague & Co.; signed, May 28; filed, July 2; cost $8000.

Market bet. 5th and 6th. Marble work; owner, Miss Emma Spreckles; architect, Reid Bros.; contractor, W. S. Brown & Co.; signed, June 14; filed, July 2; cost $2116.

Market and Sanchez. To build; owner, Mrs. E. L. O'Neil; architects, Salsburn & Embury; contractors, West & Fenn; signed, July 6; filed, July 6; cost $4235.

McAllister and Fillmore. To build; owner, Caroline B. Watson; architects, Percy & Hamilton; contractor, Winslow Hall; signed, June 26; filed, June 26; cost $10,943.

McAllister and Fillmore. Plumbing; owner, Caroline B. Watson; architects, Percy & Hamilton; contractor, R. Rice; signed, June 26; filed, June 26; cost $1500.

McAllister and Pierce. To build; owner, Mrs. B. Morris; architect, J. E. Krafft; contractors, Ackerson & Paterson; signed, June 19; filed, July 8; cost $6170.

Mission and New Montgomery. Carpenter work on two-story brick; owner, Builders' Exchange; architect, A. Page Brown; contractor, D. Powers; signed, July 8; filed, July 11; cost $2070.

Mission and New Montgomery. Mason work, Spanish tiles, etc.; owner, Builders' Exchange; architect, A. Page Brown; contractors, Riley & Loane; signed, July 8; filed, July 11; cost $2397.

Mississippi near 18th. To build; owner, J. Greig; contractors, Westerland & Holmgren; signed, July 3; filed, July 3; cost $2464.

Oak and Clayton. To build; owner, Ellen B. Franzell; architects, Coxhead & Coxhead; contractor, Wm. Knowles; signed, July 12; filed, July 12; cost $7261.

O'Farrell near Powell. Additions and alterations; owner, Mrs. S. O. Alexander; architects, Salfield & Kohlberg; contractor, H. Rohling; signed, May 24; filed, June 25; cost $3025.

Pacific near Leavenworth. Alterations and additions; owner, Margaret Wolfarth; contractor, H. R. Schmuckert; signed, June 18; filed, July 9; cost $1845.

Pacific near Leavenworth. To build; owner, B. Frank; architect, H. Geilfuss; contractor, John H. Munster; signed, June 18; filed, June 20; cost $3124.

Pennsylvania Ave. and Butte. Alterations and additions; owner, James Eva; architect, R. H. White; contractor, W. Chatham; signed, June 19; filed, June 19; cost $1993.

Pierce and Fulton. To build; owner, Wm. McCormick; architect, A. J. Barnett; contractors, Ogle & Smith; signed, June 28; filed, July 1; cost $9700.

Pine near Buchanan. To build, owner, J. A. Ulrich; architect, E. J. Vogel; contractor, M. J. Savage; signed, June 20; filed, June 24; cost $4C30.

Pine near Taylor. Carpenter work; owner, Edward B. Hinds; contractor, M. J. Savage; signed, June 17; filed, June 20; cost $6500.

Pine near Taylor. Plumbing, etc.; owner, Edward B. Hindes; contractor, Philip Haub; signed, June 17; filed, June 20; cost $1195.

Pt. Lobos Ave. near 33d. Cottage and stable; owner, Eliza Potter; contractor, W. W. Redmall; signed, June 18; filed, June 20; cost $2000.

Richland Ave. near Anderson Ave. To build; owners, E. F. and Nellie Sautter; architect, J. V. Embury; contractors, Salsbury & Embury; signed, June 12; filed, June 20; cost $1700.

Sacramento near Baker. To build; owner, J. H. Loeber; architects, Townsend & Wyneken; contractor, D. Currie; signed, June 25; filed, June 27; cost $2350.

Sacramento near Devisadero. To build; owner, Esther M. Wilson; architect, W. H. Lillie; contractor, W. J. Field; signed, June 27; filed, June 28; cost $4825.

Sacramento near Laguna. To build; owner, Richard E. Queen; architect, A. Page Brown; contractors, Mahoney Bros.; signed, June 18; filed, June 18; cost $27,085.

Sagamore near Capital. Two Cottages; owner, William Forbes; contractor, John Flaherty; signed, June 21; filed, June 22; cost $1250.

Sixth Ave. near Clement. To build; owner, John Higgins; contractor, M. J Scott; signed, July 3; filed, July 3; cost $1170.

Sixth and Stevenson. Steam heating in four-story brick; owner, Margarethe Schwerdt; architects, Laist & Schwardt; contractors, J. G. Grannis & Co.; signed, July 1; filed, July 11; cost $1246.

Stockton and California. Additions and alterations; owner, Alfred E. Davis; superintendent, J. W. Duncan; carpenters, Cannon & Mooney; cost $10,000.

Second Ave. near California. To build; owner and builder, Mr. Haskell; cost $2000.

Second Ave. near California. Cottage; owner, G. H. Earle; architect, J. C. Pelton, Jr.; contractor, Jas. McConahey, signed, June 20; filed, June 29; cost $1700.

Second Ave. near Clement. Cottage; owner, Isador I Green; contractor, W. W. Redmall; signed, June 18; filed, June 18; cost $2000.

Scott near Fulton. To build; owner, Mrs. Eliza Baum; architects, Kenitzer & Barth; contractors, Schutt & Krecker; signed, June 25; filed, June 26; cost $6414.

Tennessee near 19th. To build; owner, Rev. P. O'Connell; architects, Mahoney & Ryland; contractors, R. Doyle & Son; signed, June 16; filed, July 1; cost $9089.

Third Ave. near Clement. To build; owner, R. I. Whelan; contractor, H. Rowe; cost $2100.

Twelfth Ave. near California. To build; owners, Jules J. Bailly and wife; contractor, Wm. R. Kenny; signed, June 28; filed, June 29; cost $1225.

Twenty-second and Guerrero. To build; owner, A. Marcacci; architect, E. J. Vogel; contractors, Patterson & Person; signed, June 29; filed, July 2; cost $8872.

Van Ness Ave. and Clay. Steel work; owner, Claus Spreckles; architects, Reid Bros.; contractors, Western Iron Works; signed, June 12; filed, July 2; cost about $8000.

Washington near Mason. Alterations and additions; owner, J. Mueller; architects, Mooser & Son; contractors, Patterson & Person; signed, June 28; filed, June 29; cost $2800.

Washington near Central Ave. To build; owner, Constant Richert; architect, E. Depierre; contractor, Davie Ross; signed, June 21; filed, June 26; cost $3420.

Washington near Fillmore. To build; owner, Emma Joseph; architect, W. H. Lillie; contractors, Moore & Cameron; signed, June 26; filed, June 26; cost $2547.

Waller near Masonic Ave. Four two-story frames; owner and builder, J. Stierlein; cost $16,000.

Waller near Masonic Ave. To build; owner, Mrs. Martin; builder, J. Stierlein; cost $4000.

York near 22d. Cottage; owners, Ella and Peter Kammerow; contractors, Ogle & Smith; signed, July 6; filed, July 6; cost $1700.

York near 22d. Cottage; owner, Robert Goetze; architect, Emil John; contractor, F. A. Hellmuth; signed, July 10; filed, July 12; cost $1625.

NOW IN THE SIXTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

A GOOD deal of friction and bitterness will probably be caused between the various parties whose interests are concerned, by the action of the Builders' Exchange in voting that their members shall not bid for the erection of any building where any of the work is segregated. The large contractors hold that to protect themselves it is necessary that they have full control of the building during its construction, and argue that the work can be advanced more rapidly, and done more satisfactorily, than when each branch of the work is made a separate contract, and performed by mechanics who pay no regard to other interests than their own.

This is certainly true on small buildings, and saves time to the owner, and annoyance to the architect; but when it comes to construct a modern building costing tens or hundreds of thousands of dollars, there are arguments to be advanced in favor of subdividing the work. The owner may have preferences as to who shall perform certain branches of the work and is desirous of chosing such parties as he has reason to believe will give the best satisfaction and do the best work, whereas the main incentive of the principal contractor will naturally be to secure the performance of the work at the lowest possible figure. The contractors for the sub-branches feel more security in dealing directly with the owner, knowing that they run no risk of having to accept a *pro rata*, that bugbear of the sub-contractor.

The questions involved will, from all appearances, be brought to a test in erection of the latest improvements projected by one of our largest capitalists, and as all parties are ready for the fray, interesting developments may be confidently expected, for both sides seem to be confident of the correctness of their positions, and firm in their intentions to maintain them.

WE learn from a telegraphic dispatch published in *The Call*, that the Supervising Architect of the Treasury Department is to visit this city for the purpose of inspecting the site of our long proposed, New Postoffice Building, which of late years seems to have assumed the proportions and characteristics of other Castles in Spain. It is sincerely to be hoped that Mr. Aiken will find the site material and substantial enough to warrant him in beginning the preparations of plans for the building, but nothing short of *seeing* building operations commenced will ever make the public of San Francisco believe there is any remote future possibility of having a more suitable postoffice building than the tumble-down, rattle-trap of a shanty that has done service for so many decades.

THE MECHANICS' INSTITUTE EXHIBITION.

AFTER a lapse of two seasons the Mechanics' Institute is again being held—with some improvements on the old ones in the way of decoration and arrangement. The ground and gallery plans are arranged in an open and systematic way which conduces to a rapid and exhaustive survey of the whole exhibits by those who come for that purpose and at the same time affords a good *coup deil* from all parts of the building for those who come simply to lounge. The exhibit of the Arts relating to Building and Architecture is not as complete as it ought to be and it strikes us that a grouping together of all these Arts in one part of the building and arranged in classes; so that an easy comparison may be made between different materials, patents, etc., of the same description, would be a desideratum; this could evolve into a permanent museum of the Building Arts placed in one corner of the spacious pavilion, always open to the public.

Glancing over the exhibits already installed, we find in the way of building material commencing at the foundations the following:—

A fine exhibit of different sized crushed rock suitable for concrete and other purposes—as well as a part of a wall built of stone from a quarry in San Francisco which makes a fine hard blue building stone and of which the new Golden Gate Park Lodge is being built by Gray Bros., and is especially suitable for Rubble work. Marble is represented by Inyo Marble Company, who present a collection of their beautifully marked marble—good both for building and decoration purposes—while the capacities of terra cotta are exemplified by an East Oakland Terra Cotta works. Marble, granite and other stones as applied to monumental purposes are exhibited by Jones Bros.

In the Hallidee Ropeway—of which there is a large and a small sized model—we have an economical means of transporting building material from their resting place in the earth to place of manufacture, and it allows of development of quarries, mines, etc., in places which otherwise would have to remain undeveloped for years. It seems to us that this might be used to advantage on buildings covering a large area in course of construction for the transportation of brick, mortar and other material from one scene of operation to others.

In the way of miscellaneous articles relating to buildings we notice saws for wood-working machinery by Pacific Saw Manufacturing Company. Building paper, including a model showing roofing paper applied to a gravel roof, and deadening felt by the Paraffine Paint Co., Asbestos by Joshua Hendy Co., and a paint and its application by the Ferre Elastic Paint Co.

In the matter of heating and ventilating, Wm. Cronan has a very creditable exhibit as well as a model of a patent Ventilated Iron Skylight—all of which is deserving of attention.

In furniture and decoration, there are some very good exhibits, those of Plum and of Fredericks standing out as attractive. Some artistic metal hanging lamps in Oriental style are exhibited by G. Benyard. We miss the always attractive exhibit of Stained Glass by Mr. John Mallon, which had become quite a feature of former fairs but are compensated for it by the extensive and good exhibit of Butterworth & Company.

In plumbing—the Furlong Cement Wash Trays offer a cleanly and durable article. Finally the Patent Swing Window turns up as usual, in what seems to be the most feasible shape yet for locking the sash and for swinging it inwards for washing purposes, including an ingenious method of fixing the inside stop of the frame. This is exhibited by the Surety Window Hinge Co., E. S. Barney, manager.

Coming to the Fine Arts we find Architecture unrepresented—sculpture in a very slight degree and painting in many cases very well. This is not as it should be and we hope before the next exhibition that an effort be made to have the Noble Art of Architecture thoroughly well and systematically represented—an Art in which the public requires to be educated more than in any other for the reason that it is one in which the choice of an architect by a client is made in ignorance more often than in other professions, the people trust to themselves and do without professional advice and in consequence the educated eye has to endure many offences against it. For which reason an exhibit of only the good in architectmre should be made in such a popular resort as the Mechanics' Fair. We hope that the Architects and the Chapters may get together and get a good collection of their works at the next exhibition—and that the directors appoint a competent hanging committee.

The other Fine Arts, those of Feeding and Draping the human body, are very well represented and it is a good sign that such important arts are not neglected, for without proper food and clothing we cannot expect to have noble architecture, sculpture or painting.

A VISIT FROM THE SUPERVISING ARCHITECT OF THE TREASURY DEPARTMENT.

WASHINGTON, D. C., Aug. 15.—Now it is the supervising architect's turn to take a junket. A representative of *The Call* had an interview with him to-day concerning the construction of the new postoffice building at San Francisco.

Mr. Aiken is a secretive official, and is careful to give out as little information as possible regarding public works. He keeps himself carefully behind closed doors, and outside of his sanctum stands a guard who has been given strict orders to rigidly exlude newspaper men.

The Supervising Architect is naturally a little bit disgruntled, because of many severe newspaper criticisms of the conduct of his office. He is also nettled because many influential newspapers advocate a change whereby the plans for Government buildings will be awarded to outside architects, after competitive examination. It is believed that this plan will secure the best talent in the country, and Government buildings of the future may be of architectural beauty, instead of the grand, gloomy and peculiar edifices now in vogue.

Mr. Aiken is quite an independent individual, and takes care that this fact shall become known. When he was seen to-day, *The Call* representative said to him: "The San Francisco people are anxious to know when their postoffice building is going to be commenced. They have been trying for so many years and have met with so many disappointments that they are beginning to feel that it is almost a forlorn hope. But now that the Board of Engineers has reported that the Seventh and Mission streets lot is firm enough to support the structure, they would like to know what is the occasion for further delay."

The architect said: "Yes, I know all about that, I know the whole history of the matter, but we cannot perform impossibilities. There are 125 new buildings to look after, and 480 that have to be patched up continually. We will begin work on the San Francisco postoffice just at soon as possible. Next week I am going to start for San Francisco to make a personal inspection of the premises. Director of Mint Preston will accompany me, and we will stop off at Denver to examine different sites offered for the new mint to be erected there. We will then stop a day or so at Salt Lake, where is to be a new building erected. I will also visit Portland, Or., and may stop on my return at Boise. The two Idaho Senators are involved in a dispute as to the selection of a lot for the new postoffice there, and I may decide that matter myself."

Replying to a question Mr. Aiken said he thought the Seventh and Mission streets lot at San Francisco was all right, but would not state the exact nature of the business that required his presence there. The architect was asked whether or not, in his opinion, the work of construction would be commenced this fall or winter.

"The angel Gabriel can answer that question better than I," he said, "I expect to be back in Washington within thirty-five days from the time I start, and immediately upon my return I expect to begin drawing plans. You must understand that thus far only sketch plans have been prepared, and these have been published. I don't know how long it will take to finish the plans or how long it will be before the work of excavation will be begun."

The Call correspondent suggested there was fear expressed in some quarters that Secretary Carlisle was really responsible for the delay in the construction of the building, as well as other Government works, as he wanted to keep every dollar possible in the treasury in view of the state of finances.

"Yes, I know," replied the architect scornfully; "the people are not discriminating enough to lay the blame where it properly belongs—on Congress."

It was then suggested that California people were inclined to believe that there State was a little too far from the seat of Government; in other words, that they were not "in it," geographically speaking.

"I cannot help what they think," said he. "We will not favor any city because of its proximity, or neglect it by reason of its remoteness. You can wire that to your people."—*The Call.*

WHAT makes life dreary is want of motive.—*George Eliot.*

REASONABLE SKILL AND CARE.

THE phrase "reasonable skill and care" is so often used in a legal sense, and so much turns upon its meaning in the discharge of the architect's functions, that it may be worth while asking what it implies in the ordinary duties of the practitioner. When an employer claims damages from his architect for negligence or want of skill, he has to prove by attested witnesses the truth of his allegation, and of course, this is a question of expert evidence. It is not an arbitrary or fixed measure of skill, but sufficient under the circumstances of each case, which varies, as a matter of course. For example, in the design of a hospital, it would be reasonable to suppose that the architect planned his sick-wards on principles that were generally recognized; that the sanitary provisions were sufficient and convenient, that the heating and ventilation were devised upon good models. If he failed in any of these points of plan or provision, he could not be said to have shown reasonable skill. Mr. Brown is a good general house designer, but has had no experience in the planning of a free library. Would it be just to charge him with having failed to carry out the requirements of the committee? Here the question of limited experience might be urged; that the promoters knew beforehand Brown had no experience in building libraries, says *Building News*, and that they could not therefore expect him to exercise a high degree of skill in the design or plan. Such a view of the matter has been held by judges and juries, they holding that "reasonable skill" must be interpreted in a limited sense in such a case. But there is a presumption that every professional man represents himself as possessed of the requisite ability and skill. When an architect is employed to carry out any building, no matter of what description, and he undertakes the work, there is an implied warranty on his part that he is reasonably competent to the task. And this is the general and reasonable view. Mr. Tompkins, the architect, who undertakes to design Mr. Smith a house or a shop, is supposed to bring to his task all necessary knowledge and experience, and on his part Mr. Smith expects all that he has bargained for, and certainly holds Tompkins responsible for any defects in design or negligence in superintending the building. If it were not so, an employer might just as well engage a builder or a foreman of works to carry out what he wants in his own way. In the same manner, a man who was suffering from illness or some malady might save the cost of a doctor's fee by going to an apothecary, and would be himself to blame if by mischance a wrong medicine was given to him. On the other hand, if he went to any registered medical practitioner—whether or not he was a specialist matters little—he would be justified in assuming that his case would be treated with a certain or reasonable amount of skill, or that at least, his competence for the task would be assured him. If it was an eye or throat trouble, the general practitioner would, at least, prescribe safe measures that were generally followed; or, if it was too complex a case, would at once recommend his patient to go to an hospital or consult a specialist. And so the professional architect is presumed to understand the requirements of any particular building he undertakes—so far, indeed, as to protect his client against loss or damage.

One of the frequent charges brought against the architect is that of under-estimating. A client has a right to expect a certain degree of accuracy in the estimate he receives, and

if he prescribes an outside limit of expenditure, he has reason to be dissatisfied if the lowest tender exceeds that limit to any large extent. A reasonable approximation to the actual cost is certainly a question of skill. When the contract sum exceeds, say, by thirty per cent the architect's estimate, it can hardly be said that reasonable skill or care has been exercised, unless of course, as ofter happens, additions, changes, or alterations have been made during its progress. Estimating is certainly one of those branches of architectural practice about which a certain degree of skill is looked for. The Law Court reports afford ample evidence of what is expected from the architect. No doubt the profession are great sinners in this respect. The exceeded estimate is a common reproach leveled against architects, but that is no reason why they should be content to bear the brunt of a charge which is damaging to their interests, and which in many instances can be avoided. An architect is blamed for many things which are not to be placed to his charge. For instance, he cannot forsee the nature of the soil on which his building is reared. When the digging for foundations is begun, it often turns out that they must be sunk to a greater depth than show or specified, and expense of concrete or even piling may be incurred. The architect is blamed because he has not forseen this, and provided for it. His estimate has been based on a superficial examination, or on borings that have been supplied him; these turn out misleading, and his charges are disputed because he neglected to make a more thorough personal examination. In one or two cases cited the architect has failed to recover on this ground. But such charge can scarcely be said to be due to want of skill; it is merely an excusable omission on his part, which may be made up at any time without incurring loss.

Then we have supervision. What is a reasonable amount of supervision will always be a very debatable question, because some people are apt to think that every part of the building should be inspected and approved by the architect; while his nation of his duties is that he gives only a general supervision, and is not responsible for such things as improper bricks in any conceivable situation, or the stone to be laid on its natural bed in every part, nor is he responsible for the laying of drains underground or their proper jointing. The charge of want of skill or negligence may be raised by an irate client in several ways. There may be mistakes in the design in the use of materials, and it is for every architect, in the particular circumstances in which he is placed, to avoid these as far as he can. Want of skill in design is again a question depending on the evidence of experts, which may vary. Conceptions of plan, for example, would be difficult to define in many cases unless there was some glaring omission, or some self-evident want of skill—as, for instance, a hall with inadequate means of ingress and egress, a too-narrow main entrance, cramped or dangerous staircase, a dark corridor. Want of skill would arise if an architect planned a block of offices with windows too small for giving adequate light, or without considering the right of the dominant adjoining owner to obstruct. A ccurt of law will assume, naturally, that it is the duty of an architect to make himself familiar with the law of easements, such as those of light and air and support, as his ignorance of the law may involve his client is serious litigation and loss. Examples of such cases abound in our columns of "Legal Intelligence." Every arcnitect is presumed to know so much law as will be necessary to pertect his client's interests. There is no excuse for a professional man in London or elsewhere if he blunders in not complying with the Building Act or by-laws, and thereby puts his client to needless expense. The law will not excuse him by pleading ignorance of its provisions.

So also with respect to other matters than those directly connected with his profession. There is no excuse for him to plead ignorance of engineering. He cannot plead that he knew nothing of treacherous soils or the substrata of the site if theifoundations give way and the building settles, or thet it was a technical matter outside the architect's work. If he did not know how to provide for wet sand or clay, or what engineering expedients to adopt, such a piling, or planking, or coffer dams he should has called to his assistance someone who did. Again, if through defective design an iron girder gives way, precipitating a wall, or an iron roof collapses, causing serious injury, it will not do for the architect to exonerate himself and lay the blame on the engineer. If an arch fell in from want of sufficient abutment, as shown by scale on the drawings, the architect would certainly be held liable, and the same if any wall or column proved too weak. Perhaps in questions like ventilation and acoustics there would be more difficulty in proving incompetency. We are not aware that any legal charge of incompetence has been made out against any architect because the ventilation of his building was bad, or because the acoustical properties of a concert or lecture hall were defective. These are matters about which there are conflicting views and theories. It may indeed be affirmed generally that the term "reasonable skill and care" could only be applied to those practical and definite matters relating to building which every architect is supposed to know, and not to questions of any speculative or doubtful kinds, about which opinion would naturally vary. A wide interpretation of the meaning of the phrase would be given by any jury in some cases where, for instance the complexiiy of the building or its conditions rendered the architect not altogether responsible, and the phrase would bear a more definite meaning in connection with buildings of ordinary size and every-day use.—*Building News.*

INCREASE OF BUILDING IN THE NEAR FUTURE.

EVERYTHING points to a great increase in building operations in the near future, all over the country. In New York, which, as the centre of business, feels very promptly improved general conditions, the amount of building is already enormous. The number of permits for the erection of new buildings during the past six months, says *The American Architect and Building News*, is almost exactly twice as great as the number issued during the corresponding part of 1894, and the proportion between the intended cost of the buildings for the two periods follows nearly the same ratio. Meanwhile, the number of permits for alterations has not very much increased; showing that the hesitating season of alterations, which usually precedes a time of confident and extensive building, is nearly over, and that New York, at least, is entering on a new era of development. How soon its example will be followed by other cities remains to be seen; but nothing is more certain than that the prosperity of one part of the country means the prosperity of all; and local conditions can only in a slight degree delay or modify the change which building interests have for the last few years looked and hoped for.

THE BLAST AT PENRHYN SLATE QUARRIES.

A SPECIAL correspondent of the London *Times* writes:—Until the afternoon of Saturday, April 27, Y Talcen Mawr was the central point and perhaps the most striking feature of those famous quarries near Bethesda which have been in operation since the reign of Queen Elizabeth, and have changed half the rugged protuberance of the mountain called Bronllwyd into a deep amphitheater. Many thousands of people who have visited the quarries must carry with them a memory of the Talcen. It was a rough slab-sided obelisk of grey rock, with a bold vein of white quartz at the summit. Its height from the bottom of the quarry was about 300 feet, and it was pierced at regular intervals with tunnels representing the level of operations at various periods in the past history of the quarry. At all times this great pillow of green rock presented a picturesque appearance, whether it was viewed from above or below, for the terraces, which the quarrymen call galleries, of purple slate, rising tier upon tier, one upon another, almost to the top of the mountain, formed a singularly effective background. Opinions vary as to the reason why this upstanding fragment of a dyke which ran across the center of the quarry from north to south was suffered to remain, while the dyke itself was cut away on either side; but the better opinion is that a manager of the quarry who flourished at the beginning of the century, not forseeing the colossal scale upon which the quarry would be worked in the future, hoped that this portion of the green rock might serve as a support for one side of the quarry. But the quarry grew beyond his expectations. The quarrymen cut through the dyke on either side, and left the Talcen in obelisk, which grew more and more picturesque and more and more dangerous every day and every year as the slate rock was cut away deeper and deeper at its base.

It was in August of 1894 that, after a report from the chief agent had caused Lord Penrhyn to make a personal inspection, the Talcen was doomed, and the wisdom of the sentence was proven almost at once by the sudden fall, fortunately in the night of a fragment weighing several tons, which if it had fallen in the day, must have destroyed a large number of quarrymen. From that date till Saturday preparations for the great blast proceeded, and on Saturday the huge pillar, weighing 125,000 tons at the least, was demolished. The spectacle was imposing in the extreme. On the very brow of the quarry, fully 500 yards away from the scene of the coming explosing, and some hundreds of feet above it, a knot of privileged spectators was assembled near a flagstaff. The time was a few minutes past three. All along the brow of the quarry, and up on the slopes of the mountain above were crowds of spectators. All knew that in the bowels of the Talcen were two charges of powder, one of three tons and the other of four tons. At last the decisive moment came. The flag on the brow of the quarry was hoisted. A blue wisp of smoke from the base of the pillar, and all present knew that the triplicate fuses has been lighted, and that the hugh bricked-up chambers of powder would do its work shortly. There was a silence of expectation for five minutes or so, an interval which was almost painful; but still the wisp of blue smoke rose lazily, and a little cascade of water on the Bethesda side of the rock fell down merrily. The minutes passed very slowly, but at last—sixteen minutes and a half after the flag had been hoisted—there was a crashing sound. The noise was not so loud as one would have expected. With it came an outburst from the base of the pillar of smoke, of minute dust and of something that was either flame or red-hot powder of stone. Away from the top of the pillar sped two kestrel hawks which have nestled there for many a year. The base of the great rock seemed to fall away as water falls from a fountain jet at its highest point. There was no sign of any stone being thrown to a great distance. Then, in less time than these words occupy in the writing, but in orderly sequence none the less, there was the roar of huge masses of stone rolling one upon another, and with it came the spectacle of the huge rock sinking and subsiding with a slowness that was almost majestic until it was a mere chaotic mass of boulders reeking with smoke, quivering and gliding downwards for many minutes like an avalanche. Another minute followed, and then the whole of the quarry was vested in a cloud of heavy and evil-smelling smoke, of which however, the keen wind made short work.

MR. RICHARD MORRIS HUNT.

THE profession of architecture, not only in this country, but throughout the world, has suffered a great loss in the death of Mr Richard Morris Hunt, which occurred at his country house at Newport on Wednesday. Mr. Hunt was born at Brattleboro, Vermont, October 31, 1828, of a distinguished family. The sons of this generation seem to have been endowed with artistic talent in a remarkable degree, for a brother, the late William M. Hunt, became one of the most noted painters that this country has ever produced. Richard, while yet a very young man, was sent to Europe to complete his education, and, while there, was taken with a fancy for architecture. With characteristic energy, he prepared himself for entrance into the School of Fine Arts in Paris, remaining there for about seven years, under the great Lefuel; On leaving the School, he travelled extensively, and, returning to Paris, was invited by Lefuel, who was then engaged in building the wings connecting the Tuileries and the Louvre, for the Emperor Napoleon III, to become his assistant. He accepted the invitation, and is reputed, according to the tradition among New York architects, to have designed many of the details of the building, including the entrance archway from the Rue de Rivoli to the court-yard. At this time, Hunt was much more a Frenchman than an American. At the time that he entered the School of Fine Arts, he was, we think, the only American in the School, or, at least, in the Department of Architecture, and he was identified with French architectural design, and French architectural practice, until his work on the Louvre was finished. Returning then to America, he was employed for a time by Dr. Walter on the extension of the Capitol at Washington, and then entered into practice on his own account in New York. Although comparatively rich, both by inheritance and by marriage, he worked assiduously and ardently in his profession, and designed and carried out an immense number of fine buildings. In New York, those which occur to us at the moment are the Lenox Library, on Fifth Ave., the *Tribune* Building, on Printing-house Square, the W. K. Vanderbilt house, on Fifth Ave., the Osborne house, on Park Ave., a hospital near Third Ave., the Marquand house, and many other dwelling-houses, besides several mercantile buildings on Broadway and elsewhere; and the pedestal to Bartholdi's Statue of Liberty; besides the Vanderbilt Mausoleum, on Staten Island, and a large number of monuments. In Newport,

he built many splendid country houses, including the so-called Marble Palace, belonging to Mrs. W. K. Vanderbilt, and the magnificent Goelet house, reputed to have cost a million dollars. In Boston, his work is represented by the two Brimmer houses on Beacon street. At Asheville, North Carolina, he was engaged, at the time of his death, in the completion of an immense house for another of the Vanderbilt family. In the assignment of the work for the Chicago Exposition, he was given the principal place, by being asked to design the Administration Building, and all the world knows how he succeeded. Before that time, however, his great talents had long been recognized in the profession. He had been repeatedly elected President of the American Institute of Architects, to whose interests he devoted the most earnest and wise attention, both in office and out of it; and was decorated many years ago with the cross of the French Legion of Honor. Later, the French, who seemed to have followed his career with an affectionate interest, which was fully returned on his part, raised him to the highest honor that could be bestowed on a foreign architect, by making him Corresponding Member of the Institute of France, in the Section of Fine Arts; and similar honor was recently done him on the other side of the Channel, by the Royal Institute of British Architects, in the award of the Royal Gold Medal.—*The American Architect and Building News.*

AN INTERESTING PIECE OF FOUNDATION WORK.

AN interesting piece of foundation-work has been going on in New York, at the corner of Exchange Place and Broad street, where a sixteen-story office-building is to be erected for the John Taylor Johnson estate, says *The American Architect and Building News.* The soil at this point is a stiff clay, mixed with gravel and boulders, and resting on rock, at a distance of about forty feet from the surface. As usual in New York, where such lofty buildings are to be erected in the lower part of the town, caisson foundations are used, but the method of sinking the caissons is novel. Instead of forcing air into them, so that the earth can be excavated under them, the work of sinking them is performed mainly by water-jets, directed in a very ingenious manner. Around the lower edge of the caissons, which are of the usual form, and proportioned in size to the weight which is to come upon them, are fixed hollow castings, each of which is pierced with a row of holes, about one-eight of an inch in diameter. Pipes, descending on the outside of the caisson, enter the castings, and convey to them water, at a pressure at a hundred pounds or more to the square inch. The water issues in jets from the holes in the castings, washing away the earth from under the edge of the caisson. Around the lower edge of a caisson of moderate size there are something like a thousand of these jets, and their combined effect loosens the earth so effectually as to allow the caisson to sink rapidly. The movement is hastened by loading the top with iron weights, and by exhausting the air from the interior; and it is said that a caisson can be sunk forty feet in about a day, including all the delays incident to testing and rectifying the movement, and riveting together the three sections of which each caission is made. As might be expected, the sections do not sink with perfect accuracy, and the work must be stopped at intervals to apply gauges, and modify the current through the water-jets, until the necessary correction is made. In most cases, this is all the rectification required, but when the descending edge of the caisson meets a large boulder, it is sometimes necessary to apply a special treatment, which consists in directing a jet of water upon the earth below the the boulder, and a little outside of it. This jet soon excavates a hole, into which the boulder falls by its own weight, out of the way of the descending caisson. After the caissons are sunk to the rock, they are excavated in the usual manner, the surface of the rock trimmed and leveled if necessary, and concrete and masonry put in, filling them to the top. As soon as the concrete has set, the foundation is ready to receive the superstructure. As usual with modern caissons foundations, the steel cylinder is intended to serve only as a form in which to mould the concrete pier, which is the real support of the building, so that the metal may corrode away at any time, after the concrete has set, without diminishing in the least the security of the structure. Compared with the older method of making caisson foundations, the new one, which is the property of the Hydraulic Construction Company, has great advantages in point of rapidity, the sinking of a caisson being a matter of a few hours, instead of several weeks.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.
SETH BABSON, Pres. GEO. W. PERCY, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
OCTAVIUS MORGAN, PRES. A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec't. AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

ARTIFICIAL WEATHERING TESTS OF BUILDING STONES.

A paper by Mr. Lea McI. Luquer in the Transactions of the American Society of Civil Engineers for March of this year raises a question in connection with the tests of building material which we discussed in these columns more than two years ago. As Mr. Luquer observes, the artificial testing of endurance of building stones exposed to the atmosphere, by means of the formation of crystals of some suitable substance in their pores, has for many years come to be regarded as satisfactory, although he raises the question which we pointed out in our former comments on this subject, whether the artificial procedure can be considered equivalent to the natural process of weathering. It is almost certainly not exactly equivalent, but we think it is a question well worth considering whether it is even approximately so. No theoretical considerations are sufficient for the determination of the physical forces developed or the changes produced in the material by them.

It is not impossible that small chemical reactions, at least, may take place in the material of some stones when treated by the sulphate of soda of similar processes, although it is improbable that such effects often result to an appreciable extent. Leaving out of account, however, all such influences, there still remains the fact that the destructive effects produced by the formation of ice in the small interstices of stone are almost certainly not identical with those induced by the formation of the crystals of such chemical substances as sulphate of soda. It may of course be said that while considerable inequality in these results may exist, yet the destructive effects of artificial crystallization may furnish a basis for a comparative or quantitative inference in regard to the weathering capacity of any given material. This is probably true, and the observations would possess practical value were there in existence actual data establishing the desired relation. As a matter of fact no such relation has yet been established for any stones, natural or artificial, and hence the results of artificial crystallization are, to a large extent at least, of suppositive value as establishing probable relative capacities among a given set of stones.

Again, there is a class of weathering effects due to the action of the sun and resulting from alternate expansions and contractions, to say nothing of slow possible chemical actions, of which no artificial process of crystallization can give us any measure. It is seem, therefore, that the latter class of tests fail in some very material characteristics of furnishing to the engineer such a measure of weathering endurance as he should desire or demand.

We do not make these observations in the line of hypercriticism, because we recognize the fact that the engineer, like everyone else, mu t always use the best means at his command to accomplish any desired end, although those means may fall very short of meeting the conditions which he fully recognizes. Mr. Luquer's admirable paper shows conclusively what has been at least partially recognized before—viz., that the sulphate of soda process is much more severe in its effects on the considerable number of stones which he tested than the same number of alternate freezings and thawings, and to an extent which varies widely with stones of different texture. While, therefore, the sulphate of soda and similar processes may and do give valuable information to the engineer in regard to certain weathering properties, and while such tests must necessarily in some cases be the only endurance tests available, their results should in all possible cases be supplemented by the effects of actual weathering exposure wherever possible. Indeed it is probable that there is no better measure of resistance to weathering by building stones, when available, than that exhibited by the outcrop of the quarries which have been exposed to all weathers and all seasons through perhaps centuries of time. On account of the varying qualities of stone in the same quarry this test is obviously unusually unavailable, but engineers with a very little forethought and trouble may accumulate in the course of a few years data in regard to the weathering properties of natural and artificial stone of a most valuable character by submitting specimens to continuous exposure under such conditions as will develope effects of sun, frost, and other influences which act on the exposed faces of buildings. The accumulated data of such investigations as that of Mr. Luquer, and others of a similar character, would then perhaps in time give us the desired relation between the artificial and natural methods. In the meantime provisional methods must be employed for what they are worth, but with caution, in the hope that both architects and engineers may give the subject much more attention than it has yet received.—*The Engineering Record*.

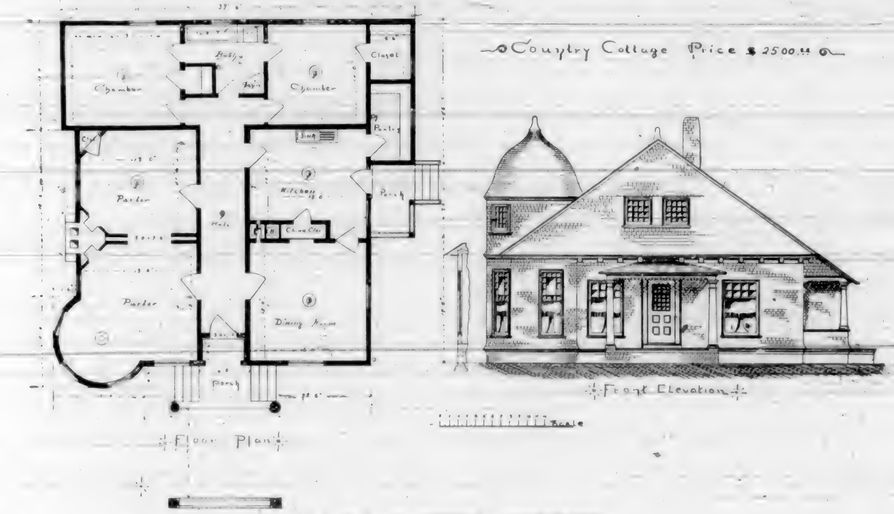
THE STONE-WORKER'S FUTURE.

IN looking forward to the probable developments of the next few years it appears to one who has personal contact with the pulse of invention, that we will make very great strides in the perfection of stone-working machinery of an entirely new type. There are, as it were, periods or waves of improvement. The pneumatic tool marks one of these waves, being one of the inventions that stamps its character upon every class of the industry. It marks an era in the craft. The time is fast approaching when we will feel another wave of progress, and it will also make its mark upon every class of the craft.

But a ten minutes walk through a modernly-equipped stone works reveals to the thoughtful mind, many places where both labor and time are wasted, and are unproductive. And as competition becomes more severe labor and time are the great items upon the expense side of the ledger, and anything that tends to save these becomes a chief factor in a successful business enterprise. Only a week or two

ago I had a long and interesting talk with the owner of one of the oldest and most important steam stone works of New York City, and the conversation turned mainly upon this very theme, the mechanical saving of labor and time in the dressing of building stone. When he was young in the business, good work was all that was needed to fill up a fat order book, but now it requires a close cost estimate. And this is truer as the years pass by.

In the first place, it occurs to a practical mind that the cutting of stone as it is done now is entirely too slow a process. And the machinery is too expensive by all means. From five to ten thousand dollars is entirely too much to spend for a saw cutting little more than a quarter of an inch per minute. Again, dimension work must be put through faster. The cuts should follow rapidly, and the measurements be made by mechanical means. Cutting and trying is a relic of the days when carpenters hewed beams with adzes. Measuring and squaring should be absolutely under



J. J. & T. D. NEWSOM, ARCHITECTS.

mechanical control. Gang work should be done at high speed. Planers must work faster and be automatically operated. Tools must be invented to do special work automatically from pattern, and without waste of stock. I expect to soon see arches cut without any waste of material within the segment.

In fact there are great lessons for the worker in stone to learn. Some of them can be found in any well-equipped wood-working shop, and in machine shops. Is there any reason why the same principles cannot be applied to the working of stone? It is not because stone is heavy, for in the Washington Navy Yard I have watched the handling of a hundred ton cannon with as much ease as though it were a Napoleon. Steel is as hard as granite. The real secret is that the inventive mind has not taken hold of the entire problem as yet. The rapid manipulation of stone will be a fact when proper attention is focused to that end.—*Edw. C. Weaver in Stone.*

A Weak mind is like a microscope, which magnifies trifling things, but cannot receive great ones.—*Chesterfield.*

BOOKS AND PERIODICALS.

We have before up the Catalogue of the EIGHTH ANNUAL EXHIBITION of the Chicago Architectural Club Art Institute, Chicago, May 23d to June 10, 1895. Among other illustrations is the competitive design for the gold medal of the Illinois Chapter A. I. A. by J. W. Johnson.

This Catalogue is neatly printed on good paper, many of the sketches are very creditable to the artist, and show that the club is doing good work in the cause of Art.

A new magazine called GRANITE, PRODUCER AND BUILDER, devoted to the interests of quarries, manufacturers and sculptors of granite and marble as used for monumental or building purposes. This magazine appropriately dressed in a granite color cover is published by Ladd, Hunt & Co., 131 Devonshire street, Boston, Mass.

It contains some handsome illustrations, among the number a panel carved in granite that makes a very striking figure, we should judge it must be a valuable work for those interested in this line.

COMPRESSED AIR and the Clayton Air Compressors, complete catalogue No. 8, Havemyer Building, Cortlandt, Church & Dey Sts., New York; it is not our custom to review trade catalogues, but make an exception in this case because of a valuable article upon "The Wide Use of Compressed Air" which the volume contains, calling attention to the many uses that at the present time compressed air is applied to that cannot fail to be of interest to constructing engineers.

PAINTING IRON BRIDGES is by Walter G. Berg instead of Walter G. Bery.

LEGAL DECISIONS.

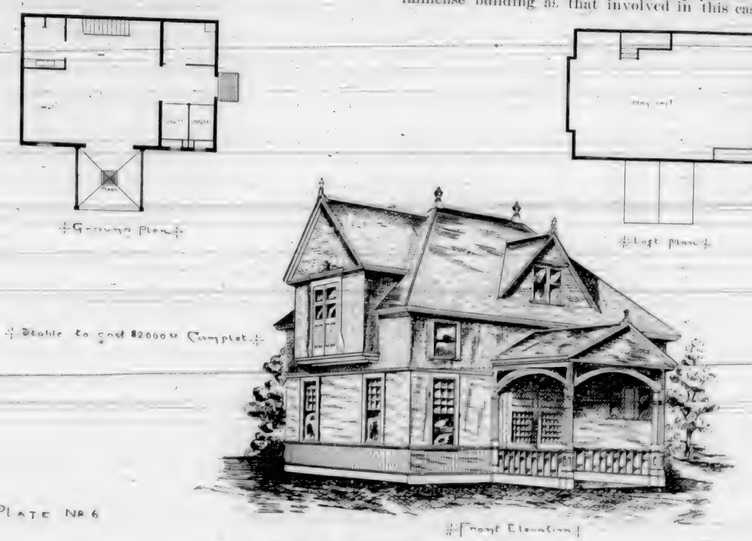
From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

When Order of Contractor Takes Precedence of Lien.—An order given by the contractor on the owner in good faith, and for a valuable consideration, before notice of a material man's lien is given, takes precedence of such lien.

Newman v. Levy, Supreme Court, General Term, Second Department, 32 N. Y. Sup. Rep. 557.

Statements of Contractor's Son.—A statement by a contractors's son, while working for his father, in the latter's absence, that the time for filing a mechanic's lien for certain work had expired, does not bind the father, where the son was not authorized by him to make the statement.

Alexandria Bldg. Co. v. McHugh, Appellate Court of Indiana, 39 N. E. Rep. 877.



J. J. & T. D. NEWSOM, ARCHITECTS.

Accepting Service of Notice.—In proceeding by the original contractor to enforce a mechanics' lien against the owner of the land, no rights of subsequent purchaser intervening, the owner by accepting service of a copy of the statement in lieu of the statutory service, before the time had elapsed within which the statutory service could have been made, is estopped to assert that the service was not made in the statutary manner.

Mount v. Fisher, Supreme Court of Michigan, 62 N. W. Rep. 338.

Iron Building Construction.—The thirteenth claim of the Buffington patent, for "improvements in iron-building construction," being "the combination, with the posts and girts, of the angle plates connecting them, and forming supports for the veneer shelves," does not include a claim for the idea of supporting horizontal sections of masonary veneer on the iron framework of a building, or the combination of such veneer and the shelves supporting it with the iron frame, merely because shelves and veneer supported thereon in horizontal sections are described in the specifications of the patent.

Buffington's Iron Bldg. Co. vs Eustis, Circuit Court of Appeals, Eight Circuit, 65 Fed. Rep. 804.

No Lien for Damages for Breach of Contract.—Under the laws of New York, a contractor has no lien for damages sustained by him by reason of a breach of contract by the owner, but is confined to the value of his labor and the materials furnished.

Wolf v. Horn, Com. Pl. N. Y. City, 33 N. Y. S. Reporter, 173.

Measure of Damage for Failure to Complete Contract.—When a contractor fails to complete a building, and the owners take possession and do so, the measure of damages will be the amount of the paid contract-price, less the fair and reasonable amount the owner had to pay to complete the work.

Mills v. Paul, Ct. Civ. App. Tex., 30 S. W. Reporter, 559.

Architect's Lien for Preparing Plans, etc.—The Circuit Court of the United States (Northern Dist. Ohio,) has decided that, a statute giving a lien to a person "who performs labor or furnishes machinery for erecting, altering, repairing or removing a house by virtue of a contract," etc., includes not merely those performing manual labor, but extends to the labor of an architect in preparing plans and specifications, and in superintending construction, where it appears that such plans and specifications were prepared with a view to the particular location where the building was actually located, and in pursuance of a contract having a substantial financial basis.

The Judge said:—"There is no reason in equity or law why the architect who conceives and puts upon paper the design of such an immense building as that involved in this case, and who puts upon paper with such minuteness of detail the specifications and drawings as to enable any one skilled in such business to erect, with perfect proportions and proper stability, such a mammoth structure, should not be protected in his contribution to the completion of such work, as well as the carpenter, the plumber, the painter, or any one who performs manual labor.

"The Court ought certainly not to strain the statute to exclude labor of this high character and grade, unless it is plainly the intent of the legislature that it should bear such interpretation. The architect in this case is entitled to a lien not only for the plans and specifications, but for the labor and assistance in the construction of the building in pursuance of these plans."

Phœnix Furniture Co. v. Put-in-Bay Hotel Co., 66 Fed. Rep. 635.

Attorneys' Fees for Securing Lien.—The Supreme Court of Montana holds that: A law providing that in an action to enforce mechanics or other liens, the party if successful shall recover a reasonable attorney's fee and costs is constitutional.

Helena Steam Heating & Supply Co. v. Wells, 40 Pac. Rep. 78.

Occupation Tax on Architects.—Acts 1883, imposing an occupation tax on architects, was not repealed by Acts 1889, or by Acts 1891, both of which provided for state and county revenues. The occupation of an architect can be made the subject of a privilege tax.

Cook v. City of Memphis, Supreme Court of Tennessee, 30 S. W. Pap. 742.

BUSINESS MOSAICS.

Rock Asphalt—In another part of this issue will be found an advertisement of a quantity of the celebrated and widely known Neuchatel Rock Asphalt Mastic, which is so extensively used in New York, Chicago, and all the other large Eastern cities, as well as in Europe, for laying side walks, fire proof floors, etc. It is peculiarly adapted for water tight floors in stables, sanitary cellars, and for other similar work, and anyone desiring an article that will meet their requirements for the above purposes cannot do better than by using this asphaltum.

The lot now offered for sale is the genuine product from the Neuchatel Valley, Switzerland, and is the balance of a shipment received here some time ago, but parties ordering having failed, it has been held in store pending sale. Owners having determined to dispose of this balance at an early date, have now authorized their representatives here, Messrs. Williams, Brown & Co., 116 California St., to make a specially low figure to that end. The attention of all in the trade is drawn to this article as the cheapest and best for the purposes above stated.

Wife—"Dear, dear! What can you be dropping oil on your best coat for?" Husband—"I bought a bottle of stuff to-day to take out grease stains with, and I wanted to see if it was any good."—*News Letter.*

As the windy season is almost over it is time to think of having your house repainted, therefore a few facts about paints do not come out of place. The Phœnix pure paint, manufactured by W. P. Fuller & Co., is certainly an article that fills the bill; its extensive use upon the Pacific Coast for the last five years proves that it is what is claimed to be by the manufacturers. Without pure materials how can you expect good work? Note what is guaranteed: "Absolutely pure and satisfactory on the building or we will replace it with any material the architect may select."

New Customer—"Is that your dog?" Barber—"Yes, sir." New Customer—"He seems very fond of watching you cut hair." Barber—"It is not that, sir. Sometimes I make a mistake and take a little piece of a gentleman's ear.—*Tit-Bit.*

The fact that cement has been gaining in favor for foundations, sidewalks, etc., is self evident to every one interested in the welfare of our city. When you order cement why not order the best, to this end why not order from W. R. Grace & Co., 203 California street, you will certainly be satisfied with "Josson" or "White Starr," but as you pay your money you can take your choice of many other brands they have on hand.

"What a talker Mrs. Frakshus is!" exclaimed Mrs. Dinwiddie. "Yes," replied Mr. Dinwiddie; "even her teeth chatter."—*Life.*

A. Steiger Sons.—This concern has proved itself fire proof, for notwithstanding the destruction of their works by fire, business has been continued with renewed energy, any thing in the way of Architectural Terra Cotta, etc., will be found in stock, or manufactured to order. Orders can be left at the office in San Jose, Postoffice Box 1025, San Francisco office, Builders' Exchange, Post street, room 16.

Heating and Ventilation, 27 New Montgomery street. Mr. Wright having purchased his partners interest will continue to furnish estimates for the heating and ventilation of buildings of any size, either by steam, hot water, warm air, or by combination of hot water and warm air. As the importance of good ventilation, combined with a comfortable heat is daily becoming more in use, people desiring pure air are more inclined to pause before ordering a hot air furnace, the right thing to do is to consult some one who makes a business of this art, surely it is an art; Mr. Wright is the man to apply to. Judge Murphy might not now be on the sick list, if Mr. Wright had ventilated the Court Room.

Mr. Brice must have lost his hat. He is now talking through his secretary.—*Cleveland Leader.*

If you need water only when the wind blows; if you are satisfied to utilize but a small fraction of the water in your well, if you prefer heavy bills for repairs after each storm in winter, by all means use a windmill; but if you want water at any time, and up to the full capacity of your well, put in the Ajax Coal Oil Gas Engine, the latest thing in mechanics, an engine that uses common coal oil for fuel, and is built by the well known firm of Palmer & Rey, San Francisco, Cal.

He—"My views of bringing up a family are—— She—"Never mind your views; I'll bring up the family; you go and bring up the coal."—*Halifax Herald.*

San Francisco Lumber Co., wholesale and retail; the readers should be reminded that their principal office has been removed to the foot of Third street, uptown office for orders 405 Montgomery street, cor. California. The yards, foot of Third and Channel streets south side bet. Fourth and Fifth streets, contain almost everything the contractor and builder may require, the fact that Mr. J. N. Curtis is manager is enough to insure fair treatment and prompt delivery of orders.

The Teacher—"Now, who can tell me which travels the faster, heat or cold?" Johnie Bright (promptly)—"Heat, of course. Anybody can catch cold."—*Pathfinder.*

W. W. Montague & Co. is the place to go, if you wish anything in the way of mantels, grates or tiles. Before you leave their establishment it will be well to look over the large stock of most everything in the way of heating apparatus; it may be hard to make a choice among so many desirable articles that add to the comfort of house-keeping, but when you leave the store you will go with the idea that San Francisco has establishments equal to any other city.

Architect's Wife—"What makes you so bad tempered to-night, John?" Architect—"I don't know; unless it is because I was drawing some cross-sections this afternoon."—*Drake's Magazine.*

The Improved Chapman Fire Hose Real is what you want if you want the best. At 14 and 16 Fremont street you will find Mr. R. S. Chapman, late Fire Surveyor for Board of Underwriters, what he doesn't know about hose is not worth knowing. Call and be convinced.

CITY BUILDING NEWS.

All work for schooner for the American Board of Commissioners for Foreign Missions; architect, Hugo P. Frear; contractor, Geo. W. Knoass; signed, July 3; filed, August 2; cost $4250.

Bartlett near 22d. To build; owner, M. J. Dempsey; contractor, H. Munster; signed, July 20; filed, July 25; cost $2400.

Belvedere near Fredrick. To build; owner, W. Hinkle; architects, Hermann & Swain; contractors, Peterson & Person; signed, Aug. 8; filed, Aug. 9; cost $3075.

Bluxome near Fourth. To build; owner, J. F. Hill; architect, E. A. Garin; contractor, D. R. W. Smith; cost $4000.

Bluxome near Fourth. Stable buildings; owner, Overland Freight and Trans. Co.; architect, S. O'Brien; contractor, M. Bagey; cost $1800.

Brannan near Fourth. To build; owner, A. Steinmetz; contractor, W. Bell; cost $900.

Brannan near Fifth. Mason work, etc., on brick warehouse; owner, Ed. Niehaus; architect, B. J. Clinch; contractor, J. Wagner; signed, July 13 filed, July 15; cost $2500.

Brannan near Fifth. Furniture factory; owner, C. Reichling; contractor, C. Klein; cost $2000.

Brannan near Fifth. To build; owner, F. Huber; contractor, F. W. Steinmann; cost $2000.

Brannan near Fifth. To build; owner, R. Herring; contractor, M. J. Gallagher; cost $2000.

Brannan near Fourth. To build; owner, Herman Harms; architects, Martens & Coffey; contractor, J. Bucher; signed, Aug. 6; filed, Aug. 7; cost $7240.

Bryant near Tenth. Engine House; owner, City of San Francisco; contractor, W. H. Wickersham; cost $5345.

Bryant near Centre Place. Alterations and additions; owner, Jas. Mahoney; architect, J. E. Krafft; contractor, P. J. Brennan; signed, July 22; filed, July 24; cost $1398.

Bryant near 23d. Cottage; owner, Bessie J. Hetzer; architects, Hermann & Swain; contractor, H. Jacks; signed, July 16; filed, July 16; cost $1582.25.

Bryant near Fifth. Brick building; owner, John Horstmann; architect, H Geilfuss; contractors, Miller & Beck; signed, July 17; filed, July 17; cost $3695.

Bryant near Fifth. Carpenter and iron work; owner, John Horstmann; contractors, Hood & Watson; signed, July 17; filed, July 17; cost $4675.

Broadway near Gough. To build; owner, Mrs. Maggie Hockstadter; architect, M. J. Lyon; contractor, R. Sinnott; filed, July 24; filed, July 24; cost $6200.

Bush near Laguna. Mill work on church; owner, Congregation Ohabae Ohalome; architect, M. J. Lyon; contractor, H. Rohling; signed, July 3; filed, July 18; cost $2800.

California and Montgomery. Iron work; owner, Cal. Safe Deposit & Trust Co.; architect, H. A. Schulze; contractors, Union Iron Works; signed, June 24; filed, July 13; cost $17 171.

California and Montgomery. Boilers, engines, etc.; owners, Cal. Safe Deposit & Trust Co.; architect, H. A. Schulze; contractors, Risdon Iron & Locomotive Works; signed, June 24; filed, July 13; cost $3800.

California and Montgomery. Sidewalk lights; owner, Cal. Safe Deposit & Trust Co.; architect, H. A. Schultz; contractors, Keatinge, Leonard & Co.; signed, June 5; filed, July 27; cost $3630.

California and Baker. To build; owner, Kate A. Adams; contractor, W. W. Redhall; signed, Aug. 2; filed, Aug. 3; cost $3575.

Caselli Ave. To build; owner, J. A. Bigger; contractor, Josiah J. Rose; signed, July 31; filed, Aug. 3; cost $1420.

Chattanooga St., No. 12. Additions; owner, P. Coughlan; contractor, T. C. Cochrane; cost $1000.

Cherry near Sacramento. To build; owner, P. A. Peshon; architect, August Lund; contractors, Dahlberg & Lund; signed, July 20; filed, July 22; cost $3500.

Cliff House. Enclosing porches with glass; owner, Adolph Sutro; contractors, Campbell & Pettus; signed, July 25; filed, July 25; cost $2770.

Cliff House. Extra floor in attic; owner, Adolph Sutro; contractor, Campbell & Pettus; supplement to contract filed April 13; cost $420.

Cliff House. Diagonal boarding; owner, Adolph Sutro; architects, Colley & Lemme; contractors, Campbell & Pettus; cost $1661.

Clipper near Sanchez. Cottage; owner, Geo. S. and Annie Knowles; architect, T. J. Welsh, contractor, J. W. Coburn; signed, Aug. 7; filed, Aug. 8; cost $1875.

Colma Creek. Excavations, etc.; owner, Spring Valley Water Works; architect, Chief Engineer of Co.; contractor, A. E. Buckman; signed, Aug. 9; filed, Aug. 9; cost 9 cts. per cubic yard.

Diamond near 17th. To build; owner, Andrew Norin; architects, Hermann & Swain; contractor, R. Trost; signed, July 17; filed, July 17; cost $1750.

Dolores near 25th. To build; owner, J. M. Robinson; contractor, Chas. Koenig; signed, July 17; filed, Aug. 2; cost $3150.

Fell near Pierce. Alterations; owner, C. Westphal; architect, A. C. Lutgens; contractor, A. G. Johnson; signed, July 24; filed, July 26; cost $3158.

Fell near Gough. To build; owner, Peter Kelly; architect, W. H. Armitage; contractors, Wheeler & Perry; signed, Aug. 2; filed, Aug. 5; cost $3825.

Fourth and Freelon. To build; owner and architect, O. W. Kenitzer; contractor, Adam Miller; cost $4000.

Fourth near Brannan. To build; owner, H. Goecken; architect, H. D. Mitchell; contractor, Geo. Lack; signed, July 20; filed, July 23; cost $4320.

Fourth street, No. 610. To build; owner, A. Robins; contractor, L. Westerlund; signed, July 31; filed, July 31; cost $2630.

Fourth near Bluxome. To build; owner, A. Roberts; contractor, Westerlund; cost $2000.

Fourth near Welsh. To build; owner, M. Daliner; contractor, R. Rechenback; cost $800.

Fourth Ave. near Point Lobos. To build; owners, T. Morrow and wife; contractor, P. Fredriksen; signed, Aug. 6; filed, Aug. 3; cost $1250.

Geary near Hyde. Alteration except plumbing and painting; owners, Annie and Katie M. Butler; architect, J. T. Kidd; contractors, Cannan & Mooney; signed, Aug. 5; filed, Aug. 6; cost $3112.

Hampshire near 10th. Stable; owner, City of S. F.; architect, C. R. Wilson; contractors, Doyle & Sons; cost $12,873.

Howard near 9th. To build; owner, E. Campini; architect, R. A. Herold; contractor, E. Picapo; signed, July 30; filed, Aug. 1; cost $3275.

Jackson and Webster. To build; owner, T. J. Tiekenor; architects, Mahoney & Ryland; contractor, J. J. Dunn; signed, Aug. 7; filed, Aug. 8; cost $1250.

Jones and Sutter. Five story brick; owner, Dr. M. Herzstein; architect, M. J. Lyon; contractor, Wm. Knowles; signed, July 27; filed, July 31; cost $26,500.

Locust near Sacramento. To build; owner, D. T. McArthur; contractor, C. Zwierlein; signed, July 23; filed, July 24; cost $3400.

Market near Spear. Brick building; owners, Macdonough Estate; architect, H. A. Schulze; contractors, Mahoney Bros.; cost $15,000.

Market near Fifth. Electric light wiring; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, E. H. Frost; signed, July 24; filed, Aug. 5; cost $32,926.

Market near Fifth. Folding gates, etc; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractors, Coppetiers & Mockel; signed, Aug. 5; filed, Aug. 6; cost $9.45 per running foot, about $12,000.

Market near Fifth. Elevators, etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractors, Coppetiers & Mockel; signed, Aug. 1; filed, Aug. 5; cost $5400.

Market near Stockton. Alterations and additions; owner, I. Magnin; architect, A. J. Barrett; contractors, Ackerson & Paterson; signed, Aug. 6; filed, Aug. 6; cost $150.

Market near Powell. Brick building; owner, Claus Spreckles; architects, Reid Bros.; contractor, C. Ferris; signed, July 10; filed, Aug. 2; cost $8000.

Market near Powell. Carpenter work o nbrick; owner, Claus Spreckles; architects, Reid Bros.; contractor, J. W. Hansbrough; signed, July 15; filed, Aug. 2; cost $5300.

Market near Powell. Pressed brick and terra cotta work; owner, Claus Spreckles; architects, Reid Bros.; contractors, Gladding, McBean & Co.; signed, July 12; filed, Aug. 2; cost $2270.

Market near Powell. Plumbing, etc.; owner, Claus Spreckels; architects, Reid Bros.; contractor, W. F. Wilson; signed, July 10; filed, Aug. 2; cost $1005.

Market near Powell. Plastering; owner, Claus Spreckels; architects, Reid Bros.; contractor, Thos. Mannix; signed, July 23; filed, Aug. 2; cost $1085.

Market near Powell. Roof and iron work; owner, Claus Spreckels; architects, Reid Bros.; contractor, Philip Hammond; signed, July 10; filed, Aug. 2; cost $885.75.

McAllister near Hyde. Carpenter work and plastering; owners, California Bible Society; architect, McDougall & Son; contractor, J. H. McKay; signed, July 20; filed, July 20; cost $20,190.

McAllister near Hyde. Brick, stone and terra cotta work; owners, California Bible Society; architects, McDougall & Son; contractor, M. McGowan; signed, July 20; filed, July 20; cost $9889.

McAllister near Hyde. Concrete foundations; owners, California Bible Society; architects, McDougall & Son; contractors, Gray Bros.; signed, July 20; filed, July 20; cost $5329.

McAllister near Hyde. Plumbing and gas fitting, etc.; owner, California Bible Society; architects, McDougall & Son; contractor, H. Williamson; signed, July 20; filed, July 20; cost $2612.

McAllister near Hyde. Painting, graining, etc.; owner, California Bible Society; architects, McDougall & Son; contractor, W. T. Beck; signed, July 20; filed, July 20; cost $820.

Montgomery near Green. To build; owner, G. Capurro; architect, E. Deplerre; contractor, A. Norton; signed, July 16; filed, July 18; cost $6415.

Moss near Howard. To build; owner, J. Saunders; architect, D. C. Coleman; contractor, J. Kenealy; signed, July 12; filed, July 18; cost $2175.

Natoma near 5th. Brick building; owner, Louis Dipery; contractors, J. B. Gonyeau & J. Miron; cost $1200.

New City Hall. Steel work for tower; owner, City of San Francisco; architect, Frank T. Shea; contractors, Fennell & Son, cost $7396. Corrugated iron, work, contractor, J. H. McKay, cost $2240. Terra cotta, etc.; contractors, Gladding, McBean Co.; cost $2625. Shelving in Law Library; contractor, W. G. Hughes; $891.

Oak near Scott. To build; owner, D. F. Shea; architect, J. J. Clark; contractor, Holm & Shelbley; signed, July 24; filed, July 29; cost $4807.

O'Farrell near Octavia. Carpenter work; owner, Geo. Haas; architect, J. H. Littlefield; contractor, Robert Smilie; signed, July 11; filed, July 17; cost $5650.

O'Farrell near Octavia. Plumbing; owner, Geo. Haas; architect, J. H. Littlefield; contractor, H. Williamson; signed, July 11; filed, July 17; cost $1085.

O'Farrell near Stockton. Alterations and additions; owner, Hyman Bros. Co.; architects, Percy & Hamilton; contractors, Ingerson & Son; signed, July 31; filed, July 31; cost $1595.

Pacific near Jones. Engine house; owner, City of San Francisco; architect, C. R. Wilson; contractor, W. H. Wickersham; cost $14,948.

Perry near Third. To build; owner, J. J. Cass; contractor, A. Klahr; signed, Aug. 3; filed, Aug. 5; cost $2320.

Pennsylvania Ave. near Colusa. Cottage; owners, Chas. H. & Gesine Kaster; architect, D. C. Coleman; contractor, John T. Coleman; signed, Aug. 4; filed, Aug. 6; cost $1400.

Pierce near Union. To build; owner, G. E. Thompson; architects, Martins & Coffey; contractor, James Mooney; cost $2495.

Pine and Steiner. To build; owner, Mrs. E. M. Stewart; architect, C. J. Colley; contractors, Dunford & Kronnick; signed, Aug. 2; filed, Aug. 3; cost $5320.

Power House. Engines and boilers, etc.; owner, Sutro R. R. Co.; architect, J. C. H. Stut; contractors, Fulton Engineering Works; signed, July 30; filed, Aug. 1; cost $36,398.

Post and Powell. Alterations and additions; owner, G. F. Davis; contractors, Robinson & Gillespie; cost $3000.

Polk street No. 1217. Additions; owner, S. B. Denkelspiel; contractors, Robinson & Gillespie; cost $1200.

Sacramento near Gough. To build; owner, M. G. Weed; architect, Reid Bros.; contractors, W. S. Veitch & Bro.; signed, July 18; filed, Aug. 2; cost $5398.

Sacramento and Laguna. Carpentering, plastering, etc.; owner, H. L. Hill; architect, W. J. Mathews; contractor, J. A. Smillie; signed, July 23; filed, July 27; cost $10,775.

Sacramento and Laguna. Concrete and cement; owner, Horace L. Hill; architect, W. J. Mathews; contractors, Keatinge, Leonard & Ransome; signed, July 22; filed, July 26; cost $1000.

Sanchez and 22d. To build; owner, L. Bergerat; architect, G. A. Berger; contractors, Klein & Eickholt; signed, July 31; filed, Aug. 2; cost $2100.

Second Ave. near Clement. Cottage; owner, Geo. F. Lyon; contractor, W. W. Rednall; signed, Aug. 8; filed, Aug. 9; cost $2100.

Steiner and Grove. Carpenter work; owner, E. Probert; architects, Pissis & Moore; contractors, Gardner & Boyden; signed, July 3; filed, July 17; cost $5621.

Steiner and Grove. Plumbing; owner, E. Probert; architects, Pissis & Moore; contractor, Ickelheimer & Bro.; signed, July 3; filed, July17; cost $1137.

Steiner near Oak. To build except plumbing; owner, Mary A. Fuller; architect, Shea & Shea; contractor, R. Trost; signed, July 13; filed, Aug. 6; cost $3723.

Seventeenth near R. R. Ave. To build; owner, Henrietta Warsdale; contractor, Marcuse & Remmel; signed, July 18; filed, July 20; cost $1475.

Sixteenth near Valencia. To build; owner, Mary Harmann; architect, H. Hess; contractors, Weirochi & Franz; signed, July 31; filed, July 31; cost $9,300.

Stockton and Francisco. Engine House; owner, City of S. F.; architect, C. R. Wilson; contractor, W. H. Wickersham; cost $14,948.

Sutter and Grant Ave. Additional story; owner, Macdonough Estate; architect, A. Page Brown; contractors, Mahoney Bros.; cost $10,000.

Third Ave. near Lake. Cottage; owner, G. S. Conroy; contractor, B. J. Taylor; signed, July 19; filed, July 22; cost $1650.

Twenty-second near York. Cottage; owner, Rose Lafee, contractor, J. Kenealy; signed, Aug. 7; filed, Aug. 9; cost $1050.

Twenty-third near Noe. Cottage; owner, Peter McDevit; contractor, W. W. Rednall; signed, July 16; filed, July 16; cost $1100.

Twenty-third near Noe. To build; owner, Mary McDevit; contractor, W. W. Rednall; signed, July 16; filed, July 16; cost $2700.

Turk street No. 314 and 324. Alterations and repairs; owner, Emilie Haller; architects, Wright & Sanders; contractor, J. S. Mackey; signed, July 15; filed, July 17; cost $3610.

Turk near Buchanan. To build house and stable; owner, Wm. F. Wilson; contractor, F. C. Bell; signed, Aug. 6; filed, Aug. 6; cost $6000.

Union near Fillmore. To build; owner, Mrs. J. Ryerson; architect, F. P. Rabin; contractor, J. A. McDonald; signed, Aug. 2; filed, Aug. 5; cost $2688.

Washington near Octavia. Additions and alterations; owner, R. B. Furman; architect, W. J. Mathews; contractor, J. A. Smilie; signed, July 26; filed, July 27; cost $1997.

Welsh near 4th. Additions; owner, Mrs. Deagan; contractor, T. F. Mitchell; cost $800.

Welsh near Fourth. Repairs; owner, Estate of R. White; architect, R. H. White; contractor, D. H. Matheson; signed, July 17; filed, July 17; cost $1900.

Willow Ave. near Buchanan. To build; owner, Annette Reinochel; architect, H. D. Mitchell; contractor, Geo. Lack; signed, Aug. 8; filed, Aug. 9; cost $2950

York near 21st. Cottage; owner, Bridget McDermott; contractors, Blanchard & Clark; signed, July 26; filed, July 27; cost $1575.

York near 21st. To build; owner, T. E. Brown; contractor, T. C. Cochrane; cost $3500.

THE chaotic condition of the ordinances regulating the construction of buildings in the City of San Francisco is a disgrace to any community with any pretense to civilization.

The original ordinances were framed in 1888 and have since been amended, added to and modified so many times that it would take the traditional Philadelphia lawyer to make head or tail out of the resulting tangle.

Several times in the last few years attempts have been made by the Chapter of Architects, the Chief of the Fire Department, and the Board of Supervisors to frame a complete and comprehensive order to take the place of the present disjointed and fragmentary series of orders that are a serious annoyance and source of confusion to architects, owners and contractors alike, but each attempt has only resulted in failure and the situation has been continually changing for the worse. New methods of construction are being continually introduced, and improved methods and materials are taking the place of the antiquated ideas of former generations; to meet these modern requirements should be the aim of our legislators, yet in place of keeping abreast of the times, and stimulating the progress of invention, that progress is retarded and confined by the swaddling clothes of infancy which should have been discarded years go.

Chief Sullivan of the Fire Department is now attempting to pursuade the Board of Supervisors to give their consideration to this matter, and a petition is being circulated by the architects designed to aid him in his attempt to impress on our City Fathers the importance and necessity of some action being taken with as little delay as possible. Many months time has been devoted to the preparation of a satisfactory ordinance by professional men competent to pass on the many questions involved, and at last an ordinance has been drafted that it is believed will satisfy the different requirements of all the interests concerned. Doubtless there are clauses that are open to objection, but taken as a whole there is no question but it will prove a great improvement on the existing laws, and will give the Architects and Builders the positive knowledge of what is not permissible, which it is so difficult to obtain at present, and thus remove many causes of contention that frequently disturb the harmonious relations that should exist between the property owner, the Fire Department, the Insurance Companies and and the Architect.

PROPOSED NEW CITY HALL FOR OAKLAND.

THE following extracts from the Architect's Report to the Oakland Officials gives a description of the building, and the method proposed to be used in raising money to build same.

The key note to the plan lies in the fact that Washington street, which is now blocked by the present City Hall, is desired to be continued through the City Hall lot and so on to San Pablo Ave. The design allows this and at the same time preserves the *coup d'œil* which all public buildings should have, *i. e.*, a position at the end of a street. The street is continued full width through the building—which is carried over it by arches of colossal proportions, this curtain between the two wings being surmounted by a Tower.

The ground floor is occupied by stores. The arch over the roadway is carried through two stories so that there will be no communication between the wings on the second story. One of these wings on this floor being devoted to a Public Library and the other to the Council Chamber, no communication is necessary.

By this arrangement the Library is entirely separate from rest of building—which is necessary—and the Council Chamber, and the crowds attending on its sessions, are secluded from what might be called the Administrative Offices—which is desirable.

The whole of the third floor is devoted to the offices—while the fourth floor is at present to be left vacant until such time as its space is required by the offices of electric and gas lighting, water works, street railways and other public utilities which will some time be under the control of the Municipality.

Meanwhile the space is proposed to be used for a Public Gymnasium—for public conveniences—and promenade on top of the curtain building.

Two fast elevators would be used one for each wing, and the main entrances would be under the archway in Washington street.

As to the method of raising money to build this Municipal Palace it is proposed to do so by the following means:—

The cost of erecting a fire-proof building would be about $500,000—for which bonds would have to be issued payable in twenty years. They are to be issued in small denominations as low as five dollars. These would be taken up by the people at three per cent interest as has already been proved at Philadelphia.

The building would take say four years to build, so that $125,000 of bonds would be issued every year—at end of the first year would be due one-twentieth of $125,000 or $6,250 and interest $3,750.

Second year there being another issue of $125,000 there would be due $12,500 and interest and so on to the end of the third year when the stores would be ready for occupancy.

There are sixteen stores, each would let for $100 per month, altogether $1,600 a month, $19,200 per year, say $19,000; so that at end of fourth year or at completion of building the amount would stand thus:—

Payable on $487,500 bonds outstanding, one-twentieth	$21,875
Interest on same at three per cent	13,125
	$35,000
Deduct rent of stores	19,000
Balance to be paid at end of fourth year	$16,000

Thus it is seen that the interest is all paid by rent and we have $2875 to carry to general municipal expenses or to pay off principal by loaning out the Sinking Fund at three per cent to the people instead of paying into General Fund; before the end of sixteen years the whole $500.000 will be paid off and the City will be having an income of $19,000 per year or whatever more the stores will rent for at that time. We will not burden our readers with figures to prove this, but it is so.

This is supposing these bonds are presented every year for redemption. I believe however that the mechanics, architects and superintendents would be glad to receive one-half of their pay in these bonds—especially if the shopkeepers would receive the same in payment for goods and if they refused the city could make arrangements by which the men could get provisions, etc., for these bonds.

They would be found so convenient however as money that very few would be presented for cashing at the City Treasury and as the interest would die out as the bonds matured, this would inure to the benefit of the City so much and the burden upon the city at any time would be but little.

REPORT OF THE CONSULTING ARCHITECT ON THE PLANS OF A. PAGE BROWN FOR THE NEW UNION DEPOT AND FERRY HOUSE.

SAN FRANCISCO, Sept. 10, 1895

To the Honorable Board of State Harbor Commissioners.

GENTLEMEN:—In compliance with instructions received from your President, on August 28th, we have examined the plans and specifications prepared by A. Page Brown for the proposed Union Depot and Ferry House, with a view to suggesting any modifications that might be better adapted to the use of California materials, and an economical application of the same.

To receive a complete set of drawings and specifications from Mr. Brown, who has also extended every courtesy and facility for examining into the details of the work.

We would say in general we find the plans of the building very complete, and we think well adapted to the objects for which it is designed.

The most important point in which we would differ from the opinion of the designer, is the unit of floor loads to be assumed as a factor for estimating the strength of floor beams, girders and supporting columns.

The plans for metal work as prepared, are estimated to carry with safety, something in excess of 225 pounds per square foot of floors throughout, including Mezzanine floors and the fourteen floors in tower. As the constant weight of beams, tile arches and cement or mosaic floors will be about ninety pounds per square foot it leaves about 135 lbs., per foot for the estimated superimposed load.

The greatest load that can possibly be put on these floors at any place, when used for its legitimate purpose, is a crowd of people, and as people cannot be crowded so as to weigh over eighty pounds to a square foot of floor surface, we think that is all that should be calculated for, or after adding, say, ninety-five pounds for weight of floor, using 175 pounds as the unit of safe floor load.

As this safe load is supposed to have a factor of safety of four for the breaking strength, it follows that it would require a superimposed load of about 600 pounds per foot to break down such floors, or one-half of that amount to strain the material to their elastic limit, and as its greatest load

can be only eighty pounds, it would seem that the margin was abundant.

We would, therefore, suggest that the thickness of metal in beams, girders and columns, be reduced to meet such requirements.

In regard to the beams being furnished by local rolling mills we would observe the spans throughout are about twenty-eight feet, and for any assumed floor load, twenty inch beams are more economical than those of less depth. Our local mills are not prepared to roll beams over fifteen inch in depth. These, if used in the work, would require approximately twenty per cent more metal than would twenty inch beams.

If fifteen inch beams are allowed to be estimated on, the field of competition would be widened, and possibly the price per pound might be less than for twenty inch beams. The cost of the work will doubtless be greater with fifteen inch beams than with twenty inch beams.

We would recommend reducing the weight of tower walls and floors as suggested by Engineer Holmes.

The building as now designed, has skeleton steel construction throughout, except at the front facade.

We believe it would be advisable to put in Z bar columns in the front, and thereby make the entire frame independent of the walls.

The plans are prepared for cast iron columns in the first story, while the specifications give the contractors the privilege of substituting Phœnix steel columns.

As these are to be exposed to the atmosphere and all sorts of wear and conditions, we think cast iron is best for the purpose and they can be produced here without difficulty.

We should remove that choice from the specifications, and require cast iron columns as designed.

The tower Z bar columns, we would require in two story lengths, breaking joints at alternate stories, and put together with fish plates, with the bracing and other parts as on the strain diagram prepared by Mr. Holmes.

As to the general design and details of walls, the plans are worked up for pressed bricks and terra cotta, with a granite base. These materials we consider the most appropriate and economical for clothing and protecting steel construction from the effects of the elements, including fire.

Alternative plans are prepared for stone and bids will be invited for various kinds of that material. If stone were used, the building would appear more monumental and impressive.

We would recommend the cellular constructions in either case, and the proposals submitted will doubtless form the basis of your decision as to the materials to be used.

We shall hope to see glazed bricks used for lining inside walls, corridors, etc., as designed, although alternative bids are to be taken for pressed bricks.

In regard to the scheme of thin marble veneering as proposed by Mr. Pelton, we would say we consider the method in general is practicable and perfectly feasible, if performed with faithful skill and care, and every precaution taken to overcome possible defects.

The vertical joints at angles should be disguised by small reentrant angles, or in quirks of beads, or other manner.

The metal adjustable anchors holding the slabs to the steel frame, should be of some metal or alloy not liable to corrosion, and should extend upward from the joints to the frame, across the air space, so as not to conduct water to the steel frame.

The greatest care should be exercised to fill the joints both vertical and horizontal, with good cement, and after every precaution is taken, we believe some water would find its way through the lofty exposed sides of the tower, and in such places copper gutters should be arranged in the air space above the roof of main building, to catch such leakage, and conduct it out over the main roof.

While we believe buildings may be faced up in this manner to last as long as any portion, we do not feel like recommending it on so large a scale and on such an important building in such an early stage of the methods development. Its cost and probability of getting material within reasonable time, will also be factors in your final decision.

In regard to the Portland cement used for brick and concrete work, we think an excess amount is specified. We would suggest for the mortar used in brick work, one part of cement to four parts of lime mortar, made in the usual manner, with North Beach sand; and for the concrete filling and lower portions of floors, one part of cement to nine or ten of properly selected aggregates. And in all cases, we would urge as very important, that the Board of Harbor Commissioners furnish the cement and not the contractors.

Otherwise it will require the constant watchfulness of a superintendent to get one-half of the above amount of cement in the mortar for brick work. With the Board furnishing the cement, the proportions may be changed by the Architect or Superintendent, when it appears desirable, without loss or profit to the contractor.

Finally, we would reduce the thickness of the galvanized iron for all work of that character, from No. 18 to No. 22, as that is as heavy as can be worked by any machine on this coast.

The above are all the suggestions and recommendations we have to make, the advisability of which we will be pleased to discuss with your Honorable Board, Architect and Engineer at any time.

Respectfully submitted,

PERCY & HAMILTON.

FORM OF CONTRACT ADOPTED BY THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ARTICLES OF AGREEMENT made the day of 189 between of in the County of (hereinafter called "the Employer") of the one part and of and of County of Builder* (hereinafter called "the Contractor") of the other part. Whereas the Employer is desirous of† a messuage and premises at and has caused Drawings and a Specification describing the work to be done to be prepared by of , his Architect: And whereas the said Drawings numbered 1 to inclusive and the Specification marked "A" have been signed by or on behalf of the parties hereto: And Whereas the Contractor has agreed to execute upon and subject to the Conditions set forth in the Schedule hereto (hereinafter referred to as "the said Conditions") the works shown upon the said Drawings and described in the said Specification for the sum of £ :

*Insert "s and co-partners" if such is the fact.
†Insert "erecting" or "restoring" or "adding to" as the case may be.

Now it is Hereby Agreed as Follows:—

1. Inconsideration of the sum of £ to be paid at the times and in the manner set forth in the said Conditions, the Contractor will upon and subject to the said Conditions

execute and complete the works shown upon the said Drawings and described in the said Specification.

2. The Employer will pay the Contractor the said sum of £ or such other sum as shall become payable hereunder at the times and in the manner specified in the said Conditions.

3. The term "the Architect" in the said Conditions shall mean the said or, in the event of his death or ceasing to be the Architect for the purpose of this Contract, such other person as shall be nominated for that purpose by the Employer not being a person to whom the Contractor shall object for reasons considered to be sufficient by the Arbitrator mentioned in the said Conditions. Provided always that no person subsequently appointed to be Architect under this Contract shall be entitled to disregard or overrule any decision or approval or direction given or expressed by the Architect for the time being.

4. Any reference in the said Conditions to the Bills of Quantities shall not have the effect of constituting them part of this Contract.

5. The said Conditions shall be read and construed as forming part of this Agreement, and the parties hereto will respectively abide by and submit themselves to the conditions and stipulations and perform the agreements on their parts respectively in such Conditions contained.

As witness our hands this day of 189

Signed in the presence of

SCHEDULE OF CONDITIONS.

DRAWINGS AND SPECIFICATION.

1. The works shall be carried out in accordance with the directions and to the reasonable satisfaction of the Architect in accordance with the said Drawings and Specification, and in accordance with such further drawings, details, and instructions in explanation of the same as may from time to time be given by the Architect. The Contractor Drawings and Specification shall remain in the custody of the Architect, and shall be produced by him at his office as and when required by the Employer or by the Contractor.

COPIES OF DRAWINGS AND SPECIFICATION.

2. One complete copy of all Drawings and of the Specification shall be furnished by the Architect free of cost to the Contractor for his own use. The Architect shall furnish to the Contractor, within days after the receipt by him of a request for the same, any details which in the opinion of the Architect are necessary for the execution of any part of the work, such request to be made only within a reasonable time before it is necessary to execute such work in order to fulfil the Contract. Such copies and details shall be kept on the works until the completion thereof, and the Architect or his representative shall at all reasonable times have access to the same, and they shall be returned to the Architect by the Contractor on the completion of the Contract.

COPY OF ESTIMATE.

3. The Contractor shall on the signing thereof furnish the Architect with a verified * copy of the original estimate for his sole use or that of the Surveyor appointed as in Clause 13 hereof, and for the purposes only of this Agreement.

* The word "sealed" to be inserted if so agreed.

CONTRACTOR TO PROVIDE EVERYTHING NECESSARY.

4. The Contractor shall provide everything necessary for the proper execution of the works, according to the true intent and meaning of the Drawings and Specification taken together, whether the same may or may not be particularly shown on the Drawings or described in the Specification, provided that the same is reasonably to be inferred therefrom; and if the Contractor find any discrepancy in the Drawings, or between the Drawings and Specification, he shall immediately refer the same to the Architect, who shall decide which shall be followed. Figured dimensions are to be followed in preference to the scale.

LOCAL AND OTHER AUTHORITIES; NOTICES, ETC.

5. The Contractor shall conform to the provisions of any Acts of Parliament relating to the works, and to the regulations and by-laws of any Local Authority, and of any Water and Lighting Companies with whose systems the structure is proposed to be connected, and shall, before making and variation from the Drawings or Specification that may be nessitated by so conforming, give to the Architect written notice, specifying the variation proposed to be made, and the reason for making it, and apply for instructions thereon. In case the Contractor shall not in due course receive such instructions he shall proceed with the work, conforming to the provision, regulation, or by-law in question, and any variation so necessitated shall be dealt with under Clause 13. The Contractor shall give all notices required by the said Acts, regulations, or by-laws to be given to any Local Authority, and pay all fees payable to any such Authority, or to any public officer in respect of the works.

SETTING OUT OF WORK.

6. The Contractor shall set out the works, and during the progress of the building shall amend at his own cost any error arising from inaccurate setting out, unless the Architect shall decide to the contrary.

MATERIALS, ETC., TO CONFORM TO SPECIFICATION.

7. All materials and workmanship shall be of the respective kinds described in the Specification, and the Contractor shall upon the request of the Architect furnish him with vouchers to prove that the materials are such as are specified.

FOREMAN.

8. The Contractor shall keep constantly on the works a competent general foreman, and any directions or explanations given by the Architect to such foreman shall be held to have been given to the Contractor.

DISMISSAL OF WORKMEN BY ARCHITECT.

9. The Contractor shall, on the request of the Architect, immediately dismiss from the works any person employed thereon by him who may, in the opinion of the Architect, be incompetent or misconduct himself, and such person shall not be again employed on the works without the permission of the Architect.

ACCESS FOR ARCHITECT TO WORKS

10. The Architect and any person authorized by him shall at all reasonable times have access to the works, and the Architect and his representatives shall at like times have access to the workshops of the Contractor or other places where work is being prepared for the building.

CLERK OF WORKS.

11. The Clerk of Works shall be considered to act solely as inspector and under the Architect, and the Contractor

shall afford him every facility for examining the works and materials.

VARIATIONS AND EXTRAS.

12. The Contractor shall not vary from the Drawings of Specification except as provided by Clause 5, or by the authority of the Architect, which is to be sufficiently proved by any writing or drawing given by him or by any subsequent written approval by him. If the work shown on any of the details or the further drawings or details referred to in Clause 1, or necessary to comply with any instructions, directions, or explanations which may be given from time to time by the Architect, be, in the opinion of the Contractor, in excess of that comprised in the Contract, he shall, before proceeding with such work, give notice in writing to this effect to the Architect. In the event of the Architect and Contractor failing to agree as to whether or not there is any excess, and of the Architect's deciding that the Contractor is to carry out the said work, the Contractor shall accordingly do so, and the question whether or not there is any excess, and if so the amount thereof, shall, failing agreement, be settled by the Arbitrator as provided in Clause 32, and the Contractor shall be paid accordingly. No claim for an extra shall be allowed unless it shall have been executed under the provisions of Clause 5, or by the authority of the Architect as herein mentioned. Any such extra is hereinafter referred to as an authorized extra.

PRICE FOR EXTRAS; HOW ASCERTAINED.

13. No variation shall vitiate the Contract; but all authorized extras for which a price may not have been previously agreed, and any omission which may have been made with the knowledge of the Architect, or without his knowledge, provided he subsequently give a written sanction to such omission, shall be measured and valued, as hereinafter provided, by * ; and a copy of such measurement and valuation shall be given to the Contractor. The fees for so measuring and valuing the variations shall be added to the contract sum. If in the opinion of the Architect the work cannot be properly measured and valued, day work prices shall be allowed therefor, provided that vouchers specifying the time and materials employed shall have been delivered for verification to the Architect, or his nominee, at or before the expiration of the week following that in which such work shall have been done. The variations shall be valued at the rates contained in the Contractor's original estimate, or, where the same may not apply, at rates proportionate to the prices therein contained. The amount to be allowed on either side in respect of the variations so ascertained shall be added to or deducted from the contract sum as the case may be.

* Insert "the Architect," or "a Surveyor appointed by the Architect and approved by the Contractor."

BILLS OF QUANTITIES; EXPENSES OF.

14. The fees for the Bills of Quantities and the Surveyor's expenses (if any) stated therein shall be paid by the Contractor to the Surveyor named therein out of and immediately after receiving the amount of the certificate or certificates in which they shall be included. The fees chargeable under Clause 13 shall be paid by the Contractor before the issue by the Architect of the certificate for the final payment. If the Contractor fails or neglects to pay as herein provided, then the Employer shall be at liberty, and is hereby authorized, to do so on the certificate of the Architect, and the amount so paid by the Employer shall be deducted from the amount otherwise due to the Contractor.

NOTE: In cases where the Surveyor is engaged by the Employer to be paid direct by him this clause will come out.

UNFIXED MATERIALS WHEN TAKEN INTO ACCOUNT TO BE PROPERTY OF EMPLOYER.

15. When the Contractor shall have received payment of any certificate in which the Architect shall have stated that he has taken into account the value of any unfixed materials intended for the works, and placed by the Contractor thereon, or upon ground adjacent thereto, all such materials shall become the property of the Employer, and shall not be taken away, except for the purpose of being used on the building, without the written authority of the Architect; and the Contractor shall be liable for any loss of or damage to such materials.

POWER OF ARCHITECT TO ORDER REMOVAL OF IMPROPER WORK.

16. The Architect shall, during the progress of the works, have power to order in writting from time to time the removal from the works, within such reasonable time or times as may be specified in the order, of any materials which in the opinion of the Architect are not in accordance with the Specification or the instructions of the Architect, the substitution of proper materials, and the removal and proper re-execution of any work executed with materials or workmanship not in accordance with the Drawings and Specification or instructions; and the Contractor shall forthwith carry out such order at his own cost. In case of default on the part of the Contractor to carry out such order, the Employer shall have power to employ and pay other persons to carry out the same; and all expenses consequent thereon or incidental thereto shall be borne by the Contractor, and shall be recoverable from him by the Employer, or may be deducted by him from any moneys due or that may become due to him.

DEFECTS AFTER COMPLETION.

17. Any defects, shrinkage, or other faults which may appear within months from the completion of the works, arising in the opinion of the Architect from materials or workmanship not in accordance with the Drawings and Specification or the instructions of the Architect, or any damage to pointing by frost appearing within the like period, shall upon the directions in writing of the Architect, and within such reasonable time as shall be specified therein, be amended and made good by the Contractor at his own cost, unless the Architect shall decide that he ought to be paid for the same; and in case of default the Employer may employ and pay other persons to amend and make good such defects, shrinkage, or other faults or damage, and all expenses consequent thereon or incidental thereto shall be borne by the Contractor and shall be recoverable from him by the Employer, or may be deducted by him from any moneys due or that may become due to the Contractor. Should any defective work have been done or material supplied by any sub-contractor or other person employed on the works who has been nominated or approved by the Architect, the Contractor shall be liable to make good in the same manner as if such work or material had been done or supplied by the Contractor, and been subject to the provisions of this and the preceding clause.

WORK TO BE OPENED UP AT REQUEST OF ARCHITECT.

18. The Contractor shall, at the request of the Architect, within such time as the Architect shall name, open for in-

spection any work covered up; and should the Contractor refuse or neglect to comply with such request, the Architect may employ other workmen to open up the same. If the said work has been covered up in contravention of the Architect's instructions, or if on being opened up it be found not in accordance with the Drawings and Specification or the instructions of the Architect, the expenses of opening and covering it up again, whether done by the Contractor or such other workman, shall be borne by, and recoverable from, the Contractor, or may be deducted as aforesaid. If the work has not been covered up in contravention of such instructions, and be found in accordance with the said Drawings and Specification or instructions, then the expenses aforesaid shall be borne by the Employer and be added to the Contract sum: provided always that in the case of foundations, or of any other urgent work so opened up and requiring immediate attention, the Architect shall, within a reasonable time after receipt of notice from the Contractor that the work has been so opened, make or cause the inspection thereof to be made, and at the expiration of such time, if such inspection shall not have been made, the Contractor may cover up the same, and shall not be required to open it up again for inspection expect at the expense of the Employer.

ASSIGNMENT OR SUB-LETTING.

19. The Contractor shall not, without the written consent of the Architect, assign this Agreement or sublet any portion of the works.

SUB-CONTRACTORS.

20. No sub-contractor or other person nominated by the Architect shall be employed upon the works against whom the Contractor shall make what the Architect considers reasonable objection, or who will not enter into a contract with the Contractor guaranteeing the due performance of his work, and indemnifying the Contractor against any claims arising out of misuse by the sub-contractor or his workmen of any scaffold erected or plant employed by the Contractor, or that may be made against the Contractor in consequence of any act, ommission, or default of the sub-contractor, his servants or agents.

DAMAGE TO PERSON AND PROPERTY.

21. The Contractor shall be responsible for all structural and decorative damage to property, and for injury caused by the works or workmen to persons, animals, or things, and shall hold the Employer harmless in respect thereof. He shall also be responsible for all injuries caused to the buildings, the subject of this Contract, by frost, or other inclemency of weather, and shall reinstate all damage caused by the same, and thoroughly complete the whole of the works.

INSURANCE—(A) OF A NEW BUILDING.

22. (*a*) The Contractor shall insure the works, and keep them insured until they are delivered up, against loss or damage by fire, in an office to be approved by the Architect, in the joint names of the Employer and Contractor, for the full value of the works executed, and shall deposit with the Architect the policies and receipts for the premiums paid for such insurance; and in default the Employer may insure the works and deduct the premium paid from any moneys due or which may become due. All moneys received under any such policies are to be paid to the Contractor by instalments on the certificates of the Architect, and to be applied in or towards the rebuilding or reparation of the works destroyed or injured. The Contractor shall, as soon as the claim under the policy is settled, proceed with all due diligence with the rebuilding or reparation, and shall not be entitled to any payment in respect thereof other than the said moneys received, but such extension of the time herein mentioned for completion shall be made as shall be just and reasonable. (*b*) The whole building and the works executed under this Contract shall be at the sole risk of the Employer as regards any loss or damage by fire, and in the event of any such loss or damage being so occasioned which affects the original building or structure in addition to the new work, the Contractor shall be entitled to receive from the Employer the full value of all work then executed and materials then delivered, calculated in the manner provided for by Clause 13 hereof, and this Contract, so far as it relates to any subsequent work, may at the option of either party be determined if in the opinion of the Arbitrator such determination shall be just and equitable.

NOTE: Clause [*a*] or [*b*] to be struck out to suit circumstances. [*b*] of a building in course of alteration.

DATE OF COMPLETION.

23. Possession of the site (or premises) shall be given to the Contractor on or before the day of . He shall begin the works immediately after such possession, shall regularly proceed with them, and shall complete the same (except painting and papering or other decorative work which in the opinion of the Architect it may be desirable to delay) by the day of , subject nevertheless to the provisions for extension of time hereinafter contained.

PENALTIES FOR NON-COMPLETION.

24. If the Contractor fail to complete the works by the date named in Clause 23, or within any extended time allowed by the Architect under these presents, and the Architect shall certify in writing that the works could reasonably have been completed by the said date, or within the said extended time, the Contractor shall pay or allow to the Employer the sum of £ sterling per* as liquidated and ascertained damages for every* beyond the said date or extended time, as the case may be, during which the works shall remain unfinished, except as provided by Clause 23, and such damages may be deducted by the Employer from any moneys due to the Contractor.

* Insert "day" or "week" as may be agreed.

EXTENSION OF TIME.

25. If in the opinion of the Architect the works be delayed by *force majeure* or by reason of any exceptionally inclement weather, or by reason of instructions from the Architect in consequence of proceedings taken or threatened by or disputes with adjoining or neighboring owners, or by the works or delay of other Contractors or tradesmen engaged or nominated by the Employer or the Architect, and not referred to in the Specification, or by reason of authorized extras or additions, or in consequence of any notice reasonably given by the Contractor in pursuance of Clause 12, or by reason of any local combination of workmen or strikes or lock-out affecting any of the Building trades, or in consequence of the Contractor not having received in due time necessary instructions from the Architect for which he shall have specifically applied in writing, the Architect shall make a fair and reasonable extension of time for completion in respect thereof. In case of such strike or lock-out the Contractor shall, as soon as may be, give to the Architect written notice thereof. But the Contractor shall nevertheless use his best endeavors to prevent delay, and shall do all

INSTITUTE OF BRITISH ARCHITECTS * ROYAL * MDCCCXXXIV

that may reasonably be required to the satisfaction of the Architect to proceed with the works.

SUSPENSION OF WORKS BY CONTRACTOR.

26. If the Contractor, except on account of any legal restraint upon the Employer preventing the continuance of the works, or on account of any of the causes mentioned in Clause 25, or in case of a certificate being withheld or not paid when due, shall suspend the works, or in the opinion of the Architect shall neglect or fail to proceed with due diligence in the performance of his part of the Contract or if he shall more than once make default in the respects mentioned in Clause 16, the Employer by the Architect shall have power to give notice in writing to the Contractor requiring that the works be proceeded with in a reasonable manner and with reasonable dispatch. Such notice shall not be unreasonably or vexatiously given, and must signify that it purports to be a notice under the provisions of this clause, and must specify the act or default on the part of the Contractor upon which it is based. After such notice shall have been given, the Contractor shall not be at liberty to remove from the site or works, or from any ground contiguous thereto, any plant or materials belonging to him which shall have been placed thereon for the purposes of the works; and the Employer shall have a lien upon all such plant and materials, to subsist from the date of such notice being given until the notice shall have been complied with. Provided always that such lien shall not under any circumstances subsist after the expiration of thirty-one days from the date of such notice being given unless the Employer shall have entered upon and taken possession of the works and site as hereinafter provided. If the Contractor shall fail for days after such notice has been given to proceed with the works as therein prescribed, the Employer may enter upon and take possession of the works and site, and of all such plant and materials thereon (or on any ground contiguous thereto) intended to be used for the works, and all such materials as above mentioned shall thereupon become the property of the Employer absolutely, and the Employer shall retain and hold a lien upon all such plant until the works shall have been completed under the powers hereinafter conferred upon him. If the Employer shall exercise the above power he may engage any other person to complete the works, and exclude the Contractor, his agents and servants, from entry upon or access to the same, except that the Contractor or any one person nominated by him may have access at all reasonable times to inspect, survey, and measure the works. And the Employer shall take such steps as in the opinion of the Architect may be reasonably necessary for completing the works without undue delay or expense, using for that purpose the plant and materials above mentioned in so far as they are suitable and adapted to such use. Upon the completion of the works the Architect shall certify the amount of the expenses properly incurred consequent on and incidental to the default of the Contractor as aforesaid, and in completing the works by other persons. Should the amount so certified as the expenses properly incurred be less than the amount which would have been due to the Contractor upon the completion of the works by him, the difference shall be paid to the Contractor by the Employer; should the amount of the former exceed the latter, the difference shall be paid by the Contractor to the Employer. The Employer shall not be liable to make any further payment or compensation to the Contractor for or on account of the proper use of the plant for the completion of the works under the provisions hereinbefore contained other than such payment as is included in the contract price. After the works shall have been so completed by persons other than the Contractor under the provisions hereinbefore contained, the Employer shall give notice to the Contractor of such completion and may require him from time to time, before and after such completion, to remove his plant and all such materials as aforesaid as may not have been used in the completion of the works from the site. If such plant and materials are not removed within a reasonable time after notice shall have been given, the Employer may remove and sell the same, holding the proceeds, less the cost of the removal and sale, to the credit of the Contractor. Any notice to be given to the Contractor under this clause shall be given by leaving the same at the place of business of the Contractor, or by registered letter sent to him at that address.

"PRIME COST," MEANING OF.

27. The words "Prime Cost" or the initials P. C. applied in the Specification to goods to be obtained and fixed by the Contractor, shall mean, unless otherwise stated in the Specification, the sum paid to the merchant after deducting all trade discount for such goods in the ordinary course of delivery, but not deducting discount for cash, and such sum shall be exclusive of special carriage, the cost of fixing, and Contractor's profit.

PROVISIONAL SUMS.

28. The provisional sums mentioned in the Specification for materials to be supplied or for work to be performed by special artists or tradesmen, or for other works or fittings to the building, shall be paid and expended at such times and in such amounts and to and in favor of such persons as the Architect shall direct, and sums so expended shall be payable by the Contractor without discount or deduction, or (without prejudice to any rights of the contractor existing under the contract referred to in Clause No. 20) by the Employer to the said artists or tradesmen. The value of works which are executed by the contractor in respect of provisional sums, or in additional works, shall be ascertained as provided by Clause 13. At the settlement of the accounts the amount paid by the contractor to the said artists or tradesmen, and the said value of such works executed by the contractor, shall be set against all such provisional sums or any sum provided for additional works, and the balance shall be added to or deducted from the contract sum.

CONTRACTOR TO ERECT SCAFFOLDING FOR SUB-CONTRACTORS.

29. The contractor shall, unless otherwise stated in the Specification, provide and erect all necessary scaffolding and plant for the due execution by the artists and tradesmen referred to in the preceding clause of the work entrusted to them. He shall also permit of the execution of work by any other artists or tradesmen who may be engaged by the Employer.

PAYMENT AND CERTIFICATES.

30. The contractor shall be entitled under the certificates to be issued by the architect to the contractor, and within days of the date of each certificate, to payment by the employer from time to time by installments, when in the opinion of the architect work to the value of £ * (or less at the reasonable discretion of the architect) has been executed in accordance with the contract, at the rate of per cent of the value of work so executed in the building.

until the balance retained in hand amounts to £ (x), after which time the installments shall be up to the full value of the work subsequently executed. The contractor shall be entitled, under the certificate to be issued by the architect, to receive £ (y), part of the said sum of £ (x), when the works are practically completed, and in like manner to payment of the balance within a further period of months, or as soon after the expiration of such period of months as the works shall have been finally completed, and all defects made good according to the true intent and meaning thereof, whichever shall last happen. The architect shall issue his certificates in accordance with this clause. No certificate of the architect shall be considered conclusive evidence as to the sufficiency of any work or materials to which it relates, nor shall it relieve the contractor from his liability to make good all defects as provided by this agreement. The contractor when applying for a certificate shall, if required, as far as practicable, furnish to the architect an approximate statement of the work executed, based on the original estimate.

NON-PAYMENT BY EMPLOYER.

31. Should the employer not pay the contractor any sum certified by the architect within the times respectively named in Clause 30, the contractor shall give written notice to the employer of the non-payment, and should the employer not pay any such sum within the period of days from the date of delivery of such notice at the employer's address or sent to him there in the ordinary course of post by registered letter, or if the employer shall become bankrupt or file any petition for liquidation of his affairs, and if his Trustee in Bankruptcy shall repudiate this contract, or if the Trustee shall be unable to show within days to the reasonable satisfaction of the contractor his ability to carry out the contract, and to make all payments due or to become due thereunder, or if the works be stopped for months under an order of the architect or any court of law, the contractor shall be at liberty to determine the contract by notice in writing to the architect, and to recover from the employer payment for all work executed and for any loss he may sustain upon any plant or material supplied or purchased or prepared for the purpose of the contract. In arriving at the amount of such payment the rates contained in the contractor's original estimate shall be followed, or, where the same may not apply, rates proportionate to the prices therein contained.

ARBITRATION.

32. Provided always that in case any dispute or difference shall arise between the employer or the architect on his behalf and the contractor, either during the progress of the works or after the determination, abandonment, or breach of the contract, as to the construction of the contract or as to any matter or thing arising thereunder (except as to the matters left to the sole discretion of the architect under Clauses 4, 9 and 19, and the exercise by him under Clause 18 of the right to have any work opened up), or as to the withholding by the architect of any certificate to which the contractors may claim to be entitled, then either party shall forthwith give to the other notice of such dispute or difference, and such dispute or difference shall be and is hereby referred to the arbitration and final decision of

or in the event of his death or unwillingness or inability to act, of , or, in the event of his death or unwillingness or inability to act, of a person to be appointed on the request of either party by the President for the time being of The Royal Institute of British Architects, and the award of such Arbitrator shall be final and binding on the parties. Such reference, except on the question of certificate, shall not be opened until after the completion or alleged completion of the works, unless with the written consent of the employer or architect and the contractor. The Arbitrator shall have power to open up, review, and revise any certificate, opinion, decision, requisition, or notice, save in regard to the said matters expressly excepted above, and to determine all matters in dispute which shall be submitted to him, and of which notice shall have been given as aforesaid, in the same manner as if no such certificate, opinion, decision, requisition, or notice had been given. Upon every or any such reference the costs of and incidental to the reference and award respectively shall be in the discretion of the Arbitrator, who may determine the amount thereof, or direct the same to be taxed as between solicitor and client or as between party and party, and shall direct by whom and to whom and in what manner the same shall be borne and paid. This submission shall be deemed to be a submission to arbitration within the meaning of the Arbitration Act 1889.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

PROPOSED CITY HALL, Oakland, Cal., W. J. Cuthbertson, Architect.

DESIGN FOR RESIDENCE, John J. & T. D. Newsom, Architects.

CHATEAU DE VITRE by Francis W. Wilson.

REID BROS. should have been credited with the design of the building being erected by Claus Spreckels on Market street for the *Morning Call* published in last month's Journal.

SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE Annual Meeting of the San Francisco Chapter of the American Institute of Architects was held on Friday, Sepremper 13, 1895.

The election of officers for the ensuing term resulted in the selection of the following:—Seth Babson, President; W. P. Moore, Vice-President; Oliver Everett, Secretary; John M. Curtis, Treasurer. Trustees—Geo. H. Sanders, W. J. Mathews, F. T. Shea, H. A. Schulze, M. J. Lyon.

BOOKS AND PERIODICALS.

THE ENGINEERING REVIEW, epitome of current engineering literature, published in London for August, 1895, contains as leading article the description of the principal steamship lines, with illustrations. The remarkable advances that have been made in naval architecture and marine engineering during recent years invests this subject with a special interest.

THE FORTNIGHTLY REVIEW for August has a very explicit account of politics in the Transvaal, proving pretty conclusively that the present Boer Reign cannot last much longer with the large influx of Americans, English and Africanders thereinto. Also an article on "Common Sense and Crime," a critique on the Report of the Parliamentary Committee formed for examining into Prison Administration. The whole result seems to be contained in the following sentence—"Honesty is but poorly paid, the wages of weekly toil are but trifling in comparison with the profits of a single *coup* which will enable its perpetrator to lead an easy, idle life for months." From which it appears that the common sense way of diminishing crime is to make the wages of honest labor sufficient for its recipients to lead a well-to-do, easy life and to provide the opportunity for all to obtain the same.

Fitting tributes are made to Prof. Huxley—in one of which he is set right with the Altruistic world by showing that the survival of the "fittest" did not necessarily mean the "best," in the following passage quoted from the works:

"As I have already urged, the practice of that which is ethically best—what we call goodness or virtue—involves a course of conduct which, in all respects, is opposed to that which leads to success in the cosmic struggle for existence. In place of ruthless self-assertion it demands self-restraint; in place of thrusting aside, or treading down, all competitors, it requires that the individual shall not merely respect, but shall help his fellows; its influence is directed, not so much to the survival of the fittest, as to the fitting of as many as possible to survive. It repudiates the gladiatorial theory of existence. It demands that each man who enters into the enjoyment of the advantages of a polity shall be mindful of his debt to those who have laboriously constructed it; and shall take heed that no act of his weakens the fabric in which he has been permitted to live. Laws and moral precepts are directed to the end of curbing the cosmic process and reminding the individual of his duty to the community, to the protection and influence of which he owes, if not existence itself, at least the life of something better than a brutal savage."

LIPPINCOTT'S MAGAZINE for September comes to hand with its usual complete novel "A Case in Equity," by Francis Lynde, it is of interest as the reader is lead to expect a case in a law court while after all the equity is a case in the court of love, but as every thing comes out all right in the end, every body is supposed to be happy. "Napoleon and the Regent Diamond" is rather a disappointing detail of dry facts, where the reader may have been expecting a story as sparkling as the name implies. In general the contents are interesting and will repay a careful perusal.

J. CATHER NEWSOM, ARCHITECT.

"WHERE IGNORANCE IS BLISS, T'IS FOLLY TO BE WISE."

HOW many people appear to be happy living under the delusion that the above line from Thomas Gray is a fact. We were led into this reflection by over-hearing a contractor who was building a house upon the opposite side of the avenue in which we live. "Why!" he exclaimed, "your cottage has a foundation fit for a three story house, there is no need of such bracing for a one story cottage, it costs money, and the owner never knows the difference."

Many people appear to think the money paid to an architect for planning and supervising a building, is so much money added to the cost, not reflecting that every dollar paid the architect, may result in saving two dollars to the owner.

It may be true that a poor foundation and scant bracing may pass muster for a time and if the walls are prettily tinted and a lovely picture moulding around the rooms, the owner is satisfied for the time, then if another house is built on each side the three may protect each other from blowing down.

This is no fancy sketch as may be seen in more than one instance in Richmond where a house has been wedged in between two other houses for the purpose of support.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

RELEASE AND DISCHARGE—JOINT CONTRACTORS.—Where a person who is liable to two or more on a joint contract settles with one of them for a part of the claim, such settlement does not discharge him from the liability to the others, but they may sue for their part without joining the one settled with.

Lansing v. Bliss, Supreme Court, General Term, First Department, 33 N. Y. Sup. Rep. 310.

EFFECT OF PAYMENT OF AMOUNT OF LIEN INTO COURT.—The character of an action to foreclose a mechanic's lien is not affected by the fact that the amount claimed has been deposited with the clerk of the court, and the claimant is not entitled to the money deposited until he has recovered a judgment of foreclosure against the property.

Schillinger Fire-proof Cement & Asphalt Co. v. Arnott, Supreme Court, General Term, First Department, 33 N. Y. Sup. Rep. 343.

SERVICE OF NOTICE OF MECHANICS' LIEN ON OWNER.—Under the statute, providing that a notice of the lien filed shall within ten days be served on the owner or lessee if he can be found in the county, or in case of his absence from the county, then a copy on his agent within the county, and, if neither can be found within the county, a copy of such notice shall be posted on the building, service of notice by mailing a copy to the general manager of the owner at a place outside the county is insufficient.

Hannah & Lay Mercantile Co. v. Mosser, Supreme Court of Michigan, 62 N. W. Rep. 1120.

DAMAGES FOR DELAY.—Where a contractor fails to complete a building, and the owners take possession and do so, the measure of damages will be the amount of the unpaid contract price, less the fair and reasonable amount the owners had to pay to complete the work.

Mills v. Paul, Court of Civil Appeals of Texas, 30 S. W. Rep. 558.

THE SUPREME COURT OF PENNSYLVANIA HOLDS, THAT THE OWNER OF A BUILDING CANNOT COMPLAIN OF AN INSTRUCTION.—In an action to enforce a mechanics' lien restricting a material man's recovery to the value of the materials furnished by him on the credit of the buildings, and actually used in their construction.

Scranton Lathe Turning Co. v. Cassidy, 31 At. Rep. 734.

VALIDITY OF ORDER CANCELLING LIEN.—Under the statutes, providing that at the commencement of an action to forclose, the lien may be discharged by the deposit of "such sum of money as in the judgment of the court will be sufficient to pay any judgment which may be recovered against the property," the only question for the court, on an application to cancel the lien, is the amount of the deposit to be made, and the validity of a claim cannot then be inquired into, and therefore an order directing the cancellation of a lien without requiring a deposit to secure it is void, though the claimant was made a defendant to the action, and failed to appear.

Fisher v. Hussey, Supreme Court of New York City, General Term, 32 N. Y. Sup. Rep. 762.

PAYMENT CANNOT BE ENFORCED UNTIL CONTRACT IS COMPLETE.—Under the statute, providing that, before a party can compel another to perform any act under it, he must fulfill all conditions precedent imposed upon himself, one who has agreed with a contractor to furnish "all the couplings to be used in the construction of a pipe line," at a fixed rate per pound, cannot enforce payment before all the material has been delivered; and hence his cause of action against the owner of the structure does not accure till the last delivery.

First Nat. Bank of Bridgeport v. Perris Irrigation Dist. 40 Pac. Rep. 45.

ENTIRETY OF CONTRACT.—Under a contract providing for the erection of a house, and that the owner, on the erection of the same, should pay the contractors the sum of $2,218 as follows: First shall be deducted therefrom (the final payment) all liquidating damages and deductions by reason of improper labor and material, and the balance payable as follows: $200 when foundation is completed, $600 when roof is on, $700 when plastering is completed and acceptance of house, provide dno sum shall be due till all work and material is done and furnished in compliance with plans and specifications to the owner's satisfaction, and mechanics' lien released—is not an entire contract, preventing action upon it before completion of the building according to the contract.

Crawford v. McKinney, Supreme Court of Penn., 30 At. Rep. 1047.

DEFECTIVE CLAIM FOR MECAANICS' LIEN.—A mechanics' lien claim, which states that the material was furnished to one person, and that the land was owned by another, and does not state that the material was furnished at the request of the owner, is fatally defective, though it alleges that the person to whom the material was furnished was in possession of the land under a contract of purchase with the owner.

Cross v. Tscharnig, Supreme Court of Oregon, 39 Pac. Rep. 540.

FATAL VARIANCE IN MECHANICS' LIEN CLAIM.—Where the claim of mechanics' lien, and the complaint in an action to foreclose the lien, alleged a contract to pay the carpenter $3.50 per day, and a contract to pay the reasonable value of his services was proved, and such value was shown to be $2.84 per day, the variance is fatal.

Jones v. Shuey, Supreme Court of California, 40 Pac. Rep. 17.

THE J. L. MOTT IRON WORK'S SHOW ROOM.

THE J. L. MOTT IRON WORKS of New York have opened an exhibition of goods manufactured by them, at Room 27 Flood Building under the management of M. S. James who, for several years has been well and favorably known on the Pacific Coast as their Representative. They have fitted up two large rooms completely filled with the different articles that are needed by Architects, Plumbers and Builders. Along one wall is a row of closets under water showing all the latest improvements in Mechanism, and the practical working of same can be seen.

There are all the usual kinds of Bath and Seat Tubs shown in Porcelain Iron and Imperial Solid Porcelain; Laundry Tubs, Kitchen and Slop Sinks, etc. Some of them are beautifully decorated in gold and some are plain. One of the most attractive objects of the whole display is a Lavatory of Mexican Rose Onyx, with China Basin and Mirror over same and Silver plated Trimmings. Another Lavatory shown is of Italian Statuary Marble with China Basin, Mirror and Nickel plated Trimmings. The great reduction in the prices of the Imperial Solid Porcelain goods recently made by this Firm brings them in reach of almost everyone that would use the Porcelain lined goods, there being only a slight difference in the cost.

There is a display also of Shower and Needle Baths for use principally in private residences and public Baths. These are shown fitted with Porcelain lined Iron Receptors instead of the old style Marble Slab. These Receptors prevent the water from flowing all over the floor of Bath Room and are a great improvement. There is also to be seen a full line of Plumber's specialties, including Bath Room Trimmings, such as Towel Racks and Shelves, Sponge and Comb and Brush Holders, etc., that are manufactured by them and which have obtained for themselves such a high reputation.

The J. L. Mott Iron Works has been induced by Mr. James to open these Show Rooms because of the unsatisfactory methods both to him and his customers of selling from Catalogue. The goods can now be shown the parties who desire to use them and can see exactly what they are going to have. The business of the Mott Iron Works has increased to such an extent, and with the constantly getting out by them of new goods it became almost an absolute necessity that some such Headquarters should be opened.

The J. L. Mott Iron Works, through Mr. James their Coast Manager extends a very cordial invitation to Architects, Plumbers, Contractors and all persons contemplating building, who may be interested in fine plumbing work to visit these rooms in the Flood Building feeling satisfied that they will be well repaid.

CITY BUILDING NEWS.

Alabama near 22d. To build; owner, John C. Callaghan; architect, M. J. Welsh; contractor, Jos. Sullivan; signed, Aug. 8; filed, Aug. 10; cost $2,605.

Bartlett near 21st. Alterations; owner, Mrs. A. C. Kratz; contractor, H. R. Schuckert; signed, Aug. 9; filed, Aug. 10; cost $1189.

Bartlett near 22d. Alterations and additions; owner, Mrs. Agatha Curiaz; architect, Emil John; contractors, Welavehi & Fromz; signed, Aug. 12; filed, Aug. 14; cost $3525.

Bernard near Jones. To build; owner, Abraham Hessel; contractor, F. V. Acker; signed, Aug. 20; filed, Aug. 20; cost $2550.

Brannan near 4th. To build; owner, Rev. D. Nugent; architect, P. J. Donohoe; contractor, Daniel Powers; signed, Aug. 8; filed, Aug. 10; cost $7599.

Brannan near 2d. Alterations and repairs; owner, Vermont Marble Co.; contractor, J. A. McDonald; cost $5000.

Brannan near 4th. To build; owner, John Donovan; architect, E. A. Garin; contractor, J. A. McDonald; signed, Aug. 14; filed, Aug. 22; cost $2825.

Brannan near 4th. To build; owner, D. Lewis; cost $2900.

Broderick near Golden Gate Ave. To build; owner, A. Goodman; architect, C. M. Rousseau; contractor, J. Irwin; cost $5000.

Broadway near Webster. To build; owner, W. H. Dimond, architects, Polk & Polk; contractors, W. Knowles & Co.; signed, Aug. 6; filed, Aug. 16; cost $14,960.

Broadway and Buchanan. Plumbing, etc.; owner, Annie Donahue; architect, A. Page Brown; contractor, W. H. Wilson; signed, Aug. 9; filed, Aug. 23; cost $4480.

Broadway and Buchanan. Steam heating; owner, Annie Donahue; architect, A. Page Brown; contractor, W. W. Montague & Co.; signed, Aug. 23; filed, Aug. 23; cost $1525.

Broadway and Buchanan. Mill work; owner, Annie Donahue; architect, A. Page Brown; contractors, Burnham-Sandeford Co.; signed, Aug. 7; filed, Aug. 23; cost $4850.

Broadway near Gough. Plumbing, etc.; owner, Mrs. Maggie Hochstadter; architect, M. J. Lyon; contractor, H. Williamson; signed, Aug. 15; filed, Aug. 29; cost $788.

Broadway and Buchanan. Painting, etc.; owner, Annie Donahue; architect, A. Page Brown; contractor, J. H. Keefe; signed, Aug. 31; filed, Sept. 5; cost $1735.

Bluxome near 4th. To build; owner, Elizabeth O'Brien; architect, P. J. Donahue; contractor, C. B. Franklin; signed, Aug. 20; filed, Aug. 21; cost $2400.

Bush near Laguna. Alterations and additions; owner, M. J. Simmons; Alexander; Hildebrand, superintendent; contractors, J. A. and Allan McDonald; signed, Aug. 20; filed, Aug. 21; cost $2845.

Bush near Laguna. Painting, etc.; owner, Congregation Ohabai Shalome; architect, M. J. Lyon; contractor, A. A. Ehat; signed, Aug. 17; filed, Aug. 20; $964.

Buchanan near Sutter. Alterations and additions; owner, Mary Doran; contractor, Herman Hansel; signed, Sept. 2; filed, Sept. 2; cost $1840.

California and Devisadero. To build; owner, Mary G. Dutton; architects, Percy & Hamilton; contractors, Concannon & Shay; signed, Aug. 14; filed, Aug. 15; cost $7500.

California and Devisadero. Excavations; owner, Mary G. Dutton; architects, Percy & Hamilton; contractors, Riley & Laine; signed, Aug. 14; filed, Aug. 15; cost $2175.

California near Scott. To build; owner and builder, J. F. Ortman; architect, M. R. Johns; cost $12,000.

California near Broderick. To build; owner, Wm. F. Roberts; architect, Emil John; contractor, W. H. Wilton; signed, Aug. 21; filed, Aug. 24; cost $3140.

California near Broderick. Alterations and additions; owner, Mrs. Annie A. Kelly; architect, Emil John; contractors, Lorenzen & Fevrie; signed, Sept. 4; filed, Sept. 7; cost $2286.

California near Mason. To build; owner, Elizabeth Jane Tricot; architect, Emile Depierre; contractor, D. Ross; signed, Sept. 4; filed, Sept. 5; cost $8800.

Central Ave. near Pacific Ave. To build; owner, Mr. and Mrs. C. E. Brown; contractor, P. Rive; signed, Aug. 15; filed, Aug. 16; cost $5300.

Clement near 13th Ave. To build; owner, Andrew Lynch; architect, C. F. Robertson; contractor, C. Larsen; signed, Aug. 26; filed, Aug. 27; cost $925.

Clay near Drumm. One-story brick; owner, John Van Bergen; architect, Henry Geilfuss; contractors, Hood & Watson; signed, Aug. 2; filed, Sep. 2; cost $1439.

Commercial near Sansome. Repair on brick; owner, Agent L. C. Babin; contractor, W. B. Kroeger; cost $8600.

Dupont and Bay. Mason work for brick warehouse; owners, Stauffer & Co.; contractor, J. H. Hanavan; cost $1360.

Drumm and Commercial. Two-story brick; owners, Deming & Co.; cost $7000.

Drumm and Merchant. Two-story brick; owner, J. De La Montanya; architects, Percy & Hamilton; contractor, Silas Carle; signed, Aug. 24; filed, Aug. 27; cost $23,743.

Ellis near Taylor. Additions; owner, by Agent G. O. Davis; raising, etc.; cost $10,000.

Ellis near Laguna. Additions and alterations; owner, Anton Hollar; architect, Martens & Coffey; contractors, Ackerson & Peterson; signed, Aug. 31; filed, Aug. 31; cost $5945.

Eleventh near Bryant. To build; owners, J. T. and O. J. Redmond; architect, J. P. Brady; contractors, Barrett & Quinn; signed, Aug. 26; filed, Aug. 30; cost $2950.

Fair Oaks near 25th. To build except mantels, etc.; owner, Clara L. Arguello; architect, Martens & Coffey; contractors, Ackerson & Paterson; signed, Aug. 22; filed, Aug. 22; cost $3600.

Fourth near Brannan. To build; owner, Isabella H. Lacy; architect, S. Babson; contractor, M. S. Libbey; signed, Aug. 22; filed, Aug. 22; cost $2850.

Fourth Ave. near Lake. To build; owner, W. O'Leary; contractor, Jas. McConahey; signed, Aug. 12; filed, Aug. 12; cost $1582.

Fourth Ave. near Pt. Lobos. To build; owner, Mrs. Marie J. Ganco; contractor, J. V. Hull; signed, Aug. 13; filed, Aug. 13; cost $3400.

Fourth and Branhan. To build; owner, Estate of Wm. Schmidt, per W. G. Horshaw; architect, W. J. Mathews; contractor, P. Maloney; signed, Aug. 23; filed, Aug. 29; cost $4925.

Fourth and Brannan. To build; superintendent, Geo. Lack; days' work; cost $2500.

Fifth near Brannan. To build; owner, J. Hummell; contractor, H. Mitzler; cost $1800.

Folsom Wharf Coal bunkers; owners, Dunsmuir & Sons; contractor, Pacific Bridge Co.; cost $10,387.

Folsom street wharf No. 2. Coal bunkers; owner, R. Dunsmuir & Sons; architect, H. C. Holmes; contractors, Pacific Bridge Co.; signed, Sept. 6; filed, Sept. 11; cost $10,724.

Fillmore and Washington. To build; owner, Emma Joseph; architect, W. H. Lillie; contractors, Moore & Camerary; signed, Aug. 22; filed, Aug; 29; cost $5896.

Freelon near 4th. Three two-story frames; owner, Mrs. J. Stappenbeck; architect, Emil John; contractor, H. T. Grelb; signed, Aug. 9; filed, Aug. 14; cost $4525.

Freelon near Fourth. To build; owner, Patrick Minehan; architect, A. J. Barnett; contractors, Sheilds & Hickox; signed, Aug. 20; filed, Aug. 22; cost $1410.

Freelon near 4th. To build; owner, Wm. Gleuson; architect, A. J. Barnett; contractors, Sheild & Hickox; signed, Aug. 20; filed, Aug. 22; cost $3200.

Fifteenth near Brannan. Stable; owner, Mrs. Zoe F. Venard; contractor, R. J. Pavert; signed, Aug. 12; filed, Aug. 13; cost $1081.

Fifteenth Ave; near P. To build; owner, Casper J. Becker; architect, D. J. Ellis; contractor, J. P. Rines; signed, Aug. 12; filed, Aug. 13; cost $1200.

Fourteenth near Howard. To build; owner, Leon Levy; architect, E. J. Vogel; contractors, White Bros.; signed, Aug. 19; filed, Aug. 19; cost $4225.

Francisco and Stockton. Concrete and artificial stone work; owner, S. F. Fire Department; architect, C. R. Wilson; contractor, W. H. Wickersham; subcontractor, Keatinge, Leonard & Ransome; signed, Aug. 8; filed, Aug. 22; cost $4150.

Forty-eighth Ave. and V. To build; owner, C. Musorro; architects, Havens & Toepke; contractor, Geo. Walker; signed, Sept. 10; filed, Sept. 11; cost $3525.

Green near Fillmore. To build; owner, Alexander Heins; architects, Kenitzer & Barth; contractor, Chas. Schutt; signed, Aug. 14; filed, Aug. 16; cost $4480.

Green and Octavia. To build; owner, Edward Delcani; architect, E. Depierre; contractors, A. Caccia & Co.; signed, Aug. 22; filed, Aug. 24; cost $6470.

Grove near Buchanan. To build; owner, Jacob Denzler; architects, Kenitzer & Barth; contractor, Adam Miller; signed, Sept. 4; filed, Sept. 5; cost $7100.

Haight and Waller. Clayton and Cole, recreation ground; owners, Paul Boyton Chute Co; architect, Robert J. Riley; contractors, Pacific Bridge Co.; signed, Sept. 5; filed, Sept. 6; cost $3015.50.

Harrison near Third. owner, Mary J. Morrison; contractors, Johnson & Secor; signed, Sept. 3; filed, Sept. 3; cost $2300.

Howard near Lafayette. To build; owner, Margaret McCormick; architect, J. P. Brady; contractor, John Foster; signed, Aug. 23; filed, Aug. 23; cost $3375.

Hyde near Geary. To build; owner, M. Keefe; architect, M. J. Welsh; contractor-Doyle & Son; signed, Sept. 6; filed, Sept. 11; cost $6784; plumbing, etc., contractor, E. Hogan, $840; electrical work, contractor, Will & Fink, $165; painting, M. J. Donovan, $635.

Jackson near Central Ave. To build; owner, Minnie H. Hollows; architect, Emil John; contractor, F. A. Hellmuth; signed, Aug. 30; filed, Sept. 4; cost $2886.

Jersey near Noe. To build; owner, Wm. Morgan; contractors, Bell & Townsend, signed, Aug. 30; filed, Sept. 7; cost $1600.

Laguna and Jackson. Concrete floors; owner, W. F. Whittier; architect, E. R. Swain; contractor, Geo. Goodman; signed, Aug. 16; filed, Aug. 27; cost $1816.

Lake Honda. Excavations; owner, Spring Valley Water Works; architect, Chief Engineer S. V. W. W.; contractor, A. E. Buckman; cost $4.45 per lineal foot and $9.00 for each thousand foot of lumber placed in position; signed, Aug. 19; filed, Aug. 21.

Sanders near 16th. To build; owner, A. Daveggio; architect, H. Hess; contractor, A. Christensen; signed, Aug. 16; filed, Aug. 16; cost $1620.

Leavenworth and Post. Bulkhead wall; owner, Levi Strauss; architects, Wright & Sanders; contractor, Geo. Goodman; signed, Aug. 1; filed, Aug. 15; cost $1114.

Leavenworth and Post. Granite coping, etc.; owner, Levi Strauss; architects, Wright & Sanders; contractors, Raymond Granite Co.; signed, Aug. 6; filed, Aug. 16; cost $1600.

Leavenworth and Post. Iron and bronze work; owner, Levi Strauss; architect, Wright & Sanders; contractors, S. F. Novelty & Plating Works; signed, Aug. 6; filed, Aug. 16; cost $1250.

Market near 5th. Iron stairs; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractors, Western Iron Work; signed, Aug. 22; filed, Aug. 2; cost $15,250.

Mason near Geary. Lathing and plastering; owner, Hall Assn. N. S. G. W.; architect, A. C. Lutgens; contractor, Arthur O'Brien; signed, July 17; filed, Aug. 13; cost $4344.

Mason near Geary. Painting and varnishing; owner, Hall Assn. N. S. G. W.; architect, A. C. Lutgens; contractors, Dutot & Gibson; signed, June 14; filed, Aug. 3; cost $1430.

Mason near Geary. Electric light wiring; owners, Hall Assn. N. S. G. W.; architect, A. C. Lutgens; contractor, Mathews O'Brien; signed, Aug. 14; filed, Aug. 15; cost $1300.

McAllister near Devisadero. To build; owner, J. H. Stein; architect, W. Koenig; contractors, W. H. and T. Kinrad; signed, Aug. 26; filed, Aug. 26; cost $2400.

McAllister near Scott. To build; owner, T. J. O'Brien; architect, M. J. Welsh; contractor, Jas. J. O'Brien; signed, Sept. 5; filed, Sept. 11; cost $4400. Electrical work, contractor, The California Electrical Work, $164. Plumbing, J. E. Britt contractor; cost $643. Painting, etc., Quaidi & Co. contractor, cost $78.

McLea Court near 9th. Two two-story frames; owner, Geo. Bucker; contractor, C. Andresson; signed, Aug. 9; filed, Aug. 28; cost $4800.

Moss near Howard. Completing a partly finished building; owner, J. Sanders; contractor, P. L. Bassett; signed, Aug. 14; filed, Aug. 16; cost $2540.

Montgomery and California. Metal grill work; owner, Cal. Safe Deposit and Trust Co.; architect, H. A. Schulze; contractors, Schrader & Lutze; signed, Aug. 13; filed, Aug. 13; cost $1493.

Mission near Fourth. Carpenter work; owner, A. W. Wilson; architect, B. E. Henriksen; contractors, Peterson & Olson; signed, Aug. 28; filed, Aug. 29; cost $11,100.

Mississippi near Butte. To build; owner, J. Mattson; architect, R. A. Herold; contractors, O. L. Wold and L. D. Uttman; signed, Sept. 4; filed, Sept. 5; cost $2953.

Ney and Congdon. To build; owner, Antone Metten; contractor, R. Trost; signed, Aug. 5; filed, Aug. 13; cost $1035.

Noe near Day. To build; owners, Peter Bernard and Julia Herzog; architect, C. A. Berger; contractor, Frank Doyea; signed, Sept. 2; filed, Sept. 3; cost $1700.

Ocean House Road near Arlington Ave. Grand stand and Paddock; owner, Pacific Coast Jockey Club; architect, T. J. Welsh; contractor, A. L. Campbell; signed, Aug. 14; filed, Aug. 15; cost $26,064.

Ocean House Road near Arlington Ave. Stalls 480 to 600; owner, Pacific Coast Jockey Club; architect, A. M. Allen; contractor, A. L. Campbell; signed, Aug. 26; filed, Aug. 29; cost $37.35 stall erected.

Page near Cole. To build; owner, Ferdinand Epel; architect, E. R. Swain; contractor, R. Trost; signed, Aug. 12; filed, Aug. 13; cost $3175.

Page near Broderick. To build; owner, Henry Myers; architect, W. H. Lillie, contractors, F. G. Kronnick & Bros.; signed, Aug. 10; filed, Aug. 13; cost $3350.

Ridley near Sanchez. To build; owner, James Hagerty; architect, M. J. Welsh; contractor, James J. O'Brien; signed, Sept. 10; filed, Sept. 11; cost $3400.

Sacramento and Laguna. Gas fitting, etc.; owner, Horace L. Hill; architect, W. J. Mathews; contractor, W. S. Snook & Son; signed, Aug. 22; filed, Aug. 24; cost $1784.

Sacramento near Walnut. To build; owner, Thomas K. Kelley; contractor, T. F. Mitchell; signed, Aug. 15; filed, Aug. 17; cost $2550.

Second Ave. near California. To build; owner, Geo. A. Jackson; architects, Herman & Swain; contractors, Moore & Cameron; signed, Aug. 27; filed, Aug. 27; cost $1240.

Second Ave. near California. To build; owner, Mrs. Emma Hinds; contractor, Hans Peterson; signed, Aug. 7; filed, Aug. 23; cost $1950.

Shotwell and 26th. To build; owners, J. H. and Charles Buttmann; architects, Hermann & Swain; signed, Aug. 26; filed, Aug. 28; cost $2960.

Silver near 2d Ave. To build; owners, Wm. and Sarah Kennett; architect, F. B. Wood; contractor, John Dyar; signed, Aug. 31; filed, Sept. 2; cost $3840.

Silver near 2d. To build; owner, J. W. Dreyer; architect, A. H. Wilselm; contractor, T. C. Cockrane; signed, Aug. 14; filed, Aug. 15; cost $3550.

Sixth near Channel. To build; owner, Albany Lumber Co.; contractor, Wm. Linden; cost $1200.

Stanyan near Fulton. To build; owner, Mrs. C. R. Richardson; architect, M. J. Welsh; contractor, H. Jacks; signed, Sept. 10; filed, Sept. 11; cost $4225. Plumbing, Geo. Humphreys contractor, cost $529. Painting, M. J. Donovan contractor, cost $455.

St. Marys street. Brick building; owner, Mrs. S. M. Blumenberg; contractor, Wm. Bayford; signed, Aug. 4; filed, Aug. 12; cost $500.

St. Marys street. Brick building; owner, Mrs. S. M. Blumenberg; contractor, J. F. Sweeney; signed, July 22; filed, July 22; cost $1127.60.

Sullivan near Stanyan. To build; owner, C. H. Backe; contractor, John J Walsh; signed, Aug. 12; filed, Aug. 13; cost $1040.

Taylor and Pleasant. To build; owner, Emile M. Pissis; architect, Pissis & Moore; contractors, Gardner & Boyden; signed, Aug. 10; filed, Aug. 12; cost $8869.

Taylor and Lincoln. To build; owner, Luigi Demartini; architects, Wm. Mooser & Son; contractor, R. P. Sanchez; signed, Aug. 15; filed, Aug. 16; cost $3375.

Telegraph near Onondago. To build; owners, Mr. and Mrs. L. Renner; architect, M. J. Welsh; contractor, I. W. Coburn; signed, Sept. 7; filed, Sept. 7; cost $1840.

Twentieth near Guerrero. To build; owner, Richard Barry; architect, C. J. I. Devlin; contractor, James Irwin; signed, Sept. 5; filed, Sept. 11; cost $2588.

Twenty-second near Florida. To build; owner, John H. F. Richtotieg; contractor, L. Oversterland; signed, Aug. 14; filed, Aug. 14; cost $2300.

Twenty-fourth near Hampshire. To build; owner, Thomas Gagan; contractor, T. F. Mitchell; signed, Aug. 14; filed, Aug. 15; cost $2950.

Union near Jones. Carpenter work, etc.; owners, Kalz & Sons; architect, A. C. Lutgens; contractor, W. Tegeler; signed, Aug. 13; filed, Aug. 15; cost $2925.

Union near Jones. Excavations, etc.; owners, Kalz & Sons; architect, A. C. Lutgens; contractor, J. F. Wagner; signed, Aug. 13; filed, Aug. 15; cost $1267.

Union near Devisadero. To build; owner, Mrs. Mary B. Agus; architect, J. H. Littlefield; contractor, O. E. White; signed, Aug. 23; filed, Aug. 26; cost $6488.

Union near Devisadero. Excavations, etc.; owner, Mrs. Mary Agus; architect, J. H. Littlefield; contractor, H. H. Larsen; signed, Aug. 23; filed, Aug. 24; cost $1303.

Union near Devisadero. Additional contracts; owner, Mary B. Agus; architect, J. H. Littlefield; concrete, Keatinge, Leonard & Ransome, cost $925; plumbing, etc., Flood & McDonald, cost $990; painting, Charles Cornberger, $190; mantels, not let, $75; gas fixtures, etc., $650; total cost $4670.

Waller near Laguna. To build; owner, William L. Helke; architect, W. H. Sorrell; contractor, D. Currie; signed, Sept. 7; filed, Sept. 11; cost $4759.

Washington near Webster. To build; owner, Sidney M. Smith; architects, Rughee & Gash; contractors, M. C. Brennan & Sons; signed, Aug. 17; filed, Aug. 17; cost $5600.

Webster near Green. Five two-story frame dwellings; owner and builder, J. B. Mathison; cost $50,000.

Welsh near Fourth. To build; owner, Jeremiah McCarthy; architect, A. J. Barnett; contractor, L. Westerlund; signed, Aug. 27 filed, Aug. 27; cost $2300.

Williamson near Pt. Lobos. To build; owner, M. E. Guildea; contractor, O. W. Forsyth; signed, Aug. 6; filed, Aug. 20; cost $1250.

The California Architect and Building News.

Copyrighted 1895, by the California Architectural Publishing Company.

OFFICE, 408 CALIFORNIA STREET, SAN FRANCISCO, CAL., U. S. A.

VOLUME XVI. OCTOBER 20th, 1895. NUMBER 10.

A MONTHLY JOURNAL DEVOTED TO THE ARCHITECTURAL INTERESTS OF THE PACIFIC COAST.

Published on or about the 20th of each month by The California Architectural Publishing Company. The Stockholders being Architects and others interested in the profession.

SUBSCRIPTION TO THE JOURNAL, - $3.00 PER YEAR IN ADVANCE.

NOW IN THE SIXTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

IT is undoubtedly a fact that the business of this generation is controlled by different principles and conditions than have heretofore obtained. Our predecessors were content to achieve success. The merchants of to-day are not content with success alone, but must strive for the extermination of business rivals, by combinations that do not seem to us to be founded on principles of right and justice, but on the contrary that seek to destroy that equality of opportunity that we have so long boasted was guaranteed us by the Constitution of the United States. Our legislation has in vain attempted to suppress or control these combinations when they become so powerful as to threaten the well being of society, but until a healthy public opinion is found strong enough to effectually discountenance such proceedings, but little permanent improvement can be hoped for. As a case in point we understand the Master Plumbers' Association of San Francisco, have entered into an agreement with the jobbers of plumbing supplies of this City, that in consideration of the members, belonging to the association, buying all their supplies from the jobbers of this city, exclusively, the jobbers on their part will sell plumbing goods only to those that are members in good standing of the Master Plumbers' Association. We believe there are over 200 licensed plumbers in this city, of which over 100 belong to the association. By reason of this action, nearly, or quite one-half of the licensed plumbers of this city will be obliged to go out of business, be forced into joining the association, or go abroad for their supplies; which, in many cases would work a great hardship on them by reason of not being known abroad, and only wanting goods in small quantities it would not pay them to do so. It is well known that all fine plumbing goods, such as bath tubs, and other specialties are not manufactured on this Coast, and have to be imported from the eastern manufacturers; and although we strongly believe in encouraging home products as also giving to local business houses their patronage in preference to buying abroad we cannot conceive how any business man should be obliged to buy such goods in this market from local houses when he can buy the same goods abroad for less money. It appears to us a hard matter for one set of men to band themselves together and say to others, "You must join with us or we will drive you out of business." In this case the point cannot be made that it is sending money abroad, that can be kept here, for in any case the jobbers would have to order these goods from the East and send the money there to pay for them. Plumbing has now arrived at such a point, that only the very best sanitary appliances should be used. And as we have remarked to a very great extent this class of goods are only manufactured by the large Eastern concerns, the policy should be to buy this class of goods where they could be bought the cheapest, and thus enable owners to get the best goods for the least money. To say to any set of business-men, "You must buy your goods where we dictate," is arbitrary, unbusiness-like, and against public policy. The tendency in all business now is to deal directly with the manufacturers and not through secondary parties or middlemen whenever it is expedient to do so. We are certainly in favor of trade

organizations for their mutual benefit and advantage, but on the question of individual members of same being dictated to as to how or where they shall buy goods appears to us as going beyond the province of associations of this kind.

THE hightest talent in the way of Architecture should be enlisted to provide a design worthy of such an occasion as the erection of an enduring and monumental building such as that for the Affiliated Colleges about to be erected in San Francisco.

It is therefore to be hoped that the Board of Regents of the University and the Commissioners Appointed from the Affiliated Colleges will see their way to open the plans to competition either by all or by a selected few—in either case providing liberal premiums to the unsuccessful—and thus encourage their sister profession of architecture, who although not having the good fortune to be housed in the contemplated building will however thus have a hand in putting up a monument worthy of the use of the other professions.

AS the height of buildings in this City of San Francisco has been decided upon as 125 feet for streets over 100 feet wide and 100 feet for those under, we make a resume of the arguments *pro* and *con*.

1st. The advocates of high buildings argue that limiting such height would work an injustice to those capitalists who have invested in land at high figures in the central part of town—and who cannot now make interest on their investment unless the number of stories in their buildings are large enough to allow of rents sufficient to pay such interest.

To which the advocates of low buildings reply that the interests of the public at large and those of adjoining or opposite owners who may not be blessed with so much worldly goods as the high building capitalists are in the aggregate more important than the interest on the investment of those few who are able to put up such high buildings.

2d. The high building advocates secondly state that the appearance of a town is improved by having high buildings, in that it makes such City appear of a more business-like character or more metropolitan—and that therefore the wellfare of any City is subserved by having tall buildings therein.

This is answered by their opponents by stating the fact that the two most metropolitan cities in the world—London and Paris have no tall buildings in the modern acceptation of the word and have stringent laws preventing the erection of the same and it is only where by reason of topographical causes such as work both in New York and Chicago that we find so many of them.

3rd. Another reason giving for the existence of high buildings is that it concentrates commerce and business in small area and thus allows the same to be transacted easier.

To which is replied that the health of those engaged in their business who are compelled to spend a good part of their lives amongst these surroundings is more important even taking it in an economical sense than the small gain by such concentration—and the increase of land values on the outskirts of the business area—by having the business part of a town spread latitudinally compensates fully any inconvenience caused by the greater distances of said business area.

It seems to us that all these conflicting interests would be harmonized by the adoption of the rule that no part of a building on one side of a street should extend beyond a line drawn from the foot of the building on the opposite side of the street, at an angle of forty-five degrees, this gives the public and the adjacent owners of property their share of sunlight and air—and at the same time allows a man to build as high as he likes on the rear portion of his lot, as long as he does not obtrude upon that forty-five degree line.

HIGH BUILDINGS.

THERE are evidences that we are soon to have in this City a renewal of that controversy over high buildings which began years ago in Chicago, was continued in New York and other cities of the East, and has been practically concluded in that section of the country by a victory everywhere for the advocates of the new form of architecture.

The objections to high buildings, or "skyscrapers," as it is the fashion to call them, grows out of the natural conservatism of man. Some people dislike any change simply because it is a change. Others see that a change in any one thing will break the existing relation with other things around it and fear the new condition will entail danger or loss somewhere. One of these objects is about as futile as the other. Changes for the better there have been since the world began and must be so long as man is capable of learning new things. Nor does any one change long disturb the harmony of the complex relations of life. It simply brings about other changes in other things until a new adjustment is reached and thereby proves not only a benefit itself but the cause of further benefits in many ways.

Tall buildings are a development of the age, and, like all such developments, have resulted from needs engendered by existing conditions. No one planned them as an inspiration. They grew by slow degrees in response to the demands of modern life. If they introduce new problems they brought also the answers with them. They have been opposed everywhere and everywhere they have been accepted. A hard fight was made against them by the Fire Department in Chicago, but it ended not by checking the buildings but by improving the fire service; and so great was the improvement that only a short time ago the Chicago *Times-Herald* predicted a complete revolution in the methods of fighting fire in that city before the close of the year.

The high building, as we have said, did not come by inspiration of genius. It is a need of the time. A law prohibiting such buildings would lower the price of every foot of land anywhere near the center of the City. No one would purchase a lot at a high price if he were not to be permitted to erect upon it a building high enough to obtain in rents a fair return upon his investment. If the land-owners of San Francisco are to enjoy as full use of their property as land-owners in other American cities they must

be as free here as elsewhere to make every use of modern architecture and engineering in improving their property by the constructions of such buildings as the requirements of the time demand.

It is hardly likely that the controversy here will be waged either so long or so warmly as it was waged elsewhere. It is in fact a virtually exhausted issue. It has been argued over and over in the East, and every possible problem involved in it has been discussed and solved. It is no longer a question between New York and Chicago as to whether they shall have high buildings, but as to which shall have most and highest.—*Call.*

TALL BUILDINGS.

WE have received the following from one of our correspondents, but don't propose to become responsible for the remarks made therein.—*Ed.*

"Get out of my sunlight" said Diogines as he past, but as he turned to see whence came the obstacle to his sunlight he saw how futile were his commands and passed on as quickly as his easy going temperament would allow out of the Shadow of Death caused by the Tall Buildings. "Duce take these tall buildings," remarked the young lady, "I shall have to wear my bloomers in the future," rough Boreas by the aid of the tall buildings twisted her skirts, threw her cape over her head and otherwise maltreated her. As the philosopher and philantropist came along the problem came to them as they shivered and craned their necks to take in the monstrosity—"What must be the power of greed that prompts a fellow man to destroy his neighbor's health by depriving him of what ought to be free to all—Light—to destroy the beauty of the City in which he lives by ill proportioned erections and prevents his fellow property owner from gaining the advantages of an extension laterally of the City—and form a menance to the citizens when mother earth takes to shaking herself or the fire fiend lights up its inaccessible lights.

THE HEIGHT OF BUILDINGS.

IT is a familiar doctrine of the common law that one who owns a piece of land owns from the center of the earth to the very sky itself. His fee simple title is not to be questioned, save where he infringes upon or interferes with the rights of his neighbors.

There is a tendency in recent years to modify the rule of the common law, but such tendency should never be extended beyond reasonable limits. For example, the restrictions sought to be put upon the height of buildings in this City should be tested by the canons of expediency and common-sense, and there should be no limitation fixed upon the construction of a building unless some good and sufficient reason can be given for it.

In many of the European cities, where the streets are so narrow as to be only lanes or alleys, it is obvious that high buildings must be a serious detriment to those who inhabit the sunless side of the street, but in a City like this, where the streets are sixty, eighty and even more than 100 feet in width, that argument possesses no force or validity. A solid block of fifteen-story buildings on Market street could not exclude air or sunlight from these on the opposite side of the street.

Modern buildings in the business portion of a city are uniformly built as nearly fireproof as possible, and hence the Fire Department argument cuts little or no figure. If those members of the Board of Supervisors who seem to be so strongly opposed to high buildings would take action in behalf of an extension of the fire limits they would do much more to guard against the risk of a general conflagration than by objecting to tall buildings.

The height of buildings is purely comparative and it would be just as reasonable for the owner of a one-story cottage to object to his neighbor building a two-story house as for the owner of a six-story business block to object to his neighbor erecting a twelve-story building. As to sanitation and all that the term involves there is no modern building in the City which is not thoroughly supplied and equipped with the best of sanitary appliances.

It would be interesting to know the source of this newly developed zeal against high buildings in this City, when it is perfectly well known that all the high buildings, beginning with the Chronicle building, which was the pioneer, are models of fire-proof, well-ventilated and thoroughly sanitated structures. There is something more in this recent movement than appears on the surface.—*San Francisco Chronicle.*

THE ANTI-HIGH-BUILDING MANIA.

THE anti-high-building mania has extended to San Francisco. It would seem impossible for it to go further westward, were it not that the United States has territory extending as far to the west of that city as it has to the east of it. But San Francisco is far enough. It is harh to understand the agitation that has arisen against these vast modern structures. It is true few architects know how to design them, and most of those who have undertaken to explain why they should be banished from off the face of the earth have not been noted for the manner in which they have solved this difficult problem. I trust I will not be deemed too personal when I say I should be glad to own a dozen of such structures, and I will undertake to point out a million people in New York alone who entertain the same opinion. Surely every architect who condemns them would be glad enough to get an opportunity to design one every six months or so.

The truth is the high building problem is not one to be decided by architects or building law commissions. It concerns questions of law, of equity, of real estate, of municipal development, of public convenience, of business methods, of a host of things the architect has no business with, and of which, on other questions, he would have nothing to say. The problem is one that will settle itself; the moment the market is over supplied their erection will come to an end, and the agitators will have to find other things to talk about.

A very narrow street, lined on either side with fifteen and twenty-story buildings, is something dreadful to think of, no doubt. Yet if I owned a piece of land, and my neighbor built up twenty stories, I should not sit down quietly under a law that, a few years later, said I could only build to half this height. Nor should I, were I a real estate man, feel pleasantly toward the architects and other busybodies

who had been instrumental in securing the enactment of such a law. The large cities do not suffer the danger from the large office building, well built, well lighted, provided with every comfort and convenience, carefully watched—a scientific monument of the resources of our time—as they do from the little old houses of the back streets, filled with squalor and filth of every description, and harboring, it may be, the larger part of the city's population. Communities engaged in regulating the dimensions of buildings might make an application of the warning not to take the mote out of their brother's eye while there is a beam in their own. Let the cities get rid of the bad first, and then see what can be done to make the good better.—*Architecture and Building*.

INSPECTION OF STEAM BOILERS.

THE Boston Manufacturers' Mutual Fire Insurance Company, which is often the first to investigate matters related to the art of building, publishes a circular of great interest, in which it says that it has always declined to undertake boiler insurance, but that, under a recent statute of Massachusetts, all users of boilers will be obliged to insure them in an authorized company, or to submit to a State inspection, says *The American Architect and Building News*, which may be insisted upon at inconvenient times, and may possibly involve the injury of the boilers by the operations of incompetent inspectors. As mill owners will not like either to run the risk of having their boilers spoiled, or blackmail levied on them, by political heelers, decked out as boiler-inspectors, or to be compelled to take out policies in a certain company, on the company's own terms, it has occurred to the Mutual Company, or rather, to Mr. Atkinson, its President, that it might be judicious to collect a body of information in regard to the construction, setting and use of steam-boilers, which would be useful to persons interested, and might form the basis for a rational system of insurance, similar to that which has revolutionized mill-insurance throughout New England, and, by cheapening the cost of manufactured goods, through the elimination of the greater part of the fire-losses incident to the business, which of course, are added in the long run to the price of the goods, has saved the consumers of such goods many thousands, perhaps millions, of dollars. In England, a Steam Users' Association already exists, under the charge of a very distinguished engineer, with headquarters at Manchester. This Association insures boilers, and its investigations, as our readers know, have had great influences on the designing of steam-plants in England. With the rapid development of our manufactures, it is quite time that something of the kind should be established here, and Mr. Atkinson's plan is a promising one.

He proposes that the members of the Mutual Company over which he presides, together with any others interested in the matter, who are willing to pay the three dollars subscription required of all the participants, should, if they have any real knowledge of the best material for setting boilers, of the method of avoiding waste of heat in baking the ground underneath, of the prevention of smoke, the best construction of chimneys, and the best type of boiler for a given service, furnish such information on the subject as they can. Meanwhile, two experts are to investigate boilers and steam-making, one in Europe, and the other in this country, their inquiries to extend over a year. They will make occasional reports, which will serve, later, as a basis for general rules. These reports will be printed, without, however, disclosing the identity of the plant which may form the subject of a discussion, and the printed slips will be distributed among the subscribers. Of course, the work will only be undertaken if the subscriptions warrant it; but there should be no doubt of this, for the subject is one of immense importance to a great number of people. Many architects will, we are sure, be greatly interested in the results of the investigation. At present, every architect is called upon for advice in regard to steam-plants to be established in hotels, apartment-houses, stores and office-buildings. In many cases, the consumption of coal under boilers put in under his observation reaches several tons a day, and a saving of ten, or fifteen, or twenty-five per cent in coal is of great importance to the owners. As a rule, architects disclaim anything but the most general knowledge of steam-work, and would not undertake to give expert advice on the subject; but the ridiculous claims made to their clients by the drummers who represent various patent devices, and whose efforts to effect a sale would put Baron Munchausen to the blush, often call them out, in spite of themselves, in defence of the established principles of steam-production. Most of them would be glad to add to their store of knowledge on the subject, and it is certain that the reports, made under the auspices of Mr. Atkinson and his Company, would furnish as rational and well-considered information as it would be possible to obtain.

LOSS OF HEAT BY UNPROTECTED STEAM PIPES.

RECENTLY Mr. Albert Haacke fitted up an apparatus for measuring the amount of heat lost by radiation from steam pipes, and has published the results of some of his first experiments, together with a description of the arrangement. The tests were directed to determine the relative losses of heat from (1) bare pipes; (2) pipes covered with one inch of composition; and (3) pipes covered with one inch of composition and three layers of hair felt. The testing surfaces are represented in Mr. Haacke's arrangement by three cast iron steam pipes of five inches internal diameter and six feet long, with blank flanges on each end. Those test pipes are supplied with steam that has been dried, and are placed so as to be subject to radiation and convection under precisely similar conditions, one being bare, the other covered with composition one inch thick, the third with one inch of composition and three layers of No. 3 felt, each one-half inch in thickness. The result of experiments with steam in the different pipes under pressure of from 45 to 60 pounds upward goes to show that a covering of composition one inch thick saves, out of a possible loss of 100 per cent, as much as 83.57 per cent, and if over this covering 1½ inches of hair felt with canvas is added, the extra saving is only 8.25 per cent. If one pound of coal is required to evaporate eight pounds of water into steam of 60 pounds pressure, then 6½ cwt. of coal are required every year to make good the loss of heat from every square foot of uncovered steam pipe. This loss is even greater in winter, or when pipes are exposed to cold air, or where steam of high temperature is used.—*Heating and Ventilation*.

CHICAGO ARCHITECTURAL CLUB.

THE Chicago Architectural Club held a "Bohemian Night" at the Club House, October 14, 1895. The delicatessen was provided by A. Woltersdorf and Hugo Arnold and was or was not hard to take according as the participant were in bad health or not.

Interesting competion drawings for a City House of Moderate Cost kindly loaned to the Club by the Brick Builder Publishing Company of Boston were on exhibition.

IRON SAND.

A PECULIAR industry in connection with the granite trade is the manufacture of iron sand. This curious and interesting process as carried on at the Pioneer Iron Works, Aberdeen, is as follows: Into an opening at the top of a firebrick cupola, with an outer casing of iron, are thrown from an elevated stage, coke and bits of old cast iron—railway wagon-wheels, cannon-balls, agricultural implements, etc. A fierce heat is kept up in the cupola by means of fans driven by a steam-engine. The metal when melted finds its way out at the foot of the cupola down a spout, and a powerful steam blast sends it flying in white-hotel spherical globules into a brick chamber containing a tank with cold water. On taking off the litter door at the observation hole, and peeping cautiously in so as to avoid a hot particle invading the eye, one can see the spherules dropping in a shower on the water, causing a host of tiny explosions. Such is the strength of the blast that the sparks fly out now and then at the chinks of the iron doors at the other end of the brick chamber, and strike the wall fifty feet at least from the cupola. Among old iron railway chairs are perferred. The writer of this paragraph on his visit saw an old cannon, twelve feet long, lying on the ground, ready to be broken up and cast into the smelting pot. The melting operations over, the water is run off the tank. The spherules are then collected and spread on sloping iron platforms to dry for a day or so. There are seven steam-pipes at intervals to aid in the drying part of the process. The material is then riddled by wire sieves moved by steam-power, and falling down a spout is collected and put up in cwt. bags for sale, or stored in the sheds in loose heaps. This portion of the premises is ventilated by a louvre ventilator and an iron funnel. It is in the riddling that the superiority of the Aberdeen plan over the system prevailing in the United States comes in. At the Pioneer Iron Works seven different sizes are produced, the present retail price of the finest being £6 a ton in Aberdeen. The sizes vary from a very fine powder to No. 1, which about equals No. 6 shot. Iron sand is, in fact, generally called chilled shot by granite workers in Aberdeen. Of the intermediate sizes No. 4 resembles clover seed in dimensions, and No. 3 would about equal the pellets known among sportsmen as sparrow-hail. Iron sand is used for sawing and polishing granite. For ordinary steam saws (which are made of mild steel) the largest variety is employed. These saws when in motion are fed with the iron sand and with water. The water washes out the iron sand, which is caught in a box and utilized over and over again until used up. For nice sawing, when the granite is cut perhaps an eight of an inch thick, to be polished on both sides for fancy caskets, samples, etc., the roughest kind is not used. The three finest grades are used in the first stage of machine polishing. When iron sand is used the stones do not require to be dressed so finely before being machine polished as they did when sea sand was used. The employment of iron sand enables machine polishing to be executed about three times as fast as when sea sand was used, and about ten times less of it is necessary. Emery or sea sand is, however, used for hand polishing at all stages, and emery is also employed in the second stage of machine polishing.—*Stonemason*.

A UNIQUE CHURCH.

THE Presbyterian church society of Waterloo, Iowa, is possessed of an edifice which can well claim to be one of the unique buildings of the world, so far as relates to the material of its construction, for it is built substantially of stone taken from one hugh bowlder. The stone from which the church is constructed, says *The Architect, Builder & Decorator*, weighed more than 5,000,000 pounds, and was therefore about twice as large as the bowlder from which was hewn the pedestal on which stands the statute of Peter the Great in St. Petersburg, though not so large as the great bowlder called Pierre de Marmettes, at Monthey, in the cannon of Valais, on which a chalet was built. When in 1890, the Rev. C. H. Purmory and the members of the Waterloo Presbyterian church decided to erect a new place of worship and began to look for stone in a section where stone is scarce, their attention was called to what was apparently a very large bowlder situated two miles from Waterloo, a part of which projected eight feet from the ground. Work of excavating the great stone was begun. Eight feet of rich dark soil was penetrated, then six feet of sand of different strata and seven feet of blue clay before the bottom of the bowlder was reached. This clay indicated the ooze of a pre-glacial swamp where the ice floe had left the bowlder after carrying it from the far Northwest, and the sand showed the action of depositing water, which, for many years, had been preparing a moisture carrying flow on which afterwards was lain the thick stratum of loam. When exposed as the bowlder stood, it was found to be twenty-eight feet high, thirty feet wide and twenty feet thick. On this monolith the workmen began their labors with drill, powder and sledge, and soon the Napoleon of bowlders met its Waterloo. The pieces were carried to the pretty town, and in a short time a wonderful metamorphosis was apparent and the gigantic bowlder, after resting undisturbed and nearly buried by the deposits of ages, was transformed into a beautiful temple of a religion that was not dreamed of when the great stone started on its journey in the grinding embrace of a mighty glacier. The desire for a slight variety of color was all that prevented this bowlder from furnishing absolutely all, instead of substantially all, of the stone for the church. A few small bowlders of varying hues were used in the building to meet the requirement of architectural taste, and the result has been a most beautiful as well as unique church.

Mr. Whitewings—"Say, I hear you've been a-callin' me a fool. Uncle Pete—"I didn't call yer a fool. I ain't no sech fool as to say eberyting I tinks."—*Munsey's Weekly*.

ONE ON THE LAWYER.

WHERE is a story on record of an architect repudiating any connection with the building fraternity in the case of the late eminent and talented Mr. Alexander, the architect of Rochester bridge and several other fine buildings in the county of Kent. He was under cross-examination in a special jury case at Maidstone, by Sargeant—afterwards Baron—Garrow, who wished to detract from the weight of his testimony, and who, after asking him what was his name, proceeded thus: "You are a builder, I believe?"

"No, sir; I am not a builder; I am an architect."

"Ah, well; architect or builder, builder or architect, they are much the same, I suppose?"

"I beg your pardon, sir, I cannot admit that; I consider them to be totally different."

"Oh, indeed; perhaps you will state wherein this great difference consists?"

"An architect, sir, prepares the plans, conceives the design, draws out the specifications—in short, supplies the mind, the builder is merely the bricklayer or the carpenter—the builder, in fact, is the machine; the architect the power that puts the machine together and sets it going."

"Oh, very well, Mr. Architect, that will do; and now, after your very ingenious distinction with out a difference, perhaps you can inform the court who was the architect of the Tower of Babel?"

"The Tower of Babel, sir!" replied the witness. "There was no architect—and hence the confusion!"—*Ex.*

THREE GREAT CITIES.

IN all the countries of Europe, in the United States and in the Dominion of Canada there are, so far as recent and authentic figures show, 70,000,000 houses. There are 342,090 houses, some of them unsubstantial affairs, in the city of Tokio, one for every five people, so that the Japanese metropolis does not suffer from overcrowding.

New York has 115,000 houses, averaging eighteen residents to each. London, the greatest accumulation of inhabitants in the world, has 600,000 houses, or seven residents in each on the average. London has increased in this respect very rapidly, for at the beginning of the present century the number of houses was only 130,000, little more than New York has at this time. The population of London at that time (1800) was 960,000. It is now 4,200,000. So it has increased nearly five fold, but the number of houses has not increased in as large a ratio.

Paris has 90,000 houses. At the close of the Franco-Prussian war it had 70,000. At the close of the Napoleonic wars it had 28,000. The area of the city had extended meanwhile. The average number of residents in a house in Paris is twenty-five, which is about fifty per cent greater than in New York. The majority of public buildings in Paris are utilized for purposes of residence, especially upon the top floors, whereas in New York scores of the buildings in every street down town are given over exclusively to business purposes. In a square mile or more of the territory between Wall and Spruce streets and between Broadway and the East river there were at the recent election only 430 votes, representing a total population of 1750.—*New York Sun.*

TRINITY CHURCH, BOSTON.

ARCHITECTS, and other persons interested in architecture, who happen to be in Boston, should not fail to make a visit to Trinity Church, and study the detail of the new porch, on which the carvers are busily at work. It is hardly necessary to say that the work is interesting, and to the extent compatible with correctness of style, original; and this porch, which is thoroughly Romanesque in the variety and richness of its detail, has afforded a fine field for artistic expression. The opportunity has not been lost, and we do not know a piece of exterior architecture in this country of the same extent, which will hold the attention of a student for a longer time, and with more satisfaction. The staging, of course, affects for the present the lighting of the pretty little singing cherub heads which swarm in the cornices and gables, so that the necessary allowance must be made for all the circumstances; but even as it is, the richness and interest of the sculpture, the delicate profiling of the columns, contrasting with the deep shadows and the solidity of the massive stonework, produce an impression which, to our mind, cannot be obtained elsewhere on this side of the Atlantic. As to whether the alterations improve the original building, "that is another story."—*The American Architect and Building News.*

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

PRINCESS Angeline's Chief Seattle's Daughter Palace, J. W. Krause, 1894.

MILNER Building, Main street, Los Angeles; 40'x87' buff Roman brick; two stores and twenty-six rooms; plate glass front; Hudson & Krause, Architects, cost $18,000.

SKETCH for a Town Tower, C. L. Taylor, del.

WE received too late for publication in this number of our Journal, a valuable report of the Committee on "Strength of Bridge and Trestle Timbers," presented at the Fifth Annual Convention of the American International Association of Railway Superintendents of Bridges and Buildings at New Orleans, La., Oct. 15, 1895. Mr. Walter G. Berg was chairman of the committee.

GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

THE RIGHT OF AN ARCHITECT TO A LIEN ON A BUILDING.

A RECENT decision in the United States District Court in the Northern District of Ohio, gives the architect the right to a lien on a building for his services. The Judge in his decision says: "There is no reason in equity or law why the architect who conceives and puts upon paper the design of such an immense building as that involved in this case, and who puts upon paper with such minuteness of detail the specifications and drawings as to enable any one skilled in such business to erect, with perfect proportions and proper stability, such a mammoth structure, should not be protected in his contribution to the completion of such work as well as the carpenter, the plumber, the painter or any one who performs manual labor. The court certainly ought not to strain the statute to exclude labor of this high character and grade unless it is plainly the intent of the Legislature that it should bear such interpretation. The architect in this case is entitled to a lien not only for the plans and specifications, but for the labor and assistance in the construction of the building in pursuance of these plans." This seems certainly in accord not only with the dictates of common sense, but with the equitable rules of justice.—*Architect and Builder.*

SCHOOL OF ARCHITECTURE.

THE School of Architecture at the University of Pennsylvania opens this fall with the largest Freshman class in its history, a class more than double that of the previous year.

The recent growth of the School has rendered necessary the appointment of two additional instructors, which increases the teaching force to eleven. Mr. Frederick N. Mann, graduate of the Massachusetts Institute of Technology in 1894 and in 1895, and Gold Medalist in the competitions of last year of the Society of Beaux-Arts Architects, has been appointed to the Instructorship in Design and will have charge of the Junior work in this subject. Mr. Lewis Frederick Pilcher, graduate of Columbia College in 1895, will take charge of the work in Archæology and will assist in the general architectural studies of the first year.

ART AND LABOR.

I HAVE never seen in a city anything in the way of decoration upon the house of an American citizen which he had himself designed and wrought for pleasure in it. In the house of an Italian peasant immigrant in our own neighborhood, I have seen wall and ceiling decorations of his own design, and done by his own hand in colors. The designs was very crude, the colors coarse; but there was nothing of the vulgar in it, and there was something of hope.

Could men build their own houses, could they carve or fresco upon casing, door or ceiling any decoration which pleased them, it is conceivable that, under conditions of freedom and happiness, they should refrain from doing so. It is inconceivable that, adorning their own dwelling, in the gladness of their hearts, they should not develop something of grace, of beauty, of meaning, in what their hands wrought; impossible that their hands should work on unprompted by heart or brain; impossible then, as invevitable now, that most men's houses should express nothing of themselves save a dull acceptance thrust upon them.

ELLEN GATES STARR.

A CHANCE FOR ARCHITECTS.

THE well-known political economist Professor Richadr T. Ely, in a paper devoted to the study of the practical results obtained by government ownership and control of railroads in Germany says: "One of the greatest improvements in Germany during the past fifteen years has been in the construction of stations. The railway stations in Germany at the present moment are so far beyond all controversy the most beautiful and convenient in the world, that for any one to deny it must be taken simply as a proof of ignorance or misrepresentation. These stations are constructed with a view to architectural effect. Before the station in Frankfort was constructed there was a prize competition of architects, just as there has been for the construction of the new Episcopal Cathedral in New York, and after the examination, the design which was regarded as in every way most satisfactory was selected. The result can be seen in that magnificent station which, taking it all and all, is probably the largest and most beautiful in the world."

"Doctor, I wish you'd go up to Mrs. Blank's and see my friend Jarret, the actor—he is very sick." "Sir," replied the Doctor, "curing hams is not my specialty."—*News Letter.*

THE SMALL TOWN AND THE TROLLEY.

IN a short editorial the *American* calls attention to the decline of the small town. That this is a fact any one at all familiar with the older States recognizes at once. The writer at one time had occasion to take a trip over the post road running through the southern tier of countries in New York State and found many centres in a state of decrepitude where once was great activity. These towns were the stopping points of the old stage lines and were centres of large farming districts, and at the time of this trip the old taverns were dilapidated and blacksmith shops, harness shops, stores and all the business of a once thriving village departed and but the decaying shells left. This the old inhabitant attributed to the railroad destroying the business of the stage lines and removing the centres of business. Similar conditions may be found in all parts of New England, much of Pennsylvania as well as New York State. The question arises whether this condition of things is to be permanent and whether the great railroad lines are to continue to build up great towns and great cities at the expense of smaller rural towns, and cause the decadence of the surrounding farming districts.

In considering this question we must recognize new influences that are likely to have a large effect on these scattered settlements. One of the most powerful of them is likely to be found in the trolley. Its use is cities has long been recognized and its influence in the country is equally recognized, as is evidenced by the opposition of the great railroads to those roads where they paralleled their roads. The advantage of the trolley is to be found in the ease with which they can be laid on the ordinary country road. These trolley roads can not only be adapted to passenger traffic but equally to freight, and may thus open again the old post roads and afford transportation facilities to vast sections without railroad facilities, and rebuild these old villages and improve farming districts where the expense of ordinary road transportation have cut them off from the markets. In fact the very roads that have been opposing them in the legislatures may find them their most important feeders. It seems quite within the bounds of reasonable expectation that the trolley may afford transportation facilities at such rates for farm produces, garden truck, milk and manufactures from farms and villages too remote at present from railroad centres to be under present conditions profitably produced, but which with such aid will become profitably industries. The difficulties of transportation consign to inactivity many farming sections and villages, under present conditions, which electric roads would turn into active and prosperous communities. It is certainly among the possibilities that electricity may bring about a renaissance of the old village and farm life that prevailed in the country fifty or more years ago. The healthy conditions that are to be found in small factory villages and on profitable farms are much to be desired, and it is possible the work of the trolley may be more far-reaching in its results than we at present anticipate.—*Architect and Builder*.

Lady (seeking a nurse girl)—"Is she not rather short?" Proprietor—"That is not an objection. You see, should she drop your child, it could not fall far."—*Pittsburg Bulletin*.

J. CATHER NEWSOM, ARCHITECT.

SALT WATER IN FIRES.

THE recent disastrous fire in San Francisco, when $1,000-000 worth of property was destroyed, shows the lack of a proper system of fire protection. The water pressure was altogether too low. With a view to remedying this evil, which is recognized by the authorities, the Olympic Salt Water Company of San Francisco, has for some months past been laying its mains, and intends to bid for the patronage of the city. The company proposes to offer the city free of cost all the salt water needed for sprinkling purposes in the section where their mains are laid and their hydrants set. Fighting fire with salt water is not an experiment, but has been successfully used in England for years. It has been proved beyond question that salt water is best adapted for fire purposes, and there are several reasons why this is so. First, the density of the water does not allow it to evaporate so readily, thus allowing it a longer period to get in its destroying power. Again, salt water weighs sixty-four pounds to the cubic foot, as against sixty-two pounds for fresh water. The difference of course is found in the salt. It is claimed that one service of salt water is equal to three in fresh. Returns from seventeen English cities where salt water is used for sprinkling purposes show that the streets have gradually become macadamized. The mortality has also decreased from twenty to thirty per cent. The Olympic Company has a reservoir with an elevation of 320 feet above the city. The reservoir is on Point Lobos avenue, near Josephine street, and has a capacity of 4,500-000 gallons.—*Fire and Water*.

BOOKS AND PERIODICALS.

DYMANO ELECTRIC MACHINERY by Carl Mac Fadden and William D. Ray—has been published in Chicago by Laird & Lee. This handy volume is illustrated; a likeness of Thomas A. Edison shows a face of wonderful determination. Price one dollar, this is a book that should go into the hands of every one interested in this fast growing business that is daily increasing in importance.

LEND A HAND for October, published in Boston by J. Stillman Smith & Co., is an unusual interesting member, the leading article "The Progress of the Century" by Rev. Edward E. Hale will well repay a careful study, coming at this time when the author has suffered the last of a cherished and promising son just entering upon what promised to be a useful life. Anything from the pen of such a father must be read with interest.

The "Tenement House Question" by Margaret Bradshaw is also an article that will call carefull attention to this much vexed question and gives much information that will be of great service to those who wish to attempt the improvement of the Tenement House.

A valuable little work on the practical application of

THE NEW SCIENCE REVIEW for October, 1895.—This able review is always welcome because we suppose that it always contains some articles that set the reader a thinking, and asking the question can this be so.

"Apergy" Power without cost by Charles Morris: this writer claims that John Ernest Worrell Keely, the inventor of the notable "Keely Motor" has nearly made a useful invention or discovered a new farce.

John Jacob Astor in his romance called "A Journey in Other Worlds" makes use of this power called "Apery" to propel his vessel to unknown regions in the upper air.

The article on "Vivisection" shows conclusively that no gain to science has ever been gained by this cruel practice and that its sole result has been the brutalizing of the medical student and physician into those abnormal beings which are frequently met with amongst those who indulge in this horrible pastime.

THE ARCHITECTS' DIRECTORY.—"The Architects' Directory" for 1895–96, containing a list of the architects in the United States and Canada, classiged by States and towns, giving the architectural associations to which they belong, has the publisher states, been prepared with great care to secure accuracy of both name and location. It is published by Wm. T. Comstock, 23 Warren street, New York, bound in red boards, gilt title, 16mo. price $1.00.

In comparing this directory with the last year's issue a great multitude of cuarges are noticeable. The effect of the last two years of dull business have had a marked effect on the profession of architecture. In the West especially, the change has been great; many towns that had several architects, to-day are unrepresented. Lack of business has compelled practitioners to seek other fields or different lines of employment. The list, by the many changes made, shows careful revision and an earnest effort to obtain the utmost accuracy. Any one who has had the least experience in preparing an accurate list of any calling must see how much effort it is to secure it. A reference to these pages will show that carefull work has been done in this case, and we feel that both architects and material men will appreciate the efforts made to secure a correct list of architects.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

MECHANICS' LIEN CANNOT BE APPLIED TO SCHOOL PROPERTY.—The right to a mechanics' lien has no existence, except by virtue of the statute. While a liberal construction should be given to its provisions, to the end that the purposes of its enactment may not be defeated, still its scope cannot be enlarged by attaching to the language employed a forced or unusual meaning. The rights and remedies of a sub-contractor are to a certain extent, measured by those of the original contractor. The foundation of the right of either to a lien is the original contract, and if that is not such as the statute contemplates, and cannot therefore, be made the basis of a lien in favor of the original contractor, a contractor under him is entitled to none. The original contract must be made with the owner of the land upon which the building is erected, or with some person authorized to act for him, and the resultant lien is co-extensive with his interest or claim in the property. An owner is one who has dominion over that which is the subject of the ownership. He has the right to make such use of it, consistent with the right of others, as he may see fit. The ownership may extend to the entire thing, or may be limited to an interest in it; but whatever is the subject of the ownership, it is held by the owner for his own individual benefit. For the purposes of the act, as assignable, transferable, or conveyable interest or claim in the thing constitutes ownership, but the right to assign, transfer, or convey resides in the person having the interest or claim, to be exercised at his pleasure, so that his relation to the interest or claim is that of "owner" under the general definition of the term. By the terms of the statute all school property within the district is held by the school board in trust for the school district, for the benefit of the school, and the school is a state institution. We do not think that either the school board or the school district is, within any definition of the term the "owner" of the school property; and, the provisions of the mechanics' lien law cannot be applied to public school buildings. But it does not follow that the lienor is without remedy. He has recovered a judgment against his immediate contractors. A school district is a quasi corporation, and not subject to process in garnishment; but if the board has money in its hands belonging to the contractors, and the lienor is unable to realize anything upon his judgment, the money can be reached by a proceeding in equity. A court of chancery will subject property and funds to the satisfaction of a judgment, when they cannot be reached by legal process, and the judgment cannot otherwise be satisfied.

Florman v. School Dist. No. 11 El Paso County, Court of Appeals of Colorado, 40 Pac. Rep. 469.

APPLICATION OF PAYMENT.—A contractor received money from one W., for whom he was building a house, and paid it to a material man, who had filed a lien against the house, and to whom the contractor was indebted on several accounts. At the time of

making the payment the contractor stated that he received the money from W., and that "I gave it to you on account." The material man applied it to an account other than that for materials furnished for W's house. It was held, that a claimant who had filed a subsequent lien against such house was not entitled to have the payment applied to the account for the materials furnished for W's house, merely because the money came from the owner.

Orr v. Nagle, Supreme Court, General Term, Second Department, 33 N. Y. Sup. Rep. 879.

A CONTRACTOR WHO HAS ABANDONED WORK.—A contractor who has abandoned work for which he contracted cannot recover on a quantum meruit for the part done by him unless the contract was rescinded, or its complete performance was rendered impossible by the wrongful conduct of the owner. The fact that the owner upon the statement of the contractor that his failure to prosecute the work was owing to his inability to get mechanics, employed extra men himself, does not show a recission of the contract by the owner nor cause for recission by the contractor.

McGonigle v. Klein, Court of Appeals of Colorado, 40 Pac. Rep. 465.

PERFORMANCE OF CONTRACT.—A contract to put a gravel roof on a building, to be done in first class shape, and guaranteed for a certain time, does not require the personal services of the contractor, so as to prevent his hiring another to do it under his supervision and instruction.

Curran v. Clifford, Court of Appeals of Colorado, 40 Pac. Rep. 477.

TO RECOVER FOR WORK DONE UNDER CONTRACT.—In an action to recover for work done under a contract, and for breach of the contract by the owner in preventing further performance, a report made to the contractor by his workmen that they had been stopped by the owner, accompanied by proof that they had been stopped by him, is competent to show the reason why the contractor ceased further performance of the contract.

Raven v. Smith, Supreme Court, General Term, Second Department, 33 N. Y. Sup. Rep. 972.

RESTRICTIONS IN DEED.—A restriction in a deed "that no building shall be placed at a less distance than twenty feet from the easterly line of the street" is violated by the erection, within the prohibited distance, of a piazza, eight feet wide, encircled by a railing, and having a roof supported by posts, attached to a house, and extending along its entire front.

Reardon v. Murphy, Supreme Judicial Court of Massachusetts, 40 N. E. Rep. 854.

IN AN ACTION ON A NOTE.—In an action on a note given by the owner of a building for materials furnished the contractor, in the absence of any warranty exacted from the material man when the note was given or other contract in regard to the materials, the Supreme court of Michigan holds, that the owner cannot recoup damages on the ground that the material furnished did not come up to the specifications in the building contract.

Delbridge, Brooks & Fisher Co. v. Patterson, 63 N. W. Rep. 436.

BUSINESS MOSAICS.

TYPEWRITING.—Save time and labor by dictating your contracts, specifications, etc., in shorthand to our stenographers free of charge. Sent to all parts of the city. Typewriting only five cents per folio of one hundred words. Additional copies two cents per folio. Pacific Copying Co., 10 Murphy Building, Telephone Jessie, 31.

Mrs. MORIARITY—"Oh, Moike, Moike, can't you spake to me?" Mr. Moriarity—"It's dead I am, darlint. I'm kilt entirely." Mrs. Moriarity—"And it's right glad I am to hear you say that same."—*Terre Haute Express.*

Joseph Budde manufacturer of sanitary appliances in the plumbing line, furnishes everything in this line that can be required to make our residences healthy and convenient; it will be well to remember in giving orders to Mr. Budde that you are patronizing home industry, and at the same time getting what you want of the most improved kind, at reasonable prices. His factory and show room is at 575 Mission street, San Francisco.

Harriet—"Let's play cleaning house, will you Henry?" Henry—"All right; you pound your fingers with the tack hammer, and I'll up set the stove pipe and say dammit."—*Society.*

A. Steiger Sons manufacturers of Architectural Terra Cotta, and almost everything in the way of stoneware, etc., have their San Francisco office at 320 Sansome street, San Francisco, San Jose address P. O. Box 1025.

Building Paper and Paraffine Paint are almost indispensible now days in making a house comfortable and lasting; you have an opportunity to patronize home industry, and add to your comfort at the same time by calling at 116 Battery street and leaving your orders.

"What were your husband's last words?" "He hadn't any," sobbed the widow, "I was with him."—*N. Y. Sun.*

Edward B. Hinds & Co., 411 Mission street, San Francisco continue to furnish Hill's Patent Inside Sliding Blinds, Perfection Window Screens, Self Coiling Burglar and fire-proof steel shutters, as well as rolling wood partitions. Send for catalogue and price list.

Mr. de Style—"Let's go to the theatre to-night." Mrs. de Style—"I have nothing to ware." Mr. de Style—"Then let's go to the opera."—*New York Weekly.*

If you want the most complete and safest patent chimney in the market get Clawson's at 1340 Market street, San Francisco.

"Was Washington a polished writer?" "Well, he used to knock the King's English silly."—*Life.*

Messrs. N. & G. Taylor Co., manufacturers of the "Taylor Old Style" brand of Roofing Tin, Philadelphia, are out in a neat advertisement. It is a four-leaf folder, on heavy paper, printed in two colors in attractive type. It is entitled "A Roofing Tin That Will Last as Long as the Building." They also devote a page to the "Secret in the Tinplate Trade," and go on to say that "The Secrets" in the Tinplate trade are in the producing of plates that appear other than what they are. The circular also states that their special brand "The Taylor Old Style," is the only plate made to-day exactly the same as in 1830, since which time it has never caused a complaint." To those interested in good Roofing Tin, we would suggest that they write to the N. & G. Taylor Co., Philadelphia, and secure samples and prices. This firm has always enjoyed the reputation of handling the best of goods.

His Piece—She—"I didn't hear anything of father's dog. He held his peace to-night, didn't he?" He (bitterly) "Yes; his piece of my $15 trowsers."—*Yale Record.*

Any of our readers interested in building a comfortable residence, should not fail to visit the show-room of the J. L. Mott Iron Works under the charge of Mr. M. S. James who is the Coast representative of the company.

To those not already posted it will prove a revelation to find what a fine display of goods that may well be called luxurious, every thing in the line of baths, wash tubs, foot baths, etc., with the latest improvements in the way of fitting will be found.

No excuse can be made for not having our houses properly provided for in this line, when we have on hand such a choice selection to choose from. Office and show rooms 27 Flood Building, third floor.

Clause Spreckels proposes to build a house out of sugar. That's nothing. We know a dairyman in Ohio who built several houses out of chalk and water.—*Toledo Bee.*

When a man decides upon improving his shop, factory or farm, by the addition of power, he naturally looks for something entirely up to date. He investigates, considers, and finally decides to buy an Ajax Coal Oil Gas Engine as meeting his requirements more fully, and being safer, than any other power obtainable. Palmer and Ray, San Francisco, Cal., the manufacturers of this engine, have earned the gratitude of the public by placing within its reach a reliable, economical power, that defies the restrictions of insurance companies. It is the latest and best.

Girl (weeping)—"I'm sorry you have to go on the road again. It almost breaks my heart." Drummer—"Don't cry, Fanny, I'll manage to pick up another girl somewhere."—*New Lettler.*

William Bateman manufacturer of wood mantels, interior finish and inlaid floors. Mr. Bateman gives particular attention to fitting up banks, offices, stores and steamboats, 411 Mission street between First and Fremont streets.

Cabot's Creosote Shingle Stains.—Since the introduction of these stains manufactured by Mr. Samuel Cabot, 70 Kilby street, Bostou, there has been great improvement in the looks of those houses that have what may be called an unrivaled article for the permanent improvement of the looks, as well as the lasting qualities, for by the use of this stain you do not require to repaint your building so often as is the case where the stain has not been used. Bell & Van Wyck are the agents of Samuel Cabot, their office is at 303 California street, San Francisco.

Briggs—"Sometimes I wish I could be a hermit, and not have to associate with my fellow men." Braggs—"You can get practically the same effect by eating onions."—*News Letter.*

Those in want of artificial stone work, would do well to call upon George Goodman, who makes a good sidewalk as well as every thing else in his line of business, his office is in the Nevada Block, 307 Montgomery street, San Francisco.

PEOPLE of the civilized world, who have the good of humanity at heart, are to-day earnstly engaged in studying the present condition of society with refererence to its probable effect on the future of civilization. It is admitted on ever side, that the existing condition of things could be improved on, and the pessamist thinks that if it is not improved on soon, that an industrialy revolution will surely result.

Every legislative body from town council to national senate is engaged in futile endeavors to so improve our laws that greater benefits may be conferred on a larger proportion of the public. At least that is what a long suffering public is supposed to believe. As a matter of fact, every legislative body, from Supervisors to Senators, is engaged in passing laws, giving special privileges to special classes. Corporations are granted control of our streets for railroads, gas and water and electric light purposes, etc., etc., while an astonishing mass of evidence is at hand to show the benefit that would result to the community, if public instead of private corporations should own and conduct these public utilities. Even the daily press occasionally publishes some of these striking facts, but is usually too timid to strongly advocate a sweeping reform. The old parties in national politics are still tinkering away at the rotten and corrupt legislation that has resulted from the election of petty politicians instead of broad and liberal statesmen; a legislation that surrenders the public money to private ownership, and even goes so far as to give to private banks the right that the Constitution of our United States refused to confide to any hands, save the national government alone.

As a small and local example of the influence of private interests acting against public policy, we can cite the attempts made in recent years to get proper building ordinances for the city of San Francisco.

The Fire Department has had the matter in hand for years. After much study and many consultations with the local Chapter of Architects, an ordinance was framed. We do not know that it is any secret, that private interests kept it from being acted on by the Supervisors for many month's. It is certainly no secret that private interests have prevented its becoming law. Now, in view of the fact, that private interests do as a matter of fact, direct, control and defeat beneficial legislation, is it any wonder that pessamists look with despondency on the future? That socialism is looked to by many as the only escape from present crushing conditions? And that reform parties are springing up on every side, each with new remedies to propose?

CITY HALL ENVIRONS.

AS an attempt will be made next legislature to permit the City to regain possession of its birthright, wrung from it during the first years of the building of its City Hall—that ground forming part of the old Yerba Buena graveyard lying between the City Hall and Market street—some practical way must be devised by which the City may now recoup itself for the prospective millions of dollars it threw away at that time, and which it will now have to pay to take possession again of the land.

If the present owners are allowed to build on these lots comprising this land the buildings 130 feet high—which there is no equitable way to prevent except by buying the property—the view of the whole south front of the Hall will be cut off except the little visible at the end of City Hall Square.

The *tout ensemble* or the altogether of the front will thus be nevermore seen of mortal man. This result looking at it from an artistic view is a result devoutly to be contemned. Therefore if there be any way by which the City Hall may yet be seen in its entirety and still the land facing on Market street be utilized; such a way is worthy of consideration and action.

Now an objection has always been made by business people that a break made in a business street by a park or recreation grounds, spoils the continuity of the line of stores and thus tends to prevent the side of the street on which this is from being favored as a shopping side. This may be so—and if so the solution of the question about to be offered does away with this objection.

The proposition is that the City acquire the whole of the property between the City Hall and Market street down to the corner of McAllister and build thereon a one-story market building—covering the whole ground with a glass roof. In this building can be housed, as many businesses as may be desirable—chiefly however would be those catering to the wants of the citizens in the eating line—butchers, greengrocers, fruiterers, fishmongers, dairy produce, etc., and restaurants. These businesses are always desirable for obvious reasons to be kept by themselves and to have no dwelling place over them.

This crystal palace devoted to the Art and Science of Gastronomy will be a striking feature to the City and at the same time will not prevent the whole effect of the City Hall from being taken in from the opposite side of Market street.

Now as to the financial part of the scheme whatever money necessary to be raised to pay for the land and for the erection of the building will be secured by the rents—the amount of which rents will be found amply sufficient to pay three per cent on the bonds, and at the same time no doubt provide a balance to help pay off the principal; with the satisfaction of knowing that at the end of that time a permanent income will be coming into the City.

W. J. CUTHBERTSON.

"Say, mamma, it's awful hard work fishin', ain't it?" "No, dear." "Then why does papa always have to stay in bed the next day and rest?"—*Truth.*

FOR RIGID BUILDING INSPECTION.

REAL estate men, especially the large and influential class that develops property by building, are more interested in investigations of recent collapses of unfinished buildings than would appear on the surface. The real estate board has on more than one occasion taken a decided stand in favor of licensing architects in a similar manner as members of the legal and medical professions must be licensed before they are permitted to practice. At present there are hundreds of contractors and builders, practical men perhaps, but no architects, who are permitted by the building department to erect, not only frame cottages, but quite pretentious flats and store buildings, upon the presentation of mere excuses for building plans. Frequently only the most primitive sketches are accepted, and the result must naturally be that many insecure buildings are erected.

In this connection, and referring to recent collapses of unfinished buildings in Chicago and New York, the *American Contractor* says that two things at least can be done, which, if they will not render future similar occurrences impossible, will at least make them highly improbable.

First, every city should have building inspectors who inspect. And the first requisite in securing such officers is that their appointment shall be absolutely taken out of the hands of the political machine. To make such a position as it now is, one of the spoils of office, says the paper cited, is as rediculous as it would be to have the office of schoolteacher dependent upon party reward for party influence. No, the building inspector, whose duty it is to see that every building in course of erection is built in full accordance with the ordinances regulating such matters, should be appointed by the executive for his experience and fitness for the office—appointed with the consent of the legislative branch, and when appointed hold his office as does the supreme judge, during life, or until he proves unworthy, and he should be subject only to the law.

* * *

Then, too, the law should throw its protecting barriers about the noble profession of architecture. Architects should be licensed, and no one allowed to design buildings unless he had previously shown to the satisfaction of the state that he thoroughly understands how to calculate strains and knows the strength of building materials.

In most States a doctor who has not thoroughly qualified himself by a course of study in some recognized college is not allowed to practice medicine. And, likewise, no architect should be permitted to design and superintend the erection of high buildings unless he had first qualified himself by a suitable course of study. A mere draughtsman or a carpenter who has made a study of attractive elevations is frequently developed into a full-fledged architect with an abundant line of clients. To diminish the risks to the public by restricting the work of such men of "a little education" is a curtailment of license and not of liberty.

When towns were small and one and two story buildings were the prevailing style it mattered little, but with growth of cities and the almost universal demand for taller buildings—for heavy warehouses of eight and ten stories; for flat buildings of six, seven, eight, or even ten and twelve stories, accommodating scores of families—the needs and responsibilities are multiplied, the attendant dangers quadrupled, and the necessity for public supervision and protection becomes imperative. With the planning of all such buildings exclusively in the hands of competent architects, responsible for the correctness of their figures and detail, and with competent inspectors, whose seal of proper construction, in accordance with plans and local building regulations, shall be a condition essential to the continuance of the work, the disgrace of such catastrophes as recently occurred will be avoided, or if they occur the blame can be readily placed where it belongs and the guilty parties can be held responsible.—*Chicago Times-Herald.*

LAMPS AND THEIR DANGERS.

FEW people realize the extent of the destruction and loss of life annually caused by lamp accidents. In 1893, in London alone, no less than forty-eight lives were lost by fires due to the explosion or upsetting of petroleum lamps. Last year the number was thirty-three, and the fire brigade were called to 418 fires due to the same cause, while the number of smaller fires to which the brigade were not called, and which were caused by lamp accidents, was probably between 1,500 and 2,000. During the past two months ten deaths have resulted in London from lamp accidents, or at the rate of sixty per annum. These figurs are for London only, with its almost universal gas supply. There are no reliable statistics for the country as a whole, but it is evident that the annual loss of life and destruction of property must be enormous.

About two-thirds of the accidents reported are due to the overturning of the lamp and the smashing of the reservoir, which is unfortunately usually made of glass or china. The other third are caused by explosions.

The conditions of explosion vary with almost every lamp, and with the "flash point" of oil used in it. As the oil sinks in the reservoir air is drawn in, and when the oil is warmed to a certain point it gives off inflamable vapour which mixes with the air. A small proportion of this vapour yields the *maximum* explosive force—when the air is saturated with the vapour, as happens generally by the the time the reservoir is nearly empty, the gases contained are highly inflamable, and will take fire almost like gunpowder if the lamp is smashed, but they are much less explosive. The gas may come up the sides of the wick and be ignited by the flame, or a draught caused by the opening of a door may blow the flame down into the reservoir or draw gas up towards the flame, or the wick may be turned too low and the lighted part pass inside.

The first, and by far the most important condition of a safety lamp, is that the reservoir should be of metal, and not of china, glass, or similar fragile metals.

Other conditions are, that the wick should be enclosed in a wick tube passing almost to the bottom of the reservoir, and so shutting off any possible communication between the air inside and the flame. Even if the lighted wick were turned down, and were to pass the tube still burning, it must be extinguished in the liquid oil at the bottom. The wick ought to fit the tube so that when the oil falls to the bottom no air will pass up the side of the wick.

One principal precaution necessary is, that the burner and wick tube should screw securely into the reservoir, so that they will not come apart in case of a fall. There are other matters, such as the provision of a broad base, so that the lamp may not be top-heavy; but the three suggestions named are by far the most important.—*The Citizen.*

A VERY CURIOUS TECHNICAL POINT.

A VERY curious technical point is to be decided by the Bureau of Yards and Docks of the Navy Department at Washington, and architects will be interested in the result. It seems from the newspaper accounts, that the Government is building a dry-dock at the Brooklyn Navy Yard, and a large number of piles are to be driven. The site of the dock is now under water, and the contractors, in order to get the piles down to the requisite depth, place "followers" on top of them, and, by driving the followers, push the submerged piles to the necessary depth. To this arrangement, however, the supervising engineer, Mr. Menocal, objects, and claims that the contractors should sheet-pile the ground, and pump out the water to a depth sufficient to allow the piles to be driven by direct blows to the depth intended. As the contractors do not wish to do this, and Mr. Menocal is not willing to accept piling driven with a follower, it has been agreed to refer the question to the Department officials.

The common impression among architects is certainly unfavorable to driving piles with a follower. According to the daily papers, Mr. Menocal considers that "the stability of the piling is jeopardized" by driving with a follower. What this means we will not attempt to say, but we presume that Mr. Menocal's real object is just that which any architect would make—that in driving piles with a follower, it is not only impossible to give as solid a blow as by direct impact of the hammer, but, owing to the varying rebound of the follower from the head of the pile, it is impossible to tell when piles so driven have reached the firm stratum to which it is commonly intended to drive them. As every one knows, the arrival of the foot of a pile at the bearing stratum is shown partly by the rebound of the hammer from the top of the pile, and partly, as well as more accurately, by the diminished distance to which it sinks under the blow. The sinking at the last blow is usually the most important factor in determining the load that the piles will bear safely, and it is of the utmost importance that it should be accurately measured. Where a follower is used, this essential measurement is rendered misleading. If it is measured, as is usually the case, at the hammer, all that can be shown is the decent of the follower. This may, owing to the crushing of its end, and of the corresponding end of the pile, be much greater than that of the pile itself; or, if the follower is elastic, and its top well "broomed up," a blow on its top followed by a lively rebound, may have a very significant effect in driving the pile below; so, that data drawn from the sinking of the follower are nearly worthless for estimating the resistance of the piles driven with them. Iron plates, with sockets on each side, are sometimes interposed between the pile and the follower, with advantage, and it is to be hoped that the official investigation will serve to elucidate all these points.—*American Architect and Building News.*

REPORT OF COMMITTEE ON "STRENGTH OF BRIDGE AND TRESTLE TIMBERS."

THE Committee appointed to report on "Strength of Bridge and Trestle Timbers, with special reference to Southern Yellow Pine, White Pine, Fir and Oak," desires to present herewith, as part of their report, the very valuable data, compiled by the Chairman of the Committee, relative to tests of the principal American bridge and trestle timbers

and the recommendations of the leading authorities on the subject of strength of timber during the last twenty-five years, embodied in the Appendix to this report and tabulated for easy reference in the accompanying tables I to IV.

The uncertainty of our knowledge relative to the strength of timber is clearly demonstrated after a perusal of this information, and emphasizes, better than long dissertations on the subject, the necessity for more extensive, thorough and reliable series of tests, conducted on a truly scientific basis, approximating as nearly as possible actual conditions encountered in practice.

The wide range of values recommended by the various recognized authorities is to be regretted, especially so when undue influence has been attributed by them in their deductions to isolated tests of small-sized specimens, not only limited in number, but especially defective in not having noted and recorded properly the exact species of each specimen tested, its origin, condition, quality, degree of seasoning, method of testing, etc.

The fact has been proved beyond dispute that small-size specimen tests give much larger average results than full-size tests, owing to the greater freedom of small selected test pieces from blemishes and imperfections and their being, as a rule, comparatively drier and better seasoned than full-size sticks. The exact increase, as shown by tests and by statements of different authorities, is from ten to over one hundred per cent.

Great credit is due to such investigators and experimenters as Professors G. Lanza, J. B. Johnson, H. T. Bovey, C. B. Wing, and Messrs. Onward Bates, W. H. Finley, C. B. Talbot, and others, for their experimental work and agitation in favor of full-size tests. Professor G. Lanza, R. H. Thurston and Wm. H. Burr have contributed valuable treatises on the subject of strength of timber. The extensive series of small and full-size U. S. Government tests, conducted in 1880 to 1882 at the Watertown Arsenal under Col. T. T. S. Laidley, and more recently the very elaborate and thorough timber tests being conducted by the U. S. Forestry Division under Dr. B. E. Fernow, Chief, and Prof. J. B. Johnson of Washington University, St. Louis, afford us to-day, in connection with the work of the above mentioned experimenters, our most reliable data from a practical standpoint.

The test data at hand and the summary criticisms of leading authorities seem to indicate the general correctness of the following conclusions:

First—Of all structural materials used for bridges and trestles, timber is the most variable as to the properties and strength of different pieces classed as belonging to the same species, hence imposible to establish close and reliable limits of strength for each species.

2d—The various names applied to one and the same species in different parts of the country lead to great confusion in classifying or applying results of tests.

3d—Variations in strength are generally directly proportional to the density or weight of timber.

4th—As a rule, a reduction of moisture is accompanied by an increase in strength; in other words, seasoned lumber is stronger than green lumber.

5th—Structures should be, in general, designed for the strength of green or moderately seasoned lumber of average quality and not for a high grade of well-seasoned material.

6th—Age or use do not destroy the strength of timber, unless decay or season-checking takes place.

7th—Timber, unlike materials of a more homogeneous nature, as iron and steel, has no well-defined limit of elasticity. As a rule, it can be strained very near to the breaking point without serious injury, which accounts for the continuous use of many timber structures with the material strained far beyond the usually accepted safe limits. On the other hand sudden and frequently inexplicable failures of individual sticks at very low limits are liable to occur.

8th—Knots, even when sound and tight, are one of the most objectionable features of timber, both for beams and struts. The full-size tests of every experimenter have demonstrated, not only that beams break at knots, but that invariably timber struts will fail at a knot or owing to the proximity of a knot, by reducing the effective area of the stick and causing curly and cross-grained fibers, thus exploding the old practical view that sound and tight knots are not detrimental to timber in compression.

9th—Excepting in top logs of a tree or very small and young timber, the heart-wood is, as a rule, not as strong as the material farther away from the heart. This becomes more generally apparent, in practice, in large sticks with considerable heart-wood cut from old trees in which the heart has begun to decay or been wind-shaken. Beams cut from such material frequently season-check along middle of beam and fail by longitudinal shearing.

10th—Top logs are not as strong as butt-logs, provided the latter have sound timber.

11th—The results of compression tests are more uniform and vary less for one species of timber than any other kind of test; hence, if only one kind of test can be made, it would seem that a compressive test will furnish the most reliable comparative results.

12th—Long timber columns generally fail by lateral deflection or "buckling" when the length exceeds the least cross-sectional dimension of the stick by twenty, in other words the column is longer than twenty diameters. In practice the unit stress for all columns over fifteen diameters should be reduced in accordance with the various rules and formulæ established for long columns.

13th—Uneven end-bearings and eccentric loading of columns produce more serious disturbances than usually assumed.

14th—The tests of full-size long compound columns, composed of several sticks bolted and fastened together at intervals, show essentially the same ultimate unit resistance for the compound column as each component stick would have, if considered as a column by itself.

15th—More attention should be given in practice to the proper proportioning of bearing areas, in other words the compressive bearing resistance of timber with and across grain, especially the latter, owing to the tendency of an excessive crushing stress across grain to indent the timber, thereby destroying the fiber and increasing the liability to speedy decay, especially when exposed to the weather and the continual working produced by moving loads.

The aim of your Committee has been to examine the conflicting test data at hand, attributing the proper degree of importance to the various results and recommendations, and then to establish a set of units that can be accepted as fair average values, as far as known to-day, for the ordinary quality of each species of timber and corresponding to the usual conditions and sizes of timbers encountered in practice. The difficulties of executing such a task successfully

cannot be overrated, owing to the meagreness and frequently the indefiniteness of the available test data, and especially the great range of physical properties in different sticks of the same general species, not only due to the locality where it is grown, but also to the condition of the timber as regards the percentage of moisture, degree of seasoning, physical characteristics, grain, texture, proportion of hard and soft fibers, presence of knots, etc., all of which affect the question of strength.

Your Committee recommends, upon the basis of the test data at hand at the present time, the average units for the Ultimate Breaking Stresses of the principal timbers used in bridge and trestle constructions shown in the accompanying table.

Average Safe Allowable Working Unit Stresses in Pounds per Square Inch.

Recommended by the Committee on "Strength of Bridge and Trestle Timbers."

American Association of Railway Superintendents, Bridges and Buildings. 5th Annual Convention, New Orleans, October, 1895.

KIND OF TIMBER.	Tension.		Compression. With Grain.		Compression.	Transverse Rupture.		Shearing.

Hemlock	6000			4000	600	3500	900000	350	2500
Cypress	6000		6000	4000	700	5000	900000		
Cedar	8000		6000	4000	700	5000	700000		1500
Chestnut	9000			5000	900	5000	1000000	600	1500
California Redwood	7000			4000	800	4500	700000	400	
California Spruce				4000		5000	1200000		

In addition to the units given in the table, attention should be called to the latest formulæ for long timber columns, mentioned more particularly in the Appendix to this report, which formulæ are based upon the results of the more recent full-size timber column tests and hence should be considered more valuable than the older formulæ derived from a limited number of small-size tests. These new formulæ are Professor Burr's, App. I.; Professor Ely's App. J.; Professor Stanwood's, App. K.; and A. L. Johnson's, App. V.; while C. Shaler Smith's formulæ will be better understood after examining the explanatory notes contained in App. L.

Attention should also be called to the necessity of examining the resistance of a beam to longitudinal shearing along the neutral axis, as beams under transverse loading frequently fail by longitudinal shearing in place of transverse rupture.

In addition to the Ultimate Breaking Unit Stress the designer of a timber structure has to establish the Safe Allowable Unit Stress for the species of timber to be used. This will vary for each particular class of structures and individual conditions. The selection of the proper "Factor-of-Safety" is largely a question of personal judgment and experience, and offers the best opportunity for the display of analytical and practical ability on the part of the designer. It is difficult to give specific rules. The following are some of the controlling questions to be considered.

The class of structure, whether temporary or permanent, and the nature of the loading, whether dead or alive. If live, then whether the application of the load is accompanied by severe dynamic shocks and pounding of the structure. Whether the assumed loading for calculations is the absolute maximum rarely to be applied in practice or a possibility that may frequently take place. Prolonged heavy steady loading and also alternate tensile and compressive stresses in the same piece will call for lower averages. Information as to whether the assumed breaking stresses are based on full-size or small-size tests or only on interpolated values, averaged from tests of similar species of timber, is valuable in order to attribute the proper degree of importance to recommended average values. The class of timber to be used and its condition and quality. Finally the particular kind of strain the stick is to be subjected to and its position in the structure with regard to its importance and the possible damage that might be caused by its failure.

In order to present something definite on this subject, your Committee presents the accompanying table showing the Average Safe Allowable Working Unit Stresses for the principal bridge and trestle timbers, prepared to meet the average conditions existing in railroad timber structures, the units being based upon the ultimate breaking unit stresses recommended by your Committee and the following factors-of-safety, viz.:—

Tension, with and across grain	Ten
Compression, with grain	Five
" across grain	Four
Transverse Rupture, Extreme Fiber Stress	Six
" " Modulus of Elasticity	Two
Shearing, with and across grain	Four

In conclusion your Committee desires to emphasize the importance and great value to the railroad companies of the country of the experimental work on the strength of American timbers being conducted by the Forestry Division of the U. S. Department of Agriculture and to suggest that the American Association of Railway Superintendents of Bridges and Buildings endorse this view by official action and lend its aid in every way possible to encourage the vigorous continuance of this series of government tests, which bids fair to become the most reliable and useful work

on the subject of strength of American timbers ever undertaken. With additional and reliable information on this subject far reaching economies in the designing of timber structures can be introduced, resulting not only in a great pecuniary saving to the railroad companies, but also offering a partial check to the enormous comsumption of timber and the gradual diminution of our structural timber supply.

The statements rest upon official reports and returns of municipal officers.

THE ASSOCIATION OF RAILWAY SUPERINTENDENTS OF BRIDGES AND BUILDINGS.

RESOLUTION ADOPTED BY THE ASSOCIATION AT THE FIFTH ANNUAL CONVENTION AT NEW ORLEANS, OCTOBER 15, 1895.

WHEREAS a most comprehensive and valuable series of investigations into the properties of wood and tests of the strength of our commercial timbers have been carried on in the Division of Forestry of the U. S. Department of Agriculture.

WHEREAS these investigations have already demonstrated that a most decided improvement in the practice with timber structures and use of wood and a saving of millions of dollars' worth of wood material are attainable as a result of these investigations.

BE IT RESOLVED, that we, the American International Association of Railway Superintendents of Bridges and Buildings, assembled in regular session, at our Fifth Annual Convention at New Orleans, La., October 15, 1895, endorse, as railroad officials in charge of the construction and maintenance of timber structures and buildings of railroads throughout the United States, the work thus inaugurated by the U. S. Government as tending towards a most needful and rational economy of our forest resourses and desirable improvements in their use, resulting not only in a great saving to users of timber throughout the Country, but especially offering a valuable guarantee for the absolute safety of properly designed timber structures;

RESOLVED, further, that we ask our Representatives in Congress to make liberal appropriations for the continuance and more rapid advance of this work, in order to secure, as quickly as possible, the much needed information, believing that the Government alone is in a position to secure it and that it is true economy to provide it without delay;

RESOLVED, further, that these resolutions be transmitted to the President of the Senate, the Speaker of the House of Representatives, the Secretary of Agriculture, the Chairman of the Committee on Agriculture of the Senate, and the Chairman of the Committee on Agriculture of the House of Representatives.

AN APT SIMILE.

WHEN a firm stops advertising people get the idea they have discontinued business. If the pier of a bridge is to be built in the middle of a river, the builders commence by sinking stones for the foundation. If they drop the first stone and quit because they should not see it, the pier would never be built. If they dropped a dozen stones, one on top of the other, and quit before the pier was big enough to stick out of the water, they would lose their time and stones. But if they go on, put in a good solid foundation and build up from that, they will in time raise a pier that will be strong and permanent and that will hold up a useful and necessary bridge. It is just so with advertising. The first advertisement you drop in only serves as a foundation: they do not amount to anything if you do not drop in enough of them, but if you keep on piling one top of the other, in the end you will have a pier which will sustain the bridge of business all the rest of your life.—*Granite Producer and Builder.*

DEMOLITION OF AN ANCIENT LONDON HOSTELRY.

AT London, England, workmen commenced pulling down the famous old "Goose and Gridiron," St. Paul's churchyard, which was built directly after the Great Fire. While Sir Christopher Wren was superintending the erection of St. Paul's Cathedral, the St. Paul's Freemason's Lodge, of which he was Master, used to meet in this house. Within an upper room the great architect presided over the meetings of the lodge for a period of eighteen years. There he presented to his brethren three mahogany candlesticks, also the trowel and mallet that he used when he laid the foundation-stone of the cathedral in 1675. The site of the "Goose and Gridiron" was, before the fire, occupied by the "Mitre" Tavern, the first London music house. For a good while the "Goose and Gridiron" has been closed. The building to be erected on the site will form part of the warehouse of Messrs. Hitchcock & Williams.—*The Citizen.*

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.
SETH BABSON, Pres. — W. P. MOORE, Vice-Pres.
OLIVER EVERETT, Sec. — JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
OCTAVIUS MORGAN, PRES. — A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec't. — AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. — GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. — W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. — C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. — H. T. BESTOR, Treas.

TWENTY-NINTH ANNUAL CONVENTION OF THE AMERICAN INSTITUTE OF ARCHITECTS.

IF the architects of this country could only manage to construct their buildings with the same degree of skill and polish with which Mayor Walbridge built his words and phrases into one of the neatest little speeches of welcome we have ever listened to, he could not say, as he did, that just as we Americans have no language, having borrowed it from other peoples, so we have no architecture, having borrowed from other races the styles they had invented. The analogy he established between language and architecture was a very welcome variant upon the ordinary comparison at such times with "frozen music." The Mayor's felicitous remarks and the courtesy of Professor Ives, the Director of the Museum of Fine Arts, made the closing of the first day of the Twenty-ninth Annual Convention of the American Institute of Architects at St. Louis really memorable.

As for what preceded it, it is hard to escape asking the questions: "Is this sort of thing worth really while? What does it all amount to after all? Can a machine that needs so much oiling to prevent friction be properly designed? Can it ever do the work it was intended to accomplish?" While the coalition of the American Institute of Architects with the Western Associaton of Architects, six years ago, was beyond dispute a wise measure, it is also pretty certain that a grave mistake was made at that time in abolishing the distinction that had thitherto obtained in the Institute between Fellows and Associates.

As the Western Association had but one grade of membership, it was impossible that they could be expected to join the Institute as members of the Institute's lower grade, and it was equally nujust that they should all become members of the higher grade over the heads of the Institute members of Associate rank. The only solution was to put all members at the time of the coalition upon an equal footing, and the grade of Associate had to be abolished.

But the need was a temporary one. The coalition has been made; all members of the Institute are now of the same grade and yet they are far from happy, and the cause of their unhappiness, apparently, is that there is too much equality, seeing that the equality is one of name, while the inequality of artistic and intellectual capacity is still conspicuous and as galling to natures of one kind as it is hampering to natures of another kind.

There is a very prounced feeling that the Institue is not that body of *eletes* that it should be, that all the members would like it to be and which can only do good work when it has become such. Yet, all the same, it is a very excellent body, doing useful work and likely to do better as time goes on, for in a civilized and progressive world all things ameliorate, and the very friction that now requires such profuse application of oil is polishing off the offensive crudities that offend the higher sensibilities.

There is no need of resorting to the violent and reactionary measures that some members appear to be dimly hinting at. The cure, or at least, a real and permanent palliative is within reach, and is seemingly a simple one. The feeling that the Institute, as now constituted, is too democratic, or at least, not sufficiently aristocratic, is a natural and healthy one, since it betokens aspiration after higher and better things. If, as is certainly the case, it is felt to be a wrong that the newly-elected youthful practitioner should hold the same rank, so far as the public is advised, with the leaders of the profession of double his years and quadruple his professional experience, things can be set right and information conveyed to the public through the very simple measure of restoring the two grades of membership, Fellowship and Associateship.

In such event, where all would like to be Fellows, while most must remain Associates, how can the separation be effected? Very simply, and by the thoroughly democratic method of selection by ballot.

If it could be arranged that one-quarter or one-fifth of the present members who received the highest number of votes should be advanced to a higher grade, something would have been gained which would have a definite meaning to the public and a real value to the Institute and the profession at large. Having taken this step, the next would be to establish the regulation of the method of examination by which those members of the second grade could obtain entrance to the first rank, and with this would be secured the further great gain that whatever may really have been the qualifications and attainments of that portion of the first grade who obtained the rank through the suffrage of their fellows, those who were advanced later certainly did possess a definite and established professional capacity, and those men of real ability who now refrain from joining the Institute because of its, to their thinking, too democratic composition, could no longer plead their unwillingness to endure its leveling tendencies.

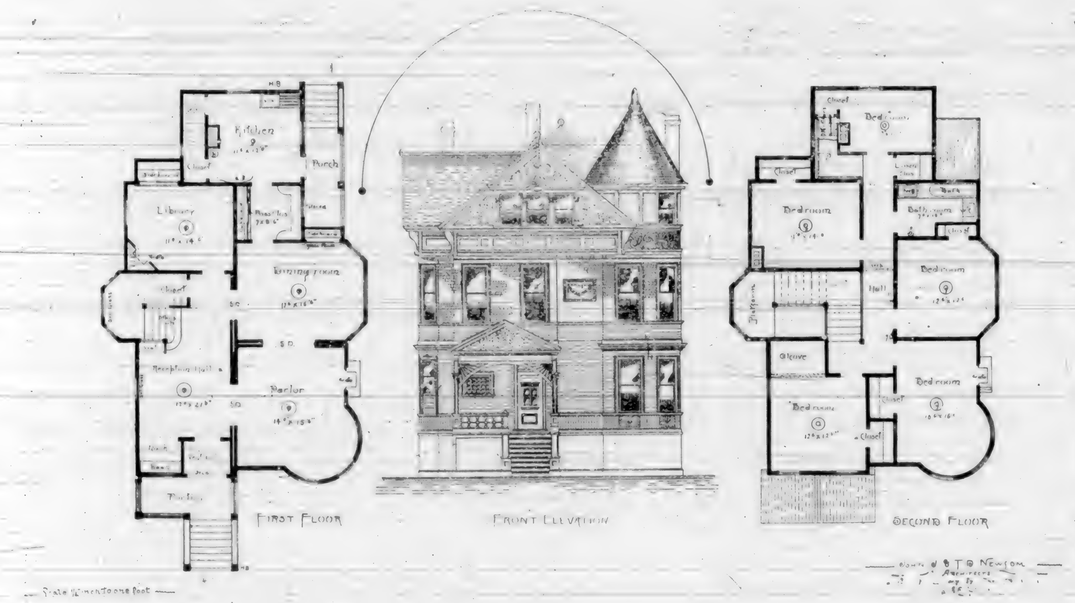
Some such change as this appears to be the way to meet and overcome the feeling of dissatisfaction that seems to be in the air, and a change like this can be adopted more easily and more safely than the more radical ones that some members would like to see enforced.

Although but little was actually said on the subject, yet all through the discussion, during the first morning session

of the matter of amending the by-laws, more than one debater tried to interject it, but the discussion was by the strict ruling of the chairman kept from wondering from the point, and the noon lunch gave time for that informal interchange of views that has so often saved the situation.

As to the amendments to the by-laws, these amounted practically to rescinding the action taken at the last convention, which seemed to restrict the freedom of action of the Chapters. Mr. Kendel, acting as spokesman of the Directors, explained that the action of the last convention had not been intended to restrict, but actually to enlarge the powers of the Chapters, but that since the measure had been generally misunderstood it was evident that, if nothing else was the matter, the language of the obnoxious by-laws was obscure and misleading. He therefore brought forward a series of amendments to Section X of the by-laws which, after prolonged debate and some opposition, were finally adopted.

(To be Continued.)



SAN FRANCISCO CEMETERIES.

SAN FRANCISCO is said to be suffering from its cemeteries, which are, as it happens, now placed on hills, to the windward of the main portion of the city, in such a position that the trade-winds from the Pacific, which blow for two months of the year, bring down among the living whatever miasm may rise from the sepulchres of the dead. A large school-house, situated near one of the cemeteries, was recently closed, on account of the repeated outbreaks of diphtheria among the pupils, and some of the physicians of the city attribute these as well as the other troubles from zymotic diseases, to the air from the graveyards. We do not remember having heard diphtheria before attributed to cemetery exhalations, but it is quite possible that it might be caused by them, and the people of the city are quite justified in urging, as they are now doing, the prohibition of further interments within the city limits, and even the removal of the bodies from the cemeteries already existing. Although the latter would be a rather serious undertaking, it is not likely that diphtheria will diminish much until it is accomplished. Few people have any idea of the time during which noxious and corrupting substances, buried in the ground beyond the reach of the nitrifying microbe, will continue to saturate the earth, and the surrounding atmosphere, with foul vapors. It is commonly assumed that within a few months, or a few years, at the utmost, the products of decomposition are absorbed by the soil, and converted into harmless inorganic substances; but Professor Lanciani tells us that under his direction, trenches were dug in the gardens of Mæcenas, which were made about the year 40 B. C. by filling in twenty-five feet of clean soil over an old cemetery on the Esquiline hill in Rome. The cemetery had long been a nuisance and danger to that part of the city, and Mæcenas earned the gratitude of his contemporaries by buying it and covering it up. Nevertheless, after two thousand years of disuse and exposure to such purification as a good coverifig of clean soil could effect in it, Lanciani found it necessary, when his men had reached the bottom of the earth-filling, and exposed the ancient surface, to relieve them at short intervals, in order that they might escape suffocation from the horrible stench which proceeded from the remains of the people whose bodies were laid there long before the Christian era.—*American Architect and Building News.*

BOOKS AND PERIODICALS.

"In Sight of the Goddess" is the complete novel in the LIPPINCOTTS' MAGAZINE for November. This novel by Harriet Riddle Davis will compare favorably with the many that have been published in this magazine. The table of contents contains an interesting variety of articles, among others "The Pet Meanness" which contains more truth than poetry and cannot be read without a smile.

CALIFORNIA GOLD MILL PRACTICES by Ed. B. Preston, M. E., issued in Bulletin No. 6 by the State Mining Bureau by J. J. Crawford, State Mineralogist.

Much valuable information is given not only in regard to improved machinery now in use at the mines, but to the manipulation of the ore or rocks from which gold is obtained. Mr. Crawford says that any citizen of this State may obtain a copy free by sending three cents for postage with their application, to the California State Mining Bureau, No. 24 Fourth street, San Francisco. The price to those living out of the State is fifty cents.

THE AMERICAN ARCHITECT AND BUILDING NEWS for October 26th, contains an interesting article entitled "Suggestions by Which a Greater Influence May be Exercised by the Institute Among the Architects of the South West, at the Same Time the Elevation of the Profession Before the Public" being a paper by Mr. James B. Cook, F. A. I. A. of Memphis, Tenn., read at the Twenty-Ninth Convention of the American Institute of Architects, held at St. Louis, Mo., Oct. 15th and 17th, 1895. The length of the article prevents our giving it in full, but members of the Institute, and architects in general will find it well worthy of their serious consideration.

Two articles in the FORTNIGHTLY REVIEW for October, 1895, show the great interest now taken in improvements of both the Army and Navy, the one by Major Arthur Griffiths entitled "Advancement in the Army," the other by W. Laird Clowes "The Naval Manœuvres." These two articles taken in connection with another "The Foreign Policy of England" shows the unsettled feeling of the people on the other side of the Altantic. A general desire to be prepared for the worst as well as a dread of what that may be.

The ever welcome Monthly Magazine INDUSTRY for November, 1895, is on our desk containing a very interesting table of contents. The article on "The Modern Gas Engine" will be a surprise to many who have only perfunctory knowledge of that useful little engine, and look upon it as well enough in its way. "Compressed Air for Street Railways" will have an interest for all who ride in the street cars, and that includes all of our community. To those not acquainted with this magazine, it will be a surprize to find so much information of a useful and interesting nature condensed with in its covers. Published by the Industral Publishing Company, 40 California street, San Francisco.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

CONSTRUCTION OF CONTRACT.—Whether a sum named in a contract is to be regarded as liquidated damages or as a penalty depends on the intention of the parties as it appears from the nature of the contract, the situation of the parties, and surrounding circumstances, and not merely on the language of the contract.

Sanford v. First National Bank of Belle Plaine, Supreme Court of Iowa, 63 N. W. Rep. 459.

A BUILDING CONTRACT CONTAINS THE FOLLOWING PROVISIONS:—"The contractors shall not make a claim for additional work, unless the same shall be done in pursuance of an order from the architects, and notice of all claims shall be made to the architects, in writing, within ten days of the beginning of such work." The Supreme Court of Minnesota held, that this provision is not effectual limitation upon the legal competency of the parties to the contracts, or their authorized agents, to modify or waive any of the contract, except in the particular manner stipulated.

Michaud v. McGaegor, 63 N. W. Rep. 479.

SET OFF FOR BREACH OF CONTRACT.—Where, upon default of the contractor, the architect, acting for the owner, let to the lowest bidder the contract for the completion of a building, the owner was entitled to set off against the original contractor or any subcontractor the actual amount paid for the completion of the work.

Yeomans v. Parker, Supreme Court of Michigan, 63 N. W. Rep. 346.

LIABILITY FOR INJURY TO EMPLOYE.—The foreman of a bridge gang and a mechanic working under his superintendence are not fellow servants, and the employer is liable for the negligence of the former whereby the latter is injured.

San Antonio & A. P. Ry. Co. v. McDonald, Court of Civil Appeals of Texas, 31 S. W. Rep. 72.

VERIFICATION OF MECHANICS' LIENS.—Chapter seventy-five of the Code creates the mechanics' lien in certain cases, on certain conditions; and section four of such chapter, among other things, provides that such account, to be effectually filed for record as a lien, must be sworn to by the person claiming the lien, or by some person on his behalf. Such oath is an element essential to the creation of the lien, and to the effectual, must be in writing, as a part, in some way, of the writing filed for record. If such affidavit be made before any officer of another state or country, it is not duly authenticated for record until it is subscribed by such officer, and there be annexed to it a certificate of the clerk or other officer of a court of record of such state or country, under an official seal, verifying the genuineness of the signature of the first mentioned officer, and his authority to administer an oath.

Buckhead v. Berkeley Springs Waterworks & Improvement Co., Supreme Court of Appeals of West Virginia, 21 S. E. Rep. 1031.

SUFFICIENCY OF VERIFICATION.—A verification of a mechanics' lien which states that affiant knows the contents thereof, and believes the same to be "true," is not invalidated by the use of the word "true" instead of "just," as provided by statute. A verification of a claim of mechanics' lien is not invalid because it refers to such claim of lien as "the foregoing lien." A lien claim which states that the contractor entered into an oral contract with claimant to furnish materials for the construction of said building, and that, in accordance with said contract, claimant furnished the material described, sufficiently shows to whom the materials were furnished.

Sautter v. McDonald, Supreme Court of Washington, 40 Pac. Rep. 418.

PATROL EVIDENCE IN THE INTERPRETATION OF CONTRACTS.—In arriving at the real intention of the parties, as shown by the language employed by them in a contract, and in order to make a correct application of the terms used to the subject-matter and objects referred to, when the same are not clearly expressed, the situation of the parties, and the surrounding circumstances may be considered in construing the contract, but it must be borne in mind that it is the language of the contract itself that is to be construed, and when the parties reduce their agreement to writing no other language employed by them in making the contract can be resorted to, except that furnished by the instrument itself.

Robinson v. Hyer, Supreme Ct. Fla., 17 Se. Reporter, 745.

BUSINESS MOSAICS.

If there is an architect in the city who is not a subscriber to the CALIFORNIA ARCHITECT AND BUILDING NEWS now is the time to correct the mistake, walk up to the office, 408 California street, room 17; hand in your name for the coming year you will be allowed November and December numbers without charge if you subscribe at once.

"There is certainly a strong odor of tobacco. Does that policeman smoke?" "I don't know, mum; he only died last week."—*Life.*

For facts about Paints, see the advertisement of W. P. Fuller & Co., on the outside cover of this journal. As every good housekeeper is anxious about the walls of her house, she should make a point of finding out the merits of **Duresco,** the new wall finish, or Washable Water Color.

"No, Willie, dear," said mamma, "no more cakes tonight. Don't you know you cannot sleep on a full stomach?" "Well," replied Willie, "I can sleep on my back."—*Harper's Round Table.*

A. Steiger Son's.—Architectural Terra Cotta can be supplied in any quantity, as well as every thing in their line. Call at 206 Market street, and be convinced of the truth of this statement. If you have not time to call, remember their telephone, Main, No. 5393.

Miss Yearsy—Do you think a woman ought to work for a husband? MISS QUICK—Yes, till she gets him.—*Melbourne Meekly Times.*

If we judge by the increasing amount of concrete work now being done in the city we should think the firm of W. R. Grace & Co., 203 California street, must be keep busy to supply the demand of Portland cements. As this well known firm always have the best brands in the market on hand it is no wonder their sales are large.

"Where is the man who keeps the restaurant?" said the disgusted customer. "He's gone out to lunch," replied the cashier.—*Town and Country Journal.*

The Gas Stove Department of the San Francisco Gas Light Co., has been the means of producing comfort and health to many a housekeeper of this city. Until the lady of the house has made the experiment of cooking by gas, she had no idea of the saving of time, health and temper which the use of gas for this purpose can accomplish. In fact making housekeeping a pleasure instead of a burden. We notice in most of the new houses in Richmond the gas grate for heating, as well as the gas stove for cooking, are almost universal. Call at 226 Post street and find out all about it.

Smith & Young, 723 Market street, San Francisco, and 230 South Spring street, Los Angeles, keep always on hand an endless supply of Building Materials. If you don't see what you want, ask for it, and you will hardly ever be disappointed.

Hungerford—Do you believe, Doctor, that the use of tobacco tends to shorten a man's days? DR. POWELL—I know that it does. I tried to stop it once, and the days were about ninety hours long.—*Truth.*

A. Zellerback & Sons, 419 and 421 Clay street, is the place to go if you want anything in the paper line; this Journal would use nothing but paper furnished by them. An endless variety may be found at their warehouses from which all wants can be supplied.

Joseph Budde, the successor of Wm. Smith, late of 21 Montgomery street, can be found at his present headquarters, 575 Mission street.

It should be remembered in giving your orders for sanitary appliances to Mr. Budde, you are not only doing what you wish others to do to you, but you are patronizing home industry.

The factory and show room of Mr. Budde are always open to the public, and thus people can be convinced they get what they pay for.

"That whiskey is fifteen years old. I know it because I've had it that long myself." THE COLONEL—By jove! sir, you must be a man of phenomenal self-control.—*Life.*

Architectural and Ornamental Iron work is a special feature of the Vulcane Iron Works, 135–145 Fremont street, San Francisco. A horse housed in a stable fitted with their stable fixtures would think he was in a Prince's stable.

It is better to risk the fire than to stay in the frying-pan.—*Life.*

Mr. Samuel Kellett, manufacturer of Plaster Decorations, plaster repaired and whitened at 28 Ellis street, San Francisco, and 375 Twelfth street, Oakland.

"Do you think you can make a good portrait of me?" "I'm afraid I must answer in the negative."—*Ex.*

If you need water only when the wind blows, if you are satisfied to utilize but a small fraction of the water in your well; if you prefer heavy bills for repairs after each storm in winter, by all means use a windmill; but if you want water at any time, and up to the full capacity of your well, put in the Ajax Coal Oil Gas Engine, the latest thing in mechanics, an engine that uses common coal oil for fuel, and is built by the well known firm of Palmer & Rey, San Francisco, Cal.

W. W. Montague & Co., have always on hand a selection of Mantels, Grates and Tiles that is sure to suit the most exacting, to say nothing of their fire place trimmings, and heating apparatus, either by warn air, hot water or steam.

It would take too much space to enumerate all the good things this firm carry in stock, but we may add the Artistic Bronzes must be seen to be fully appreciated.

She—I regret to say that our engagement is at an end. Here is your ring. HE—Then you do not love me? SHE—That is not the question. My husband is coming to take me home to-morrow.—*Pick-Me-Up.*

Before you decide upon what Door Hanger to select, call upon Dunham, Carrigan & Hayden Co., 17–19 Beale street, San Francisco. They claim the American sliding door hanger will cause a great saving of time and expense. See illustration in our advertising columns, page IX.

The thin one—I'd like to see one of those bicycle fiends dare to run over me. THE PLUMP ONE—No fear of that, dear. There would be to much risk of a punctured tire.—*Indianapolis Journal.*

Patronize Home Industry, and at the same time supply yourself with the best building paper on the market. Remember this is a California production entirely, and that there is none "just as good." For sale at 115 Battery street, and by dealers in general. The Paraffine Paint Co., with their well known mark of P. & B., keep in the front rank all the time.

Mowler—I see that some philosophers says that the way to cure yourself of a love affair, is to run away. Do you believe it? CYNACUS—Certainly—if you run away with the girl.—*Truth.*

The San Francisco Lumber Co., who do both a wholesale and retail trade, have their principal office at the foot of Third street. Telephone, Main, 1042. Their yards at the foot of Third street as well as the south side of Channel street, between Fourth and Fifth streets, are supplied with the lumber that you are sure to want.

To those who have examined the show rooms of the J. L. Mott Iron Works, under the charge of Mr. M. S. James, 27 Flood Building we have nothing to say, as actions speak louder than words, and to see is to be convinced, but to those who have neglected the opportunity now presented by Mr. James of seeing the finest selection of bathing utensils in the city, we would say go at once and be convinced that Mr. James can furnish you with what will make your house a joy for ever.

Mrs. Hicks—I thought you seemed to agree pretty well with Mr. Thirdly's sermon this morning. MR. HICKS—How so? MRS. HICKS—You nodded to about everything he said.—*Ex.*

The Revere Rubber Co., 527 Market street, San Francisco are the manufacturers of "Schenck" Swinging Hose Reel. As the use of this Reel reduces your insurance, this alone should make it an object to obtain what is considered by good judges the best in the market. The reason why this is so may be seen in the fact that it is guaranteed to work under any pressure as it has packing boxes that never leak. In fact as it is claimed by the manufacturers in their advertisement on page iv of this journal it is safe, reliable, non-corrosive, simple, durable, ornamental and always ready. What more can be asked?

"If a boy and a-half ate a green apple and a-half in a minute and a-hlf, how would he feel in an hour and a-half?" "Why doubled in half, of course; ask us something harder next time."—*Fun.*

The San Francisco Gas Light Co., have their Gas Stove department at 225 Post street. If ladies who have not done their cooking upon a Gas Stove, will call at this number on Post street, they will be convinced of the comfort, convenience and economy that will follow the purchase and use of a Gas Stove.

In several instances, where this advice has been acted upon, we know the result has been highly satisfactory.

"Have your smoked that cigar I gave you?" "No; the doctor says I mustn't take any violent exercise."—*Life.*

CITY BUILDING NEWS.

Andover and Eugenia. Additions; contractor, W. Kirshbaum; raising, etc., A. T. Penebsky; cost $1000.

Arlington near Roanoke. Frame cottage; owner, J. M. Mello; contractor, Louis Cereghino; signed, Oct. 10; filed, Oct. 10; cost $737.

Broadway near Fillmore. Plumbing, gas fixtures, etc.; owner, Mrs. Fannie Field; architect, M. J. Lyon; contractors, Ickelheimer Bro.; signed, Oct. 14; filed, Oct. 15; cost $775.

Broadway and Buchanan. Granite steps, fence, posts, etc.; owner, Annie Donahue; architect, A. Page Brown; contractor, A. McLennan; signed, Oct. 30; filed, Nov. 4; cost $3575.

Bush and Jones. Converting six flats into hotel; owner, E. A. Benteling; architects, Hermann & Swain; contractor, R. J. Pavert; signed, Oct. 16; filed, Oct. 16; cost $7846.

Bush near Laguna. To build; owner, Michael McGrath; architect, M. J. Welsh; contractor, J. W. Coburn; signed, Oct. 2; filed, Oct. 22; cost $3600.

Cherubusco near Cortland Ave. One-story frame; owners, Margaret and Edward Fekey; architect, Vincent Krolow; contractor, L. B. Schmid; signed, Oct. 4; filed, Oct. 5; cost $1675.

Clay near Van Ness. One-story banquet room, cabinet work excepted; owner, F. Schwabacker; architects, Percy & Hamilton; contractors, Farrell & Bell; signed, Oct. 22; filed, Oct. 22; cost $4100.

Clay near Stockton. Three-story brick; owner, Pacific Fruit Co.; days work; cost $10,000.

Clay near Drumm. Grading, concrete and brickwork for two-story brick; owners, G. H. and Alvina Lucksinger, et; architect, H. Geilfuss; contractor, F. Wagner; signed, Oct. 22; filed, Oct. 23; cost $1839.

Clay near Drumm. Pilling, foundation, etc; owner, G. H. and Alvina Lucksinger and others; architect, H. Geilfuss; contractors, Thomas Day & Sons; signed, Oct. 22; filed, Oct. 23; cost $3278.

Clayton near Waller. Two-story frame; owner, T. J. & Anne Sheehan; contractor, D. Ross; signed, Oct. 18; filed, Oct. 19; cost $3296.

Devisadero and Post. Plastering, etc.; owner, John W. McDonald; architects, Havens & Toepke; contractors, Clark & Kelley; signed, Oct. 29; filed, Nov. 2; cost $1300.

Eleventh Ave. near L. street. Alterations and additions; owner, Eugene Legallet; architect, E. Deplerre; contractor, L. Perramont; signed, Oct. 14; filed, Oct. 18; cost $2100.

Ellis near Jones. Concrete and cement work; owner, Joseph Hume; contractors, Cushing, Wetmore Co.; signed, Oct. 8; filed, Oct. 24; cost $2350.

Fell near Lott. Two-story frame; owner, J. F. English; architect, J. V. Hall; contractor, F. W. Kern; signed, Oct. 23; filed, Oct. 29; cost $4310.

First Ave. near Point Lobos. School Building; owner, City of San Francisco; architect, C. I. Havens; contractor, W. Linden; cost $2886.

First Ave. near Point Lobos. Water closets and drainage; owner, Board of Education; architect, C. I. Havens; contractor, W. Linden; signed, Nov. 1; filed, Nov. 5; cost $2866.

Fillmore and Lombard. Lathing, plastering, etc.; owners, Henry and Martin Rathjen; architect, Henry Geilfuss; contractor, Arthur O'Brien; signed, Nov. 6; filed, Nov. 11; cost $1689.

Fillmore and Lombard. Carpenter and mill work for three-story frame; owner, Henry and Martin Rathjen; architect, Henry Geilfuss; contractor, Jacob Schuler; signed, Oct. 10; filed, Oct. 10; cost $7738.

Fillmore and Lombard. Plumbing, gas fitting, etc.; owners, Henry and Martin Rathjen; architect, H. Geilfuss; contractor, W. F. Wilson; signed, Oct. 10; filed, Oct. 10; cost $311.

Fillmore and Lombard. Excavations, brick work, etc.; owners, Henry and Martin Rathjen; architect, H. Geilfuss; contractor F. Wagner; signed, Oct. 10; filed, Oct. 10; cost $1059.

Fillmore and Lombard. Plastering, lathing, etc.; owner, Henry and Martin Rathjen; architect, H. Geilfuss; contractor, H. L. Helgoth; signed, Oct. 10; filed, Oct. 10; cost $1065.

Franklin and Oak. Alterations and additions; owner, F. A. Meyer; architect, F. B. Wood; contractor, R. O. Chandler; signed, Oct. 29; filed, Oct. 30; cost $1070.

Front and Broadway. Improvements to warehouse; owner, J. McDonough; contractors, Mahoney Bros.; cost $7000.

Folsom near 25th. Three-story frame; owner, Frank Nelson; architect, C. M. Rosseau; contractor, A. Petry; signed, Oct. 8; filed, Oct. 11; cost $3940.

Fourth near Bluxome. Two-story frame; owners, Simon and Yetta Israel; architect, J. Biller; contractors, Biller & Qualman; signed, Oct. 14; filed, Oct. 16; cost $2556.

Fourth and Welsh. Excavations; owner, John Shirley; architects, De Prosse & Meusdorffer; contractor, H. M. Peterson & Co.; signed, Oct. 24; filed, Oct. 25; cost $225.

Green near Kearny. To build; owner, J. S. Godeau; architect, J. Godart; contractor, A. Petry; signed, Oct. 26; filed, Nov. 1; cost $2000.

Harrison street No. 405. Two-story addition; owner Emma Hare; contractor, W. J. Keything; signed, Oct. 22; filed, Oct. 23; cost $1420.

Jackson and Sullivan Alley. Repairs; owner, W. Vrooman; contractor, J. F. Hills; cost $6000.

Jackson near Hyde. Alterations, except plumbing; owner, S. Polack; architect Saifield & Kohlberg; contractors, Bratcher & Griffith; signed, Oct. 24; filed Oct. 25; cost $1800.

Jackson near Baker. Two-story frame; owner, Eleanor Howell; architect, R. H. White; contractors, Campbell & Pettus; signed, Oct. 23; filed, Oct. 26; cost $5140.

Laurel Hill Cemetery. Vault; owner, O. F. Willey, ex. estate of J. Wheeland architects, Townsend & Wyncken; contractor, M. F. Redmond; signed, Oct. 9; filed, Oct. 11; cost $1275.

Laurel Hill Cemetery. Granite and marble vault; owner, F. M. Husted; contractor, Rocklin Granite Co.; signed, Oct. 10; filed, Oct. 12; cost $3173.

Laguna and Jackson. Tile work for five bath rooms; owner, W. F. Whittier architect, Edward F. Swain; contractor, Montague & Co.; signed, Nov. 1 filed, Nov. 7; cost $1018.

Market near 5th. Plastering work; owner, Mrs. A. M. Parrott; architects Pissis & Moore; contractor, A. C. McTavish; signed, Nov. 5; filed, Nov. 7 cost $4000.

Market near 5th. Floor tiling; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, T. F. Rigney; signed, Oct. 7; filed, Oct. 19; cost $2000.

Market and 6th. Alterations; owner, D. Hewes; architect, S. Newsom; contractors, Ackerson & Paterson; cost $1000.

Market and 10th. All work for re-construction of brick building; owner, Timothy Hopkins; architect, H. A. Schulze; contractors, Ingerson & Gore, signed, Oct. 28; filed, Nov. 4; cost $11,090.

Market near Noe. Three-story frame; owner, Josephine W. Cory; architect, Seth Babson; contractor, James A. Smillie; signed, Sept. 30; filed, Oct. 23; cost $4620.

Mason and Greenwich. Retainting walls, etc.; owner, Catherine Dondero; architects, Havens & Toepke; contractor, W. E. Ambrose; signed, Oct. 22; filed, Oct. 24; cost $3250.

Mason near Jackson. Alterations; owner, J. H. Drossel; architects, Kenitzer & Barth; contractor, C. Krecker; signed, Oct. 19; filed, Oct. 19; cost $4077.

Mission and Ridley. Alterations and additions; owner, P. C. Casey; contractor, Jas. Maguire; signed, Oct. 19; filed, Oct. 19; cost $1350.

O'Farrell near Stockton. Fire proof partitions; owners, Gutzeit & Malfanti; architects, Pissis & Moore; contractor, H. Ralston; signed, Oct. 14; filed, Oct. 15; cost $1487.

Page and Buchanan. Alterations and additions; owner, Mary J. Keane; architects, Percy & Hamilton; contractor, B. F. Ellis; signed, Nov. 5; filed, Nov. 7; cost $7031.

Page and Buchanan. Plumbing, gas pipe, etc.; owner, Mary J. Keane; architects, Percy & Hamilton; contractors, W. S. Snook & Son; signed, Nov. 5; filed, Nov. 7; cost $1230.

Page near Broderick. Two-story frame; owner, John Muller; architect, W. H. Lillie; contractor, J. H. Moore; signed, Oct. 19; filed, Oct. 23; cost $3233.

Parker Ave., lots 8 and 9. Frame building; owner, T. Alborn; contractor, Jos. Heaney; signed, Oct. 30; filed, Nov. 4; cost $2040.

Pine near Gough. Alterations and additions; owner, Mrs. M. J. Morffew; architect, M. J. Lyon; contractors, Fenn & Weste; signed, Oct. 15; filed, Oct. 31; cost $1300.

Pine and Central Ave. Alterations and additions; owner, Joseph Beyersdorf; contractor, E. Roettger; signed, Oct. 14, filed, Oct. 16; cost $2360.

Point Lobos and 1st Ave. Two-story frame, except mantels and gas fixtures, owner, F. M. Flugger; architect, C. F. Robinson; contractor, E. A. Priest; signed, Oct. 9. filed, Oct. 11; cost $3790.

Potrero Ave. and 21st. Cottage; owner, Alexander Tillie; contractor, R. W. Smith; signed, Oct. 15; filed, Oct. 17; cost $1775.

Post near Broderick. Alterations and additions; owners, Julius and Mary Heyman; architect, Henry Geilfuss; contractor, C. Schutt; signed, Oct. 21; filed, Oct. 21; cost $1140.

Post and Devisadero. Planning mill work; owner, J. W. McDonald; architects, Havens & Toepke; contractors, C. M. Depew Planing Mill Co.; signed, Oct. 17; filed, Oct. 25; cost $2800.

Post near Scott. Two-story frame; owner, Samuel Solomon; architect, M. J. Lyon; contractor, Hienrick Pauls; signed, Oct. 18; filed, Oct. 30; cost $3300.

Sacramento near Steiner. Two-story frame; owner, Charlotte E. Blyth; contractor, Richard Cook; signed, Oct. 9; filed, Oct. 10; cost $4100.

Scott near Pacific Ave. Two-story frame; owner, Millie L. Wright; architect, W. H. Lillie; contractor, J. G. Adams; signed, Oct. 25; filed, Oct. 29; cost $10,666.

Scott near Pacific Ave. Plumbing, gas-fitting, etc.; owner, Millie L. Wright; architect, W. H. Lillie; contractor, W. F. Wilson; signed, Oct. 26; filed, Oct. 26; cost $1462.

Seventeenth Ave. near K. N. W. Alterations and additions; owner, David Paul; contractor, John T. Coleman; signed, Nov. 2; filed, Nov. 5; cost $1530.

Sixth and Folsom. Additions and new three-story frame; owner, M. Israel; architects, Saifield & Kohlberg; signed, Nov. 5; filed, Nov. 6; cost $8350.

Steiner near Broadway. Two-story frame; owner, Pauline Bachman; architect, M. J. Lyon; contractor, H. Jacks; signed, Oct. 5; filed, Oct. 12; cost $5550.

Steiner near Hayes. Two-story frame; owner, M. Kavanagh; days work; cost $3000.

Steiner near Hayes. Two-story frame; owner, M. Kavanagh; days work; cost $8000.

Silver near 3d. Six flats; owner, Thomas Clark; cost $5000.

Stuart near Mission. Excavating, piledriving, etc.; owner, E. R. Lilienthal; architect, Clinton Day; contractors, S. F. Bridge Co.; signed, Nov. 7; filed, Nov. 11; cost $3400.

Sutter and Jones. Wood and metal lathing patent plaster; owner, Dr. M. Herzstein; architect, M. J. Lyon; contractors, Spencer & Tobib; signed, Oct. 17; filed, Oct. 28; cost $3900.

Sutter and Jones. Painting, etc.; owner, Dr. M. Herzstein; architect, M. J. Lyon; contractors, Ehat & Ellert; signed, Oct. 16 filed, Oct. 25; cost $2500.

Union near Devisadero. Mill work; owner, Mrs. May B. Angus; architect, J. H. Littlefield; contractor, O. E. White; signed, Oct. 4; filed, Oct. 11; cost $1710.

Twelfth Ave. near California. Water closets for school house; owner, Board of Education; architect, C. I. Havens; contractor, William Linden; signed, Nov. 1; filed, Nov. 5; cost $3753.

Twenty-second and York. Two-story frame; owner, Anton Halbritter; architects, Martens & Coffey; contractor, H. Helbing; signed, Oct. 10; filed, Oct. 10; cost $2970.

Twenty-second and Treat Ave. Two and three-story frame buildings; owner, Charles Groezinger; contractor, W. W. Rednell; signed, Oct. 31; filed, Oct. 31; cost $9000.

Twenty-second street No. 217. Additions and alterations; owner, Mary Pendergast; architects, Martens & Coffey; contractor, James Mooney; signed, Nov. 5; filed, Nov. 7; cost $1020.

Twenty-third near Mission. Two-story frame; owner, Niles Thompson; architect, M. J. Welsh; contractor, J. W. Coburn; signed, Oct. 9; filed, Oct. 9; cost $1700.

Twenty-fourth and Sanchez. Additional story; owner, R. E. Ecklen; carpenter, John Blake; raising, etc., A. T. Penebsky; cost $2000.

Twenty-eight near Dolores. One-story frame; owner, Geo. W. Kennard; contractor, O. W. Forsyth; signed, Oct. 28; filed, Nov. 6; cost $1600.

Van Ness Ave. Boat house for Dolphin boat club; owners, Dolphine Boat Club; architect, A. C. Lutgens; contractor, W. Linden; cost $1490.

Van Ness Ave. Bulkhead and granite steps; owner, F. A. Frank; architect, Clinton Day; contractor, Dan'l M'Phee; signed, Oct. 28; filed, Nov. 7; cost $1050.

Waller near Laguna. Additions to Engine House; owner, City of San Francisco; architect, C. Wilson; contractors, Holm & Sheibley; cost $5342.

ONCE more the inquisitive San Francisco newspaper has inquired of the Treasury Department why we have not seen that new postoffice building on the lot purchased for it some years ago, and once more we have been told that we must be patient. Now patience is a virtue, and to be virtuous is to be happy, so San Francisco should consider herself happy, and really she ought to be. There are no joys so pure as the delights of anticipation—and really we have been greatly favored in that respect; what will the sordid reality in brick and stone compared with the delightful visions of our active imagination.

A young lady who was asked why she was always so happy and contented replied as follows: "Why ever since I was a little girl, my father has been promising me a sealskin sack for Christmas." "But," replied her friend "you have never received it!" "No, but every Christmas father promises to send me to enjoy my summer vacation in the country if I will forego the sack, so I am always contented and happy!"

But it ts really a serious question that the public business of this nation should be so carelessly administered. Just now we are aware that Uncle Sam is too poor to do his business in a business like manner, he even has to borrow some hundreds of millions to keep up his credit, and really you see under such conditions it would be too extravagant to employ a competent architect as a private individual would do, under like circumstances. O no! just think how much more economical it is to employ a few draftsmen in place of an educated architect, who has the presumption to ask five per cent for his services! and he even cannot employ enough draftsmen to do the work when it should be done. "No, let the people wait a while longer; there are a few corporations waiting for pecuniary favors; there are a few millions in interest on money lent to railroad corporations, that the corporations want us to pay, (to say nothing of the original debt) and then I must pay a little attention to passing a few laws for other corporations."

Now the truth is the corporations practically govern this country. There is no use in shutting our eyes to the dismal fact that that we are no longer a free people, for we are not! A President harrison recommends a postal telegraph for the benefit of the people of the United States; a wannamaker attempts to carry the recommendation into execution, and it is whispered that a JAY GOULD will tell them to stop, and THEY STOP!

A Standard oil is accused of electing a Senator by bribery and the Senate of the United States declines to hear any

evidence in the case, a Collis P. wants an extension of time, and a few people think he won't get it—but how many?

If this country is to become the great nation its founders hoped, it will have to change its laws to give the honest mass of the people a chance to legislate directly, without the interference of elected representatives. The only way to do this is by the Initiative and Referendum.

STONE from sundry quarries and their comparative merits have come to the fore lately in San Francisco, as there are at least three large public buildings to be at once commenced in that city. Any building for the public use should have expended on it, as well as the best talent, the best material obtainable; irrespective of State or even National lines. We want the best wherever it comes from, but when within a State there is found material of as good quality as any outside, it becomes then the duty of its representatives to select such.

In the matter of building stone there is as good as any obtainable in California so that there is no reason in going outside of that State for stone for our New Ferry Building or for any other of our prospective public buildings. It would be invidious to name any particular quarry when there are so many good ones scattered throughout the length and breadth of the State of California—and some within a very few miles of the site.

Proper economy points therefore when there are many quarries of stones of equal strength to choose that which most economizes labor in working and in transportation.

WE see with some concern that the abandonment of Buena Vista Park in San Francisco is broached. It is to be hoped that the Park Commissioners have no serious desires in that direction. A closure of any open space belonging to any city is an economic mistake.

The tendency now-a-days is to more municipal control not less, and by no means let a tittle of the City's property be given up. Once San Francisco did this in the case of Yerba Buena Park and has regretted it ever since.

Buena Vista Park is situated on the top of a hill which is useless for residence purposes except by a great expense in grading. The picturesque steep places which now adds to its beauty would be in the way of streets and residences. In truth all of the tops of the hills of the city should be acquired by the municipality for park purposes, should be planted out with trees to form wind breaks and clothing, and crowned by obelisks or other monuments perpetuating the memory of some heroic action or person.

This idea being adopted, no more will the artistic eye be tortured as it gazes on the glories of the setting sun in the Golden West, by having its gaze arrested by the hideous outlines of chimney sweep's and clothier's advertisements which now crown the terminal points upwards of the City's landscape which under better conditions would finish with its natural grandeur and solemnity the Vista of its main street.

TWENTY-NINTH ANNUAL CONVENTION OF THE AMERICAN INSTITUTE OF ARCHITECTS.

CONTINUED FROM NOVEMBER NUMBER.

THE general purport of Section X in its amended form is this: Taking it for granted that it is desirable to increase membership in the Institute, and that there are certain architects who for one reason or another desire to obtain such membership while they do not care to acquire active membership in the nearest Chapter, the amended Section X allows such Chapters as may so desire to establish a second-grade of Chapter membership at half the usual dues of such Chapter, whatever they may be. The payment of such half dues assures to the members paying them no vote in control of the Chapter's actions; it is only an enabling step which will allow the members to then seek admittance to the Institute itself under the usual conditions and stipulations and upon payment of the full initiation fee and annual dues, as now. Entrance to the Institute can still only be obtained through the Chapters, except in cases of isolation as now, and except that the Directors, in their discretion, may elect to direct membership in the Institute any architect who for twenty years had honorably practised his profession.

In order to prevent this "half-grade" membership from being deterimental to the Chapter, it is provided that if such member at any time resigns from the Chapter he, *ipso facto* resigns also from the Institute, and on the other hand resignation of such half-grade Chapter member from the Institute carries with it resignation from the Chapter. Moreover it is anticipated that as all are more closely and more naturally interested in the local matters these half-grade Chapter members will not be content to be mere onlookers, but will sooner or later wish to have a voice in their control and will so become full members of the Chapter as well as of the Institute, even if it does entail a slight additional expense.

To these and other slight verbal changes in Section X was added a clause of possible usefulness but containing so large a germ of contention that it is remarkable that it should have been adopted. This new clause empowers the Directors to issue a charter to a new Chapter for a territory which is either wholly or partially occupied by an existing Chapter and covered by its charter. Action of such nature can be taken by the Directors only after consulting the wishes of the Chapter first in the field and weighing the value of the arguments it may prefer against the invasion of its territory; but if the Directors consider the advantage to accrue to the Institute itself through the dual occupation of the territory sufficient to outweigh the objections of the elder Chapter, they can grant the second charter in spite of the opposition, and the invaded Chapter seemingly has no right of appeal to any one.

With the exception of this last-mentioned measure the amendments were all very desirable ones and are so carefully considered that no Chapter right is lessened or invaded, while they offer the chance of a great material benefit to the Institute itself. Probably the trouble that is dormant in the clause relating to dual charters may never declare itself, since the President stated that his two years' observation of the working of the Directors had shown him that in cases of uncertainty the Board inclined more toward inaction than to hasty action.

Aside from the reports of the standing committees and the opening address, the entire day was consumed by the discussion of the amendments to the By-laws.

In his opening address Mr. Burnham developed at least one important and interesting suggestion. He said he felt that it was full time that the Institute had its own proper and respectable quarters, not merely a room or suite of rooms, but a building of proper architectural character erected in some city—presumptively, New York—owned and controlled by itself and in which it could have not only its meeting-rooms and library, but also have a "memorial room" in which could be safely gathered and exhibited memorials and portraits of distinguished members of the profession and such of the original drawings of their important works as it is really desirable to preserve. Under present circumstances such drawings and records, on an architect's death, are left to the generally inappreciative care of his heirs and are destroyed, injured or mislaid and lost sight of sooner or later, and in this way valuable personal and professional data are made absolutely unproductive of good. This condition of things seemed to be not only wrong, but needless. These data should be secured by the Institute and placed in a memorial room in a fire-proof building, and he felt not only that such a building should be built but that it could be built.

When he had committed himself by this rather ambitious suggestion, it might have been expected that he would explain how easy it would be to gather together a syndicate who, using the Institute as a nucleus and bait, should proceed to erect an office-building and lease office-room to dealers in building-supplies and to those who are always seeking for well-lighted studios; that by doing things in this purely business way the undertaking of providing a home for the Institute could be safely and economically undertaken. But not at all! Such a scheme as this was far from Mr. Burnham's thought. He at once made it plain that he had conceived the project from the highest conceivable point—that he believed that it would be possible for the Institute to have built for it by the wealthy friends of Art, a building which should be purely devoted to administering to the real need and requirements of architecture as represented by the Institute, a building that should be a worthy memorial of the architects who have gone before and a true record of the best that American architecture is capable of accomplishing at the close of the nineteenth century.

It is an interesting and audacious suggestion, but not by any means one which cannot be carried out, and the Convention appointed Messrs. Burnham of Chicago, Post of New York and Warren of Boston, a committee to carefully consider the suggestion and devise a consistent scheme of procedure.

Mr. Stead, of Washington, said he believed that it would be entirely possible for the Institute to procure at least the temporary use of a suitable room for the storage and display of its valuable collections in the new Congressional Library Building.

The futility, the uselessness of much of the cumbrous machinery that associations of all kinds find it necessary to maintain through a blind respect for traditional methods, although the existence of this useless machinery is the cause of the constant tinkering which annual conventions of all kind waste their time over, was beautifully shown by the report of the Standing Committee on Foreign Correspondence. Mr. Jenney reported that he had found the greatest difficulty in finding out where the records of foreign correspondence were and who had them. Having at length hunted them down, he proceened to acquaint himself with his new duties by a study of these recovered archives, but found that they consisted of copies of a single letter written in 1874 and a second letter in 1884, and that as the periodicity of these foreign communications was already exceeded, he would be very much obliged if any one would instruct him as to who should be the recipient of the overdue decennial letter. Yet, the Convention in place of abolishing this committee has gravely continued it in office. Is the honor of filling a wholly useless office really of any value to any one?

The Committee on Uniform Contract was, however, discharged.

The report on Proportionate Representation of Chapters was not forthcoming and this matter therefore, received no consideration. Neither was it possible to take any action on the proposed change in the Constitution, because not enough members had forwarded their letter-ballot. The Convention authorized the Secretary to issue a new letter-ballot in a hope that a decision might, at length, be reached.

There was practically nothing in the way of business to come before the Convention on the second day, and the morning was in the main occupied by the reading of two very interesting papers of very similar character, and both inferentially expressing a feeling of yearning and dissatisfaction. Both contained abundant good suggestions, and afforded ample food for consideration and discussion—too ample, in fact, for when those who had listened attentively began to express their views on what they had heard they spoke with unusual timidity, as if they were not sure that they understood just what the writer of the papers really recommended that the Institute should attempt to do.

As the text of these papers is not before us at the moment, we confess to the same doubt as to the precision of our recollection of the nature of the recommendations actually made, so it is not possible to discuss them here. The papers will be published in full, and more than this, their subject matter is positively assigned for full consideration next year, the matter being brought up by the report of a special committee, consisting of Messrs. Clay, Patton and Sullivan, of Chicago.

The rather important attempt that was made to discuss the matter on the floor, not only revealed the uncertainty of mind we refer to, but also showed that, if continued, the discussion would inevitably wander over so wide a field that a great amount of time would be consumed in reaching decisions upon many of the points which had been made by the writers. The Convention, therefore, wisely concluded that the proper course would be to refer these papers to a committee. This committee, however, is not to consider the matter and make a report of the views which its unassisted wisdom enables it to prepare: it is instructed to seek advice and suggestion from every quarter and then to collate, compare and digest the suggestions they may in this way receive and submit a full report in print thirty days before the assembling of the next convention. As this committee is expected to have abundant work to do, it was thought best that its members should all reside in the same city, so that they might have easy and proper meetings for discussing their work.

As the next Convention is to be held at Nashville—at the urgent invitation of Mr. W. C. Smith, backed by the Mayor, the centennial exhibition authorities, the Governor of the State and sundry other officials of prominence—and

as Nashville has but little to tempt architects to travel long distances, it is not unlikely that this report, which may be important and may recommend radical and even violent organic changes, may be discussed and acted on by only a small number of the members of the Institute, and this, it seems to us, would be possibly very unfortunate.

This possibility emphasizes in a fresh way the desirability of a permanent house for the Institute, to which all would soon form the habit of restorting, as a matter of course and annual occurrence. The chance wisdom of the past peripatetic assemblages might be expected than to give way to the consistent and sustained policy of those men who have the welfare of the profession sufficiently at heart to take part in the guidance of thought and action at other times than those irregularly occurring seasons when a convention chances to be held in the city of their residence.

The evening was made truly memorable by Mr. Van Brunt's tender and feeling eulogy of Mr. Hunt; his life work and the influence he has had not only on the architecture of this country, but still more upon its architects. How great this influence was we imagine Mr. Hunt never suspected until the coalition convention of Cincinnati took place. At that time, it may be remembered, that a letter from Mr. Adler was read in which he stated fully, frankly and persuasively the strong belief he felt that Mr. Hunt was the one man best fitted for the presidency of the reorganized Institute. The unexpectedness and the delicacy of the tribute was too much for Mr. Hunt, and breaking down absolutely in his attempt to say a word or two—perhaps the only time in his life when words failed him—he could only bury his face in his hands and sob like an hysterical woman.

Mr. Van Brunt was followed by Mr. Post, Mr. Kendall and Mr. Ferry, but Mr. Van Brunt's words hardly required endorsement or strengthening.

Between the morning and the evening session the local Chapter, according to custom, conducted their visitors in coaches and carriages through the new residence portion of the city and the beautiful natural Forest Park. To Eastern men this excursion was a surprise and a revelation. Almost all had expected to find a flat and uninteresting prairie country, so far as its natural characteristics were concerned, with here and there some piece of interesting architecture; but none of the Eastern men were at all prepared for the varied character of the natural scenery nor for the very great amount of interesting and refined work that the younger architects of St. Louis have been doing in the last few years.

The drive was interrupted at several points: first, to examine the extremely interesting group of improved warehouses, known as the "Cupples group," which have been devised and carried out by Messrs. Eames & Young in such a way that not only have the wholesale grocery and hardware trades of St. Louis been revolutionized, but the city has been endowed with an architecturally monumental group of buildings. The second stop was at Washington University, where Professor Johnson had prepared some tests on full-sized wooden beams and posts. Very few, probably, carried away with them any remembrance of the figures which resulted from the test, but all have a vivid recollection of how the beam broke down and the post crimped up under the enormous strain, which was enough even to force the oil through the five-inch cast-steel wall of the cylinder. The final stop came at the Columbian Clubhouse, designed by Mr. A. F. Rosenheim, where all, having first washed off the soot—the only one disagreeable feature of the visit to St. Louis—sat down to one more of the "lunches" with which the visitors have been so bountifully provided.

The ballot for officers on the last day resulted in the election of George B. Post, of New York, President; Henry Van Brunt, of Kansas City, First Vice-President; Wm. C. Smith, of Nashville, Second Vice-President; Alfred Stone, of Providence, Secretary; S. A. Treat, of Chicago, Treasurer; and D. H. Burnham, of Chicago; J. W. McLaughlin, of Cincinnati, W. S. Eames, of St. Louis, C. F. McKim, of New York; F. M. Day, of Philadelphia; N. S. Patton, of Chicago; R. D. Andrews, of Boston, as Directors for three years. Mr. W. R. Briggs, of Bridgeport, was elected a Director vice Van Brunt promoted.

Mr. Berg's paper on discoloration of plaster elicited more practical discussion than any that was read, Mr. Post, in particular, drawing upon his large experience for the benefit of those present. He said that the new asphaltic material, described by Mr. Berg, might prove to be a very useful thing, but that he had been advised by Mr. Theodore Cooper that while asphaltic compounds could be safely used in dry places, they oxidized rapidly in the presence of moisture. For himself, he believed that so far as the protection of iron went—for which Mr. Berg had suggested the new compound might be used—he believed there was nothing better than simple boiled linseed oil mixed with a little lamp-black, or better still, with a little chrome yellow, as this latter material would make it easier to discover imperfections in the protecting coating. Next to this, finely-ground graphite in boiled linseed oil mixed with a pure Japan varnish for a dryer, he had found most desirable. Unfortunately, the best coating of all, pure red-lead in oil, could not be used, because it set with such rapidity. In all cases, no matter what covering material was used, the first consideration was to thoroughly clean the iron and then to use plenty of muscle in brushing on the oil.

Mr. Bullard's paper on the Woods of Washington brought out a protest from Professor Johnson, who declared that the tests quoted were imperfect in character and the results misleading, worthless and mischievous. As the time for final adjournment had arrived, the Chair had to cut the discussion short and invited Professor Johnson to reduce his remarks, made and unmade, to writing, that the Institute might have the advantage of their publication in the Proceedings.

After adjournment the visitors were driven to another section of the city and to still another beautiful park, and the break in this trip occurred at the great Anheuser Busch Brewery. Here, too, hospitality declared itself in the form of another lunch, which, naturally, was not served dry.

As the Eastern trains leave late in the evening the thoughtfulness of the hosts was shown by their preventing any of the usual uneasy loitering about in hotel corridors, by taking every one to the theatre. In simple truth, the St. Louis Chapter, by the perfection of their arrangements and the bounteousness of their hospitality has made it very difficult for any Chapter playing the host in the future to equal the record that has been made this year. After all, there is much of real value in the informal proceedings at these annual conventions and it is by no means wasted effort to make them thoroughly enjoyable and attractive.

The apothegm with which Mr. Post acknowledged his election as President was a fitting valedictory. He declared that there were two things that each architect should consider a duty: first, to become, or attempt to become, a member of the American Institute of Architects, and, second, having acquired membership, then to do the utmost in his power to elevate the standard of architectural and professional performance.—*The American Architect and Building News.*

BRICK-DUST MORTAR AS A SUBSTITUTE FOR HYDRAULIC CEMENT.

THE use of brick-dust mortar as a substitute for hydraulic cement, where the latter cannot be obtained, is now recommended; experiments made with mixtures of brick-dust and quicklime showing that blocks of one-half inch in thickness, after immersion in water for four months, bore, without crushing, crumbling, or splitting, a pressure of 1500 pounds per square inch. It is considered too that the addition of even as small a proportion as one-tenth as much brick-dust as sand to ordinary mortars, is preventitive of the disintegration so often characterizing mortars used in the masonry of public works. The use of brick-dust mixed with lime and sand is said to be generally and successfully practiced in the Spanish dominions, and is stated to be in all respects superior to the best Rosendale hydraulic cement in the construction of culverts, drains, tanks, or cisterns and even roofs, whether for setting flat tiles or for making the usual tropical flat roof. The proportions used there in the manufacture are, approximately one of brick-dust, one of lime, and two of sand, mixed together, dry and tempered with water in the usual way.—*Arthur Lee in Stone.*

ASBESTOS.

ASBESTOS is a wonderful substance, says the *Engineer*, The name comes from a Greek word meaning inconsumable. Fire will not burn it; acids will not gnaw it; weather will not corrode it. It is the paradox of minerals, for it is quarried just like marble. The fibres of which it is composed are soft as silk and fine and feathery enough to float on water. Yet in the mines they are so compressed that they are hard and crystalline like stone. Although the substance has been known for ages in the form of mountain cork or mountain leather, comparatively little has been learned as to its geological history and formation. A legend tells how the Emperor of Charlemagne, being possessed of a tablecloth woven of asbestos, was accustomed to astonish his guest by gathering it up after the meal, casting it into the fire, and withdrawing it later cleansed, but unconsumed. Yet, although the marvelous attributes of asbestos have been known for so long, they were turned to little practical use until about twenty years ago. Since that time the manufacture of the material has grown until it can take its place with any of this country. Indeed, so rapid has been its progress and development, that there is almost no literature of any kind on the subject and, to the popular mind, it is still one of those inexplicable things.

Up to the late seventies, nearly all the asbestos used to come from the Italian Alps and from Syria, but one day explorers discovered a rich deposit in the eastern township of Quebec. Companies were formed, and in 1879 the mines were opened. Remarkable as it may seem, however, although the Canadians started factories, in the operation of which they were substantially backed by English capital, it was an American concern, with headquarters in New York, that developed the industry most rapidly. The company has now grown so large that it has branches in nearly all of the large cities of the country, and the machinery used is specially made and peculiarly adapted to the manufacture of asbestos articles. There is also a large number of factories in England. The veins of chrysotile, as the Canadian asbestos is called, are from two to four in thickness, and are separated by thin layers of hornblende crystals. The nearer to the surface the veins run, the coarser are the fibres and the less valuable. The mining is done by the most improved machinery. Holes are drilled in long rows into the sides of the cliffs by means of steam drills. They are then loaded with dynamite and exploded simultaneously in such a way that a whole ledge of flat falls at once. Then the workmen break out as much of the pure asbestos as possible, load it into tubs or trucks, which are hoisted out and run along to the "cobhouse." Here scores of boys are kept busily employed crumbling or "cobbling" the pieces of rock away from the asbestos and throwing the good fiber to one side, where it is placed in sacks for shipment to the factory. The greatest work in connection with the mining of asbestos is in disposing of the waste rock and refuse of the quarry. Only about one twenty-fifth of the material quarried is real asbestos, and the rocky parts have to be carried to the dumps at great expense. As the asbestos comes from the mines it is of a greenish hue, and the edges are furred with loose fibres. The more nearly white asbestos is the better its grade. The length of fiber is also of great importance, the longest being the most valuable. From the mines the asbestos is taken to the manufacturies in the United States.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

MECHANICS' LIEN.—A memorandum of contract filed in the Recorder's office is wholly insufficient when it does not contain "a statement of the general character of the work to do done" when such a statement is required by the statute, and a mere reference to the plans, drawings and specifications, which are neither set out or filed, nor any attempt made to set out their contents or character, does not comply with the statute and the contract is void, so far as a lien is concerned.

Wood v. O. & B. Rapid-Transit Co., Supreme Ct. Cal., 40 Pac. Reporter, 806.

LIABILITY OF CONTRACTOR FOR NEGLIGENCE OF FOREMAN.—The act of the foreman of a building contractor in stretching a guy-rope across a railroad track to aid in taking down a derrick, is within the scope of his authority, so as to render the contractor liable for an accident caused by the rope to a switchman standing on a moving car, when the foreman had general charge of the work, and special charge of moving derricks, though the contractor had instructed him to employ a derrick specialist when moving derricks.

Reinke v. Bentley, Supreme Ct. Wis., 68 N. W. Rep. 1055.

CONSTRUCTION OF BUILDING CONTRACT AS TO ALTERATIONS.—A Contract provided that the builder should forfeit ten dollars for each day that the building remained unfinished after the time fixed by the agreement for its completion. It also provided that any change in the plans, "either in quantity or quality of the

work," should be executed by the builder, "without holding the contract as violated or void in any other respect." During the progress of the work a change was made in the material for the front of the building from brick and granite to Indiana stone, with carved panels and frieze. The difficulty in procuring a prompt delivery of the stone caused delay in finishing the building, and the owners claimed to recoup the stipulated forfeit and set off the loss of rents. By the agreement the owners reserved the right at any time during the progress of the work to make any alterations in the plans and specifications, and it became the duty of the builder to carry them into effect. The provision that the changed plans should be executed without holding the contract as violated or void on any other respect should be read in connection with this reserved right. The words "in any other respect" exclude the implication of any change in terms except such as would result from alteration of the plans, but not such changes as would be the necessary consequence thereof. Alterations calling for more work and materials, might, of necessity, require more time for the completion of the building. They might be directed so near the end of the work as to make it impossible to complete the building within the time stipulated. In this case the building was where the material fixed for the front by the contract could be purchased in an open market and delivered ready for use in one day. The stone required by the alteration could be procured only at the quarries in Indiana, where an order had to await its turn; and, after delivery, it required weeks of skilled labor to fit it for use in the building. For such delay in the completion of the building as was the necessary consequence of the change of plans by the owners the builder was not answerable, and for it no forfeiture could be exacted.

Lilly v. Person, Supreme Court of Pennsylvania, 32 At. Rep. 23.

BOOKS AND PERIODICALS.

THE ENGINEERING REVIEW for November, 1895, is largely given up to a record of the career and work of the Institute of Civil Engineers, it contains two special supplements the first: "An Illustration of the New House of the Institution of Civil Engineers" the second "A Portrait of Sir Benjamin Baker, K. C. M. G., President of the Institute of Civil Engineers."

Sir. Benjamin Baker was the designer of the famous Forth Bridge. On the fourth of March, 1890, the Prince of Wales stated some facts that are worth recalling. The extreme length of the bridge, including the approach viaduct, is one and one-fifth mile and twenty yards. The extreme height of the steel structure above high water mark, and above the bottom of the deepest foundation, is 452 feet.

The wind pressure provided for is fifty-six pounds on each square foot of area, amounting in the aggregate to about 7700 tons of lateral pressure on the Cantilever portion of the bridge.

We have been favored with a CATALOGUE of GLADDING McBEAN & CO., manufacturers of Vitrified Salt Glazed Sewer Pipe, as well as Architectural Terra Cotta. The well-known reputation of this firm is a guarantee that anything coming from their works is first-class. Office and depot, 1358 and 1360 Market street, San Francisco., manufactory at Lincoln, Placer County, Cal.

The KALENDAR of the ROYAL INSTITUTE OF BRITISH ARCHITECTS, November, 1895 to October, 1896, London, 9 Conduit street, Hanover Square.

The contents of this Annual show that much information of interest to architects is given. The Constitution and By-Laws, as well as a list of fellows are given, also an account of the mode of conducting the business of the Institute.

The complete novel in the December number of LIPPINCOTT'S monthly magazine is "The Old Silver Trail" by Mary E. Stickney.

In addition to the novel will be found an interesting list of articles from grave to gay, intended doubtless to give satisfaction to the many subscribers to this excellent magazine of every class however somber, or however gay.

The Journal of the ROYAL INSTITUTE OF BRITISH ARCHITECTS for November, 1895, contains the opening address, delivered by President Francis C. Penrose, F. R. S., at the first general meeting November 4, 1895. The address takes a wide review of what has been done and makes many suggestions that cannot fail to be of interest to architects in general. His remarks under the head of "Competitions and Competitors" are certainly very applicable to our architects, as well as those on the other side.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.
SETH BABSON, Pres. W. P. MOORE, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
OCTAVIUS MORGAN, PRES. A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec'y. AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

WAGES AND RENT.

WORKMEN in this world are paying too much of their wages for rent! This is the opinion of Carroll D. Wright, United States Commissioner of Labor. He comes to this conclusion after making a recent investigation of the housing of the working classes in various countries of the world. One-fifth of the wages earned by the head of a family ought to be the maximum expenditure for rent in cities. This Commissioner Wright says, is agreed by the most competent economists. Hence the workman in the city who earn fifty dollars a month should not pay more than ten dollars of it each month to his landlord.

Commissioner Wright has collected information concerning houses and building enterprises for workmen in all of the larger countries of the world.

A French company which has formulated a scheme to assist its employees to become house-owners, rents a comfortable little cottage of brick and cut stone, with two stories, including a kitchen, parlor and two bed rooms, besides a cellar for only $2.32 per month in American money.

Through a real estate company at Rouen, France, comfortable houses are rented to workmen for about twenty-five cents a week, or four dollars a year, which amounts for those workmen receiving the lowest wages to but one day's salary in a week.

A celebrated chocolate manufacturer at Noisiel houses about 1400 of his employees at an average yearly rent of twenty-nine dollars, which is from a tenth to a twelfth of the wages of each family, besides giving free repairs, taxes, water, schools for employee's children, medical attendance, baths and literary and musical entertainments.

In Belgium there is a semi-official institution, the General Savings Bank, holding deposits guaranteed by the Government. This lends money to workmen at low rates of interest in order to encourage them in building their own homes. Through a system of life insurance likewise established under Belgian law, the family of a workman is given a home in case of his death. Commissioner Wright points with great emphasis to the importance of these institutions of the Belgian Government.

At Pullman, Ill., it is estimated that one-fifth of the wages paid go for rent.—*New York Herald.*

MAXIMS FOR DRAFTSMEN FROM RUSKIN.

THE power of shading rightly depends mainly on *lightness* of hand and *keenness* of sight; but there are other qualities required in drawing dependent not only on lightness, but steadiness of hand; and the eye to be perfect in its power, must be made *accurate* as well as keen, and not only see shrewdly, but measure justly.—*Ruskin.*

NEARLY *all* expression of form, in drawing, depends on your power of graduating delicately; and the graduation is always most skillful which passes from one tint to another *very little* paler.—*Ruskin.*

IN darkness of ground there is the light of the little pebbles or dust; in darkness of foliage, the glitter of the leaves; in the darkness of flesh, transparency; in that of stone, granulation; in every case there is some mingling of light.—*Ruskin.*

AN entire master of the pencil or brush ought indeed, to be able to draw any form at once as Giotto his circle; but such skill as this is only to be expected of the consummate master, having pencil in hand all his life, and all day long, hence, the force of Giotto's proof of his skill.—*Ruskin.*

THE BUILDERS' EXCHANGE.

THE Builders' Exchange of San Francisco is deserving of more than passing mention and praise as a useful and model public institution. Prior to its organization in July, 1890, the building business was in a chaotic state, owing to the absence of a recognized rendezvous and a uniformity in business dealings. At this time the brickmasons and the carpenter contractors each maintained separate small club-rooms for the accommodation of its members, but the vast army of manufacturers, dealers and agents of building materials, and contractors in the various building trades, could never meet each other with a certainty, a chance meeting on the street being all that could be hoped for.

With a view of facilitating business, correcting many evils, and a watchword of "Skill, Honor and Responsibility," a few members of the building business, namely, Chas. C. Terrell, Wm. N. Miller, A. W. Starbird, M. J. Donovan, C. C. Morehouse, J. R. Wilcox, John F. Riley, Wm. Cronan, J. K. Firth, A. Hosmer and George W. Duffy associated themselves together, organized The Builders' Exchange, and outlined its objects and aims as follows:—

"FIRST.—To join *one* association all mechanics, manufacturers and dealers of good repute doing business in city and county of San Francisco, whose vocation connects them wholly or generally with the building industry, either as an employing contractor or manufacturer or dealer in building materials.

"2d.—To establish and maintain among the indivlduals so associated a just and equitable system of dealing and a uniformity in commercial usages by rules and regulations;

to acquire, preserve and disseminate valuable information regarding the business in which they are severally engaged.

"3d.—To procure (either by lease or purchase), furnish and maintain suitable rooms for the use of its members for meeting rooms, offices and other purposes.

"4th.—To establish and enforce a system of arbitration for the settlement of all disputes or controversies which may arise between its members or between its members and their employees and other persons.

"5th—To join or otherwise act in concert with other organizations of Employers of Labor, for the purpose of arbitrating all questions of dispute which may arise between said organization and the members thereof, or any of them, or between any of them and their employees. To the end that all matters of difference between the Employers of Labor and their employees may be amicably settled and adjusted without resort to strikes or lockouts."

Having clearly outlined a broad-gauge policy, the Association thus formed was duly incorporated, and a meeting place established at 330 Pine street, with the following officers:—President, Chas. C. Terrill; Vice-Pres., Wm. N. Miller; Treasurer, A. W. Starbird; Secretary, M. J. Donovan.

The corporation thus fairly started on its noble mission, soon won the confidence of the building fraternity—the brickmasons and carpenter contractors consolidating their clubrooms with the corporation.

The Pine street headquarters were soon deserted for more commodious rooms on Montgomery street, which soon became too small, and the large Hall of the Real Estate Exchange at 16 Post street engaged and the clerical force doubled. Again was it necessary to secure larger quarters, and a two-story brick structure was erected on the corner of Mission and New Montgomery streets to accommodate its 400 members.

During the Exchange hour, from 12 to 2 each day, may be found all the prominent building material dealers and contractors of San Francisco and bay cities, and business is transacted by an individual in this short time that could not be otherwise transacted in a whole day.

Not only has the power of the Exchange been great enough to correct many minor evils of the building business, but its influence is equally apparent in the Legislative body of the State, and the precepts and customs introduced by the Exchange have so permeated the building industry of San Francisco, that nowhere in the United States is the same volume of business disposed of in the same space of time and the same uniformity as in San Francisco.

The lower floor is used as a general assembly room; here also are the members' letter-boxes, private cases, telephone rooms and office of the corporation. The upper floor is divided up into private rooms, lodge room and directors' rooms. A large dome skylight, assisted by windows on three sides of the building, afford ample light and fresh air.

The Exchange is open to members and the public on all business days from 8 A. M. to 5 P. M., and an invitation is cordially extended to all parties identified with the building industry and the public in general to visit the Exchange, and examine into its workings.

The present officers and members are as follows:

President, Oscar Lewis; Vice-President, O. E. Brady; Secretary, Jas. A. Wilson; Treasurer, L. B. Sibley; Directors, W. B. Anderson, James McInerny, Chas. Dunlop, A. Kendall, Thos. W. Butcher, Thos. Elam, John T. Hayes; Recording Secretery, E. A. Larsen; Financial Secretary, S. D. North; Attorney, Wm. H. Cobb.

MEMBERS BUILDERS' EXCHANGE.

	Box No.
Abrahamson, P.; patent ventilators	123
Ackerson & Patterson, contractors and builders	343
Adams, John G.; contractor and builder	270
Alameda Brick & Tile Co.; brick	170
Ambrose, William F.; concrete and artificial stone	356

BUSINESS MOSAICS.

No hotel, or other large building can be considered safe if not supplied with the new and improved Chapman Fire Hose Reel. It is the latest improvement and upon examination is universally conceded by all unprejudiced competent authority to be the most simple, practical and reliable Hose Reel apparatus in the word. R. S. Chapman will confirm this statement, 14 and 16 Fremont street, San Francisco.

Goodfellow—If my clothes were not too big for you, I'd give you an old suit. Hungry Hank (gratefully)—Boss, if you'd give me the price of a square meal, I warrant they'd fit me all right.—*Truth.*

N. & G. Taylor Co., Tinplate Manufacturers, Philadelphia, are out in a very neat blotter illustrating the brands of bright tinplates which they make. They state that all of their plates are made of the finest materials, and in a thorough manner, and they also call particular attention to the quality of pig tin used "being of exceptional fineness and purity."

Their "Brilliant" brand, extra fine quality, is the heaviest coated Bright Tin that can be made, and holds the same high position that their celebrated "Taylor Old Style" brand does in the list of brands of Roofing Tin. Buyers of Bright Tinplates should correspond with Messrs. N. & G. Taylor Co.

"Have you change for a $5 note?" asked one man of another. "Yes; certainly I have." "Ah! then lend me $2 for a day or two, there's a good fellow!"—*Tit-Bits.*

The J. L. Mott Iron Works are again to the fore with some more of their useful improvements to their sanitary plumbing work. These specialties are well worth seeing by all interested, at their well equipped show rooms in the Flood Building.

First Kid—Anyhow, I never had no granddaddy hung for horse stealin'. Second Kid—Don't care if he wuz. Horses wuz worth stealin' in them days."—*Cincinnati Enquirer.*

When a man decides upon improving his shop, factory or farm, by the addition of power, he naturally looks for something entirely up to date. He investigates, considers, and finally decides to buy an Ajax Coal Oil Gas Engine as meeting his requirements more fully, and being safer, than any other power obtainable. Palmer and Ray, San Francisco, Cal., the manufacturers of this engine, have earned the gratitude of the public by placing within its reach a reliable, economical power, that defies the restrictions of insurance companies. It is the latest and best.

Rischmuller's Door Opener and closer is another contrivance that you must have to be happy. This door opener and closer is the most simple and perfect of any in the market. A full sized working model can be seen at 329 Nineteenth street. Orders left with Geo. Rischmuller, 329 Nineteenth street, will be promptly attended to.

Miss Gushington—How did you feel when you found that the ship would surely go down in ten minutes? Captain Salted—I felt for a life-preserver.—*Harper's Bazar.*

Dixon's Silica Graphite Paint, manufactured by the Joseph Dixon Crucible Co., of Jersey City, N. J., will be used in painting all the tin work and skylights of the Post Office Department Building at Washington. A quantity will also be used on the Capitol, and the District Government Building.

Dudely—What are you going to be when you are grown up, Bobby? Bobby—I'm going to be a man. What are you going to be?—*Harper's Bazar.*

Samson Spot Cord.—If you want the best cord in the market, be sure you specify "Samson Spot Cord." Samples supplied upon application to the Samson Cordage works, Boston, Mass.

Miriam—Don't you think my new hat a poem, Ned? Ned—From its height, dear, I should instead compare it to a short story.—*Judge.*

The well known firm of J. L. Mott Iron Works, established in 1828, furnish a wonderful illustration of the vast improvements made in the line of their business since that date. Few are now living who were of age to appreciate good plumbing, when these works were first established, but the constant improvement ever since that time has been no secret to the public, who in the long run are always ready to respond and encourage a firm who appear ever ready to adapt new methods and devices where the welfare of their customers is concerned.

Mr. M. S. James, the Pacific Coast representative of the firm, has opened a new office and show rooms at 27 Flood Building, San Francisco.

Mrs. Snagg—I understand that paper is made of wood now. Mr. Snagg—Yes, so is string. "String?" "Yes; what else do you suppose cordwood is used for?"—*Telegraph.*

All those who are troubled by the annoyance of flies, we would say call upon Edward B. Hindes & Co., 411 Mission street and examine their perfection window screens, if you once enjoy the comfort they give you will never be without them. A catalogue and prices will be forwarded upon application at their office.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.
SETH BABSON, Pres. W. P. MOORE, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
OCTAVIUS MORGAN, PRES. A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec'y. AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

WAGES AND RENT.

WORKMEN in this world are paying too much of their wages for rent! This is the opinion of Carroll D. Wright, United States Commissioner of Labor. He comes to this conclusion after making a recent investigation of the housing of the working classes in various countries of the world. One-fifth of the wages earned by the head of a family ought to be the maximum expenditure for rent in cities. This Commissioner Wright says, is agreed by the most competent economists. Hence the workman in the city who earn fifty dollars a month should not pay more than ten dollars of it each month to his landlord.

Commissioner Wright has collected information concerning houses and building enterprises for workmen in all of the larger countries of the world.

A French company which has formulated a scheme to assist its employees to become house-owners, rents a comfortable little cottage of brick and cut stone, with two stories, including a kitchen, parlor and two bed rooms, besides a cellar for only $2.32 per month in American money.

Through a real estate company at Rouen, France, comfortable houses are rented to workmen for about twenty-five cents a week, or four dollars a year, which amounts for those workmen receiving the lowest wages to but one day's salary in a week.

A celebrated chocolate manufacturer at Noisiel houses about 1400 of his employees at an average yearly rent of twenty-nine dollars, which is from a tenth to a twelfth of the wages of each family, besides giving free repairs, taxes, water, schools for employee's children, medical attendance, baths and literary and musical entertainments.

In Belgium there is a semi-official institution, the General Savings Bank, holding deposits guaranteed by the Government. This lends money to workmen at low rates of interest in order to encourage them in building their own homes. Through a system of life insurance likewise established under Belgian law, the family of a workman is given a home in case of his death. Commissioner Wright points with great emphasis to the importance of these institutions of the Belgian Government.

At Pullman, Ill., it is estimated that one-fifth of the wages paid go for rent.—*New York Herald.*

MAXIMS FOR DRAFTSMEN FROM RUSKIN.

THE power of shading rightly depends mainly on *lightness* of hand and *keenness* of sight; but there are other qualities required in drawing dependent not only on lightness, but steadiness of hand; and the eye to be perfect in its power, must be made *accurate* as well as keen, and not only see shrewdly, but measure justly.—*Ruskin.*

NEARLY *all* expression of form, in drawing, depends on your power of graduating delicately; and the graduation is always most skillful which passes from one tint to another *very little* paler.—*Ruskin.*

IN darkness of ground there is the light of the little pebbles or dust; in darkness of foliage, the glitter of the leaves; in the darkness of flesh, transparency; in that of stone, granulation; in every case there is some mingling of light.—*Ruskin.*

AN entire master of the pencil or brush ought indeed, to be able to draw any form at once as Giotto his circle; but such skill as this is only to be expected of the consummate master, having pencil in hand all his life, and all day long, hence, the force of Giotto's proof of his skill.—*Ruskin.*

THE BUILDERS' EXCHANGE.

THE Builders' Exchange of San Francisco is deserving of more than passing mention and praise as a useful and model public institution. Prior to its organization in July, 1890, the building business was in a chaotic state, owing to the absence of a recognized rendezvous and a uniformity in business dealings. At this time the brickmasons and the carpenter contractors each maintained separate small club-rooms for the accommodation of its members, but the vast army of manufacturers, dealers and agents of building materials, and contractors in the various building trades, could never meet each other with a certainty, a chance meeting on the street being all that could be hoped for.

With a view of facilitating business, correcting many evils, and a watchword of "Skill, Honor and Responsibility," a few members of the building business, namely, Chas. C. Terrell, Wm. N. Miller, A. W. Starbird, M. J. Donovan, C. C. Morehouse, J. R. Wilcox, John F. Riley, Wm. Cronan, J. K. Firth, A. Hosmer and George W. Duffy associated themselves together, organized The Builders' Exchange, and outlined its objects and aims as follows:—

"FIRST.—To join *one* association all mechanics, manufacturers and dealers of good repute doing business in city and county of San Francisco, whose vocation connects them wholly or generally with the building industry, either as an employing contractor or manufacturer or dealer in building materials.

"2d.—To establish and maintain among the indivlduals so associated a just and equitable system of dealing and a uniformity in commercial usages by rules and regulations;

to acquire, preserve and disseminate valuable information regarding the business in which they are severally engaged.

"3d.—To procure (either by lease or purchase), furnish and maintain suitable rooms for the use of its members for meeting rooms, offices and other purposes.

"4th.—To establish and enforce a system of arbitration for the settlement of all disputes or controversies which may arise between its members or between its members and their employees and other persons.

"5th—To join or otherwise act in concert with other organizations of Employers of Labor, for the purpose of arbitrating all questions of dispute which may arise between said organization and the members thereof, or any of them, or between any of them and their employees. To the end that all matters of difference between the Employers of Labor and their employees may be amicably settled and adjusted without resort to strikes or lockouts."

Having clearly outlined a broad-gauge policy, the Association thus formed was duly incorporated, and a meeting place established at 320 Pine street, with the following officers:—President, Chas. C. Terrill; Vice-Pres., Wm. N. Miller; Treasurer, A. W. Starbird; Secretary, M. J. Donovan.

The corporation thus fairly started on its noble mission, soon won the confidence of the building fraternity—the brickmasons and carpenter contractors consolidating their clubrooms with the corporation.

The Pine street headquarters were soon deserted for more commodious rooms on Montgomery street, which soon became too small, and the large Hall of the Real Estate Exchange at 16 Post street engaged and the clerical force doubled. Again was it necessary to secure larger quarters, and a two-story brick structure was erected on the corner of Mission and New Montgomery streets to accommodate its 400 members.

During the Exchange hour, from 12 to 2 each day, may be found all the prominent building material dealers and contractors of San Francisco and bay cities, and business is transacted by an individual in this short time that could not be otherwise transacted in a whole day.

Not only has the power of the Exchange been great enough to correct many minor evils of the building business, but its influence is equally apparent in the Legislative body of the State, and the precepts and customs introduced by the Exchange have so permeated the building industry of San Francisco, that nowhere in the United States is the same volume of business disposed of in the same space of time and the same uniformity as in San Francisco.

The lower floor is used as a general assembly room; here also are the members' letter-boxes, private cases, telephone rooms and office of the corporation. The upper floor is divided up into private rooms, lodge room and directors' rooms. A large dome skylight, assisted by windows on three sides of the building, afford ample light and fresh air.

The Exchange is open to members and the public on all business days from 8 A. M. to 5 P. M., and an invitation is cordially extended to all parties identified with the building industry and the public in general to visit the Exchange, and examine into its workings.

The present officers and members are as follows:

President, Oscar Lewis; Vice-President, O. E. Brady; Secretary, Jas. A. Wilson; Treasurer, L. B. Sibley; Directors, W. B. Anderson, James McInerny, Chas. Dunlop, A. Kendall, Thos. W. Butcher, Thos. Elam, John T. Hayes; Recording Secretery, E. A. Larsen; Financial Secretary, S. D. North; Attorney, Wm. H. Cobb.

MEMBERS BUILDERS' EXCHANGE.

	Box No.
Abrahamson, P.; patent ventilators	123
Ackerson & Patterson, contractors and builders	343
Adams, John G.; contractor and builder	270
Alameda Brick & Tile Co.; brick	170

BUSINESS MOSAICS.

No hotel, or other large building can be considered safe if not supplied with the new and improved Chapman Fire Hose Reel. It is the latest improvement and upon examination is universally conceded by all unprejudiced competent authority to be the most simple, practical and reliable Hose Reel apparatus in the word. R. S. Chapman will confirm this statement, 14 and 16 Fremont street, San Francisco.

Goodfellow—If my clothes were not too big for you, I'd give you an old suit. Hungry Hank (gratefully)—Boss, if you'd give me the price of a square meal, I warrant they'd fit me all right.—*Truth.*

N. & G. Taylor Co., Tinplate Manufacturers, Philadelphia, are out in a very neat blotter illustrating the brands of bright tinplates which they make. They state that all of their plates are made of the finest materials, and in a thorough manner, and thev also call particular attention to the quality of pig tin used "being of exceptional fineness and purity."

Their "Brilliant" brand, extra fine quality, is the heaviest coated Bright Tin that can be made, and holds the same high position that their celebrated "Taylor Old Style" brand does in the list of brands of Roofing Tin. Buyers of Bright Tinplates should correspond with Messrs. N. & G. Taylor Co.

"Have you change for a $5 note?" asked one man of another. "Yes; certainly I have." "Ah! then lend me $2 for a day or two, there's a good fellow!"—*Tit-Bits.*

The J. L. Mott Iron Works are again to the fore with some more of their useful improvements to their sanitary plumbing work. These specialties are well worth seeing by all interested, at their well equipped show rooms in the Flood Building.

First Kid—Anyhow, I never had no granddaddy hung for horse stealin'. Second Kid—Don't care if he wuz. Horses wuz worth stealin' in them days."—*Cincinnati Enquirer.*

When a man decides upon improving his shop, factory or farm, by the addition of power, he naturally looks for something entirely up to date. He investigates, considers, and finally decides to buy an Ajax Coal Oil Gas Engine as meeting his requirements more fully, and being safer, than any other power obtainable. Palmer and Ray, San Francisco, Cal., the manufacturers of this engine, have earned the gratitude of the public by placing within its reach a reliable, economical power, that defies the restrictions of insurance companies. It is the latest and best.

Rischmuller's Door Opener and closer is another contrivance that you must have to be happy. This door opener and closer is the most simple and perfect of any in the market. A full sized working model can be seen at 329 Nineteenth street. Orders left with Geo. Rischmuller, 320 Nineteenth street, will be promptly attended to.

Miss Gushington—How did you feel when you found that the ship would surely go down in ten minutes? Captain Salted—I felt for a life-preserver.—*Harper's Bazar.*

Dixon's Silica Graphite Paint, manufactured by the Joseph Dixon Crucible Co., of Jersey City, N. J., will be used in painting all the tin work and skylights of the Post Office Department Building at Washington. A quantity will also be used on the Capitol, and the District Government Building.

Dudely—What are you going to be when you are grown up, Bobby? Bobby—I'm going to be a man. What are you going to be?—*Harper's Bazar.*

Samson Spot Cord.—If you want the best cord in the market, be sure you specify "Samson Spot Cord." Samples supplied upon application to the Samson Cordage works, Boston, Mass.

Miriam—Don't you think my new hat a poem, Ned? Ned—From its height, dear, I should instead compare it to a short story.—*Judge.*

The well known firm of J. L. Mott Iron Works, established in 1828, furnish a wonderful illustration of the vast improvements made in the line of their business since that date. Few are now living who were of age to appreciate good plumbing, when these works were first established, but the constant improvement ever since that time has been no secret to the public, who in the long run are always ready to respond and encourage a firm who appear ever ready to adapt new methods and devices where the welfare of their customers is concerned.

Mr. M. S. James, the Pacific Coast representative of the firm, has opened a new office and show rooms at 27 Flood Building, San Francisco.

Mrs. Snagg—I understand that paper is made of wood now. Mr. Snagg—Yes, so is string. "String?" "Yes; what else do you suppose cordwood is used for?"—*Telegraph.*

All those who are troubled by the annoyance of flies, we would say call upon Edward B. Hindes & Co., 411 Mission street and examine their perfection window screens, if you once enjoy the comfort they give you will never be without them. A catalogue and prices will be forwarded upon application at their office.

CITY BUILDING NEWS.

Andover Ave. near Courtland Ave. Two-story frames; owner, P. Jackvwiski contractor, P. Mandeson; cost $2000.

Baker near Greenwich. Two-story farme; owner, Mrs. Annie Kennedy; contractors, Kenely & Leterell; signed, Nov. 11; filed, Nov. 14; cost $1940.

Bartlett near 26th. Three-story frame; owner, J. M. Comerford; cost $4000.

Broderick near Fulton. Two-story frame; owner, John H. Hendy; contractor, Cranston & Keenan; signed, Dec. 3; filed, Dec. 5; cost $5000.

Bush near Baker. Two-story frame; owner, S. Magnin; architect, W. H. Lillie; contractor, W. Heibing; signed, Nov. 27; filed, Nov. 27; cost $1700.

Clay near Cherry. Two-story frame; owner, John J. Wirtner; architect, G. A. Dodge; contractor, G. H. Moore; signed, Nov. 14; filed, Nov. 18; cost $2008.

Clement near 9th Ave. Frame cottage except brick work, etc.; owner, Mrs. E. Downey; architect, E. Kollofrath; contractor, W. R. Kenney; signed, Nov. 18; filed, Nov. 18; cost $1000.

Cliff House. Sheds; owner, Adolph Sutro; architect, C. J. Colley; contractors, Campbell & Pettus; signed, Nov. 14; filed, Nov. 16; cost $4844.

Courtland Ave. and Kosciusko. Cottage; owner, Mrs. A. Kilstrom; contractors, Reit & Ahlgren; cost $1000.

Duncan near Dolores. Two-story frame; owner, J. M. Comerford; cost $3200.

East near Mission. Two-story brick; owner, Thomas Magee; architects, Percy & Hamilton; contractor, Riley & Loane; signed, Dec. 13; filed, Dec. 13; cost $5749.

Eddy and Hyde. Excavations and brick work; owner, O. H. Hund; architect, A. C. Lutgens; contractor, Ferdinand Wagner; signed, Dec. 2; filed, Dec. 3; cost $1900.

Eddy and Hyde. Carpenter, plastering, etc.; owner, O. H. Hund; architect, A. C. Lutgens; contractor, F. V. Stelnman; signed, Dec. 2; filed, Dec. 3; cost $10,000.

Eleventh near Howard. Alterations and repairs; owner, Mary E. McDonald; architect, J. P. Brady; contractors, G. A. Fisher and T. J. Capp; signed, Nov. 25; filed, Nov. 29; cost $2085.

Farallones near Orizaba. Cottage; owner, Christine Bergdahl; architect, E. Tillman; contractors, Tillman Bros.; signed, Nov. 30; filed, Dec. 4; cost $1390.

Fourth Ave. near Pt. Lobos. Two-story frame; owner, R. R. Hind; superintendents, Townley Bros.; days work; cost $4000.

Fourth near Brennan. Two-story frame; owners, Simon and Yette Israel; contractors, L. Westerlund, J. Sandeen; signed, Nov. 29; filed, Nov. 29; cost $2057.

Fourth and Welsh. Excavations and concrete work; owner, John Shirley; architects, De Prosse & Meusdorffer; contractor, Geo. Goodman; signed, Nov. 16; filed, Nov. 18; cost $4612.

Fourth and Welsh. Carpenter work for two three-story frame buildings and one-story frame building; owner, John Shirley; architects, De Posse & Meusdorffer; contractor, H. A. Conrad; signed, Nov. 16; filed, Nov. 18; cost $14,400.

Fourth and Welsh. Mason work; owner, John Shirley; architects, De Prosse & Meusdorffer; contractors, Miller & Beck; signed, Nov. 16; filed, Nov. 18; cost $1249.

Fourth and Welsh. Plumbing; owner, John Shirley; architects, De Prosse & Meusdorffer; contractor, H. Williamson; signed, Nov. 16; filed, Nov. 18; cost $2124.

Fourth and Welsh. Plastering; owner, John Shirley; architects, De Prosse & Meusdorffer; contractor, W. C. Watson; signed, Nov. 16; filed, Nov. 18; cost $1495.

Fourth and Welsh. Painting; owner, John Shirley; architects, De Prosse & Meusdorffer; contractor, J. F. Sullivan; signed, Nov. 16; filed, Nov. 18; cost $1420.

Fourth and Welsh. Brick work for ovens; owner, John Shirley; architects, De Prosse & Meusdorffer; contractor, Peter Glaser; cost $425.

Green near Hyde. Two-story frame; owner, Patrick Hogan; contractor, H. R. Schmuckert; signed, Nov. 13; filed, Nov. 26; cost $2850.

Julian near 15th. Alterations and additions; owner, Martin Fennell; architects, Shea & Shea; contractors, Bassett Bros.; signed, Dec. 4; filed, Dec. 11; cost $1900.

Lakeview Tract, lot 23, block 25. Two-story frame; owner, Carl R. Carlso - contractor, A. Dahlberg; signed, Nov. 18; filed, Nov. 19; cost $2000.

Larkspur Station. Two-story frame; owner, A. Brazil; contractor, Gustave A. Nagel; cost $2330.

Market near 5th. Stucco work for exterior; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, Chas. Dunlap; signed, Nov. 27; filed, Dec. 5; cost $6700.

Market near 5th. Plastering; owner, Mrs. A. M. Parott; architect, Pissis & Moore; contractor, D. Leahy; signed, Dec. 3; filed, Dec. 10; cost $12,785.

Market near 5th. Plastering for basement; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, D. O'Sullivan; signed, Nov. 15; filed, Nov. 18; cost $17,600.

Market near 5th. Fixtures, counters, etc.; owner, Mrs. A. M. Parrott; architect, Pissis & Moore; contractors, L. & E. Emanuel; signed, Nov. 27; filed, Dec. 5; cost $5475.

Market and 10th. Plumbing, etc.; owner, Timothy Hopkins; architect, H. A. Schulze; contractors, Snook & Son; signed, Nov. 15; filed, Nov. 27; cost $1382.

Masonic Ave. and Haight. Two-story frame; owner, Mrs. J. A. Bogart; architect, W. H. Lillie; contractors, Cranston & Keenan; signed, Nov. 19; filed, Nov. 21; cost $5100.

Masonic Ave. and Haight. Plumbing on five houses; owners, Cranston & Keenan; contractor, G. C. Sweeney; cost $1500.

Mission and Beal. Two-story brick; owner, J. F. Merrill; architects, Percy & Hamilton; contractor, R. Ringrose; signed, Nov. 12; filed, Nov. 13; cost $19,844.

O'Farrell near Powell. Brick building; owner, Frederick Rver; architect, Chas. Geddes; contractor, Jas. McLean; signed, Nov. 16; filed, Nov. 16; cost $11,925.

Onondaga and Country Road. Two-story frame; owner, Catherine Carson; architect, A. J. Barnett; contractor Henry Luke; signed, Dec. 11; filed, Dec. 13; cost $2111.

Page near Webster. Two-story frame except gas-fitting and mantels; owner, H. Gustav Frautner; contractor, A. G. Johnson; signed, Nov. 18; filed, Nov. 23; cost $4271.

Point Lobos Road near Cliff. Frame depot building; owner, Sutro Railroad Co.; architect, C. J. Colley; contractors, Campbell & Pettus; signed, Nov. 14; filed, Nov. 16; cost $3080.

Sacramento near Broderick. Two-story frame; owner, Charles H. Hewitt; contractor, Philip Rive; signed, Dec. 5; filed, Dec. 10; cost $4235.

Second Ave. near California. Cottage; owner, M. Kahn; contractor, H. Peterson; signed, Nov. 26; filed, Nov. 30; cost $2000.

Stevenson near 3d. One-story brick; owners, Edison Light and Power Co.; architects, Percy & Hamilton; contractors, Riley & Loane; signed, Nov. 20; filed, Nov. 21; cost $3449.

Stuart near Mission. Excavations, pumping, etc.; owner, E. R. Lilienthal; architect, Clinton Day; contractors, Gray Bros.; signed, Dec. 9; filed, Dec. 11; cost $2985.

Sutter near Buchanan. Two-story frame; owner, A. G. Morris, architects, Herman & Swain; cost $4000.

Sixth and Townsend. Four smoke houses; owner, Western Meat Co.; architect, L. Greenbaum; contractor, Thomas Butler; signed, Nov. 29; filed, Nov. 30; cost $3045.

Sixth and Folsom. Plumbing, gas-fitting, etc.; owner, M. Israel; architects, Salfield & Kohlberg; signed, Nov. 26; filed, Nov. 30; cost $1060.

Valencia near 20th. Grading, chimneys, etc.; owner, Mrs. M. A. Rosekrans; architect, W. H. Lillie; contractors, Riley & Loane; signed, Nov. 25; filed, Nov. 27; cost $1695.

Valencia near 20th. Carpenter, mill work, etc.; owner, Mrs. M. A. Rosekrans; architect, W. H. Little; contractor, W. J. Fleid; signed, Nov. 25; filed, Nov. 27; cost $4200.

ESTABLISHED 1879. INCORPORATED 1889.
NOW IN THE SEVENTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

WE head our paper with different annual numerals and 1896 is now well under way. The stocks of goods which were produced in our busy years being now somewhat depleted after four years of non-production and the temper of the people being tried during that time to the utmost of their patience, the indications are that production will again proceed sometime during 1896, and after the general business has got a little headway, building will also commence to boom, and architects, contractors and building employes will again have all they can attend to. THE CALIFORNIA ARCHITECT AND BUILDING NEWS intends to be ready for such and will improve as the boom proceeds. We shall commence at once and with this number we issue four sheets of half-tones with other additional cuts and we intend with proper encouragement to increase the usefulness of our matter and the number of our plates.

We wish the profession generally, from British Columbia to California and from the Pacific to Utah, a prosperous year and more especially those who have stood by the only Architectural periodical of its class upon the Pacific slope and which hopes yet to have many a year of prosperity.

MR. H. T. Bestor's death, one time Editor of this paper, took place on the third of this month. He was sixty-one years old and one of the Pioneer Architects of San Francisco. In his later years he devoted himself a great deal to scientific research and belonged to several learned societies including the Chapter of Architects of which he was an active member. He was always willing to impart from his store of knowledge to the students, and they will miss him for he took a great interest in their classes and in their advancement.

IN A. Page Brown, whose death took place on the twentieth of this month, the profession has lost a brilliant member. The terrible injuries he received in the unfortunate accident that happened to him near Burlingham when driving a fast team, he never recovered from. During the short time of his activity in California, he was Architect for quite a large number of the principal new buildings of San

Francisco including the Crocker Building, the Ferry Depot Building, Donohoe Building, and the Manufacturers and Liberal Arts Building of the Midwinter Fair, besides a number of residences.

SUCH agitation as is now being made against the conditions of competition for the buildings for the Affiliated Colleges of the University of California, serves a useful purpose and will draw attention to the abnormal and absurd laws now on the Statute Book concerning the obtaining of plans for State work. They are better observed in the breach than in the keeping thereof, and so thought the Regents of the University for so far, in getting plans for their buildings, they have ignored these laws entirely and appointed their architects without regard thereto; until this last competition when the facts of such a Law was brought to their attention by the legal advisors of the State. Now that the impracticability and absurdity of the Law which was either drawn up by someone totally ignorant of the Status of an architect, or to fit some particular job at that time on the tapis so as to prevent all self-respecting and capable architects from competing, has been made apparent, let the Chapter of Architects and outside architects at once get together and see that such a disgraceful and unworkable law and one so derogatory to themselves is repealed at the first opportunity, and let them devise a better and proper one and get it past by the next Legislature.

In our next number we intend to go into this matter thoroughly and meanwhile invite any suggestions as to the proper kind of a bill to prepare.

THE Artistic public familiar with the grounds and buildings of the State University at Berkeley has long felt the inadequate treatment of these, as so far made, and often longed for some one in authority to take hold of the subject in a proper and broad spirit.

It seems at last we have such a one in Regent Reinstein, lately appointed to that office, who has taken hold of the subject in an energetic, broad and liberal way which is sure to lead to a successful issue. As an instance so as to get the best opinions on the best method of obtaining a complete scheme for said grounds and buildings he sends to all the prominent Architects and Presidents of Universities of America, a series of questions bearing upon the matter—from most of these he has received very painstaking replies.

By the courtesy of the Regent we have had an opportunity of looking over most of their replies and find therein an amount of interesting matter, not only worthy of consideration in this particular case but of general applicability to the architectural world.

We will record here the questions, a digest of the replies and lastly the lessons to be obtained from them.

First question was—

"The desirability and importance of beautiful grounds and surroundings, and buildings which will be both useful and convenient, and at the same time architecturally beautiful and arranged according to some general plan?"

It is a sad commentary on the State of Art Education among the people that such a question should have been necessary—but the present condition of many public grounds and buildings, point vividly to the necessity of impressing the desirability of such things upon those having charge.

It goes without saying that the replies are all thoroughly in favor of such a course—and we cannot refrain from quoting Regent Reinstein's own words in regard to the subject.

"Mr. Maybeck, instructor in architectural drawing has suggested the wisdom of at once setting aside a sum sufficient to obtain the services of the best landscape gardene and the greatest architect obtainable, who shall, within the coming year, and prior to the next session of the Legislature, lay out the permanent plan of the grounds and a general scheme of the buildings contemplated for all time, so that such grounds shall be as nearly ideally beautiful as may be, and that the buildings shall be convenient for use, architecturally fine in themselves and parts of a grand harmonious scheme which shall contemplate upon this, the noblest site on the earth, the most glorious architectural pile in history.

"Not built for a year nor for a hundred years, but for all time; not to rise, like Aladdin's palace, in a night, but during the slow centuries the University is destined to last. Believing as we all do in the great future of our State and her University, we hope it will not be necessary to have the authority of the presidents of the great universities and the best architects of the land to convince the people of the State of California of the wisdom of now laying out the plans of this already great University on a scale commensurate with the power, the pride and the dignity of a great and glorious state, and befitting the noblest and best purposes of a state. Let us build not rapidly, not lavishly, but slowly, yet grandly, that there may greet the commerce which shall whiten the Golden Gate and the civilization which shall grace this western shore an architectural pile of stately and glorious buildings, which shall rival the dreams of the builders of the Columbian Exposition, which shall do honor and justice to a superb Republic, and to its most favored State, and which, even in their ruins, shall strike the beholder with wonder and rapture."

The second item called for—

"Examples and experience, advantages and disadvantages of Competitive Plans in other structures of which you know?"

The replies to this range from the total condemnation of Competition by Mr. Sullivan to the modified approval thereof in certain cases.

However all condemn generally the idea of a competition and claim that better results are obtained by the appointment of some architect and landscape architect who has already shown his ability by practical work.

Mr. Sullivan of Chicago equals the most rabid socialist in his hatred of Competition—he puts his side of the case in strenuous language—towit:

"I regard the Competition idea as wholly fatuous and chimerical, I regard the assumption that you, I or anyone else can draw intelligent and just conclusions from a set of sketches submitted in Competition to be as false as it is specious and tempting. What you really want in an Architect-Artist is his individual power in grasp, imagination and expression: in other words his matured personality: and this is too complex, too subtile, too intangible a quantity to be discerned in anything but executed work: in a real performance.

"I know all that can be said in favor of the Competition idea: I have heard the arguments *ad nauseum:* each time they grow more revolting and grotesque in the semblage of truth

and each time they caricature still further an art too noble and serious to be thus degraded . . . Competitions I hold in contempt so great that I do not even wish to make an extended argument against them."

The consensus of experience among the other architects go to show that very few buildings whose architects were obtained by Competition have been successful. We might add also that no better results have been obtained where there has been no Competition and the choice of architect has been left to a public body when such choice has been made without professional guidance. It all depends upon this latter factor in either case, and this is the unanimous gist of the replies.

A great deal of prejudice against competition is due to those cases, of so called competition, which form the majority, where the architect has been first chosen by the public body and a form of Competition gone through afterwards simply to satisfy a Law or the clamors of outsiders.

THE DISADVANTAGES OF COMPETITION ARE STATED AS FOLLOWS:

First—"It would not be assured that the best man competed."—VAUX.

Second—"That at the time the first drawings are made neither the proprietors nor the architects have given the subject sufficient study to know what is advisable, and a competitive drawing is got up hurriedly, in a manner to catch the eye of the judges. The drawing is often used with the result of a very poor solution of the problem being worked out."—HENRY IVES COBB.

Third—"In choosing an Architect without Competition you can take into consideration the work which an Architect has done, his ability in construction and carrying out works, and his general character, and these questions cannot be so well considered in a Competition."—SHEPLEY, RUTAN & COOLIDGE.

THE ADVANTAGES OF COMPETITION ARE STATED AS FOLLOWS:

First—"They are certainly undeniable, if the Competition can be properly ordered."—VAN BRUNT & HOWE.

Second—"We believe that the best results will be obtained by inviting a certain number of architects of well-established ability and reputation to submit drawings and paying to them a fixed sum for their drawings; then allowing all other architects not so invited to compete if they so desire, and to provide for the latter a certain number of prizes for an inducement. In this way you will secure *all the advantages of a general competition* open to every one, and you will also have the assurance that the six or more men from whom you would wish to receive drawings in any event, will also furnish you with their ideas."—CARRÈRE & HASTINGS.

Third—"The most obvious advantage of a Competition is the opportunity thereby afforded to select and compare among a series of designs. Competitions are at best a cumbrous, costly and unscientific, though sometimes an unavoidable method of selecting an architect."—VAN BRUNT & HOWE, KANSAS.

From the above quotations and from the body of the letters it can be gathered that the general trend of opinions of the correspondents is that in many cases the choice of an architect without Competition is the most advisable, that is if the choice is made by the help of professional assistance. Although many of the writers admit that under *a properly conducted* Competition the most advantages can be obtained to the employer. It will be noticed that all the valid objections made against Competitions are not made so much against Competitions *per se*, but against *improper* Competitions, *e. g*:—Number One and Three disadvantages are answered by number Two advantage whereby the best man can be got to compete by paying him a proper remuneration.

Number Two disadvantage can be overcome by the adoption of the double Competition advocated by the editors of the *American Architect*, "that is to say, instead of holding one competition, it might be advisable to hold two, in which only those who have made the best showing in the first Competition should be invited to take part in the second one, and the actual employment of the winner in the second Competition should be positively assured."

So we see it all depends upon whether the Competition is conducted rightly or not.

The uncertainty of the professional minds on this subject simply indicates to us that we are now in a transitional period—the transition from Competition to Co-operation or Socialism. As we see the trade and manufactures of the world being fast aggregated into the hands of a few large firms—so in the profession of architecture—a few leading firms obtain the cream of the work—preparatory to having all enterprises placed into the hands of the people at large.

But as long as we are still in the Competitive stage—let us use it to our advantage and give talent a chance to be used where otherwise it would be lost; this can only be obtained by Competition in our present position, as this is the only way a man of talent and of no means or influence can hope to make himself known and appreciated.

The Third and Fourth questions as to the proper proportion of premiums to the moneys to the expended and as to the number and character of the premiums—is answered as follows by one correspondent:

Premiums to run from one-half to one and one-half per cent of the cost of the works according to magnitude, which agrees with the usual course, *i. e.*, to spend for premiums one per cent—the amount charged by architects for preliminary sketches.

In this particular case of Plans for a general scheme for University Grounds and Buildings—wherein $10,000 is proposed to be spent—it is suggested by one that each of the invited Competitors, say six, receive $1000 each—awarding two $1000 and two $500 prizes to outsiders and $1000 for expenses of Competition, expert fees, etc., which seems about the general idea.

In reply to the question "Whether the Competition should include foreign countries as well as the United States?" we agree with Lindley Johnson when he says "by all means let the world compete."

Learning is cosmopolitan, and the seats of learning should be the same. The lines between foreign and unforeign are being broken down fast in Architecture and are already broken down in Science. Let us not try to put up the fence again. Quite a few of the correspondents however advocate restricting the Competition to the United States—although they seem to us to give no adequate reason therefore.

The last question as to the data necessary to give Competitors a proper idea of the needs, in this particular case, is not of general interest so we will not enter into that matter.

We have attempted here to give a digest of the opinions on the above subjects, all but the subject of the proper conduction of a Competition, which is too wide a field to enter upon at this time—but to which we will draw attention again soon.

LETTERING.

ALTHOUGH in these days of typewriting and shorthand, Caligraphy has not the importance that it had some few years back and still less than it had before the advent of printing, it still forms an important adjunct to the artistic appearance of a plan. If badly done, it detracts much from a well executed drawing; if well done it makes a badly executed drawing pass, when otherwise it would be totally condemned.

It goes without saying, however, that no matter how careful a draftsman may be in making an artistic looking title, if he is without the idea of proportion and relative spaces he cannot make a complete success. It requires the artist to do this and he may not scientifically know that a curved letter of the same height as a straight lined letter looks smaller than it in consequence of some law of optics, but he knows it is so, and consequently makes his O taller than his E. So with spacing, he places his letters intuitively apart so that the space between all the letters shall be equal. Although this be so he does this with better grace after he has been through the drudgery of spacing by rule in his student days then he is sure of his ground because he goes to work intelligently.

Prof. Jacoby in his book on Lettering, reviewed in this number gives rules in regard to spacing and relative size of letters which seem to lead to a result as good as can be obtained by using rules—but the fact is that there are so many conditions entering into the relations of letters and their juxtaposition that it is impossible to limit them to any hard and fast Rule, and a good deal must be left to the natural sense of proportion of the draftsman. The modern use of typewriting wherein each letter occupies the same space should it be an M or an I spoils that nice sense of proportion to the modern, and an ordinary person gets his senses by this so warped that in despair, he flies to some rough and uncouth letters to cover his lack in this respect.

However we will not be far into the next century when we shall find the present system of longhand caligraphy almost totally abandoned and some system of shorthand substituted therefor, when it will be a problem for the next generation of draftsmen to make this stenography artistic and lovely looking. It do doubt can be done and the doing away with the fearful waste of time and labor now indicated by the use of longhand will be more than a complete recompense for any loss of æsthetic appearance.

By the begining of the twentieth century an agreement should be made between all nations as to the adoption of an universal shorthand Phonetic Alphabet, and immediately means taken for the gradual substitution of the old longhand by the new shorthand. The enormous economy in printers ink, paper, pens, etc., makes this an object worth working for by all those who are able to read and write.

Then will come the time when the poet may dash his thoughts down on paper before they can get cold, as the musician now jots down his notes. The bright thoughts will be as common as gold in Cripple Creek, and the litterateur and journalist may give up his midnight oil and get in all he wants by sunlight.

W. J. CUTHBERTSON.

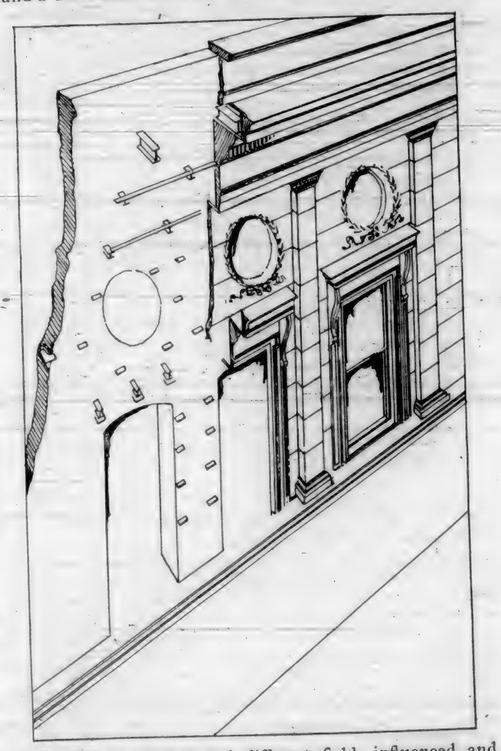
Subscribe for THE CALIFORNIA ARCHITECT AND BUILDING NEWS for the year '96.

PAPER READ BY JOHN COTTER PELTON BEFORE THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THIS paper is not prepared for the purpose of calling your attention to any particular form of released ashlar construction, but to the subject of released ashlar construction in its broad application to modern structures.

I feel that it is a subject in touch with modern thought and in line with modern constructional progress. I think that in our progress toward the attainment, with a minimum of material, of a superior result in effect that this form of construction may play some part.

I would not pull down the monumental memories of Greece and Rome, but may ask of you, shall we ever again build a Parthenon or a Colosseum. Are not our investigations now in another and different field, influenced and governed by totally different exigencies and sentiments.



The architectural world of 1895 is not the world before Christ, nor is the world of to-day, the world of to-morrow.

The day does not close, but sees at some fellow-craftsman's hands the improvement of a theory or the development of a better one.

I feel the sentiment in each subtle line of Grecian grace, the fragments of the Acropolis hill, tell me of the men who brought their work to such perfection, and they tell me of the spirit which was THERE influence, under which they lived and strove, but it was not the spirit which moves us of to-day.

I will confess to a profound awe in the study of the Parthenon or the Colosseum, as structures, but still I do not think while engaged in that study that any of us look forward to a commisson to build a Parthenon or a Colosseum.

The pyramids are inspiring. That simple, blind purpose, the piling np of stone upon stone, so herculean an accomplishment, as to try the patience in the development of a tenable theory of construction, work costing years of time, and the lives of thousands of human beings, and to obtain a receiving vault of limited size for the security of the remains of a King or his treasure, and I cannot doubt that from a point of security the Greeks would choose, to-day a modern safe deposite vault in preference to any of their temples.

But it quite idle to make these comparisons; let us ask each other, not are we rebuilding pyramids, or Parthenons, but are we building to-day, even as our masters built? Are we building just as we were ourselves building, only a few years ago?

I hardly believe that any of us would confess that ours is the only craft, not in the procession, which moves slowly but surely as the star of the empire, with that profound sentiment, that unconquorable purpose, *the improvement of the condition of man*. But rather may we not claim that through all ages, in architectural development will be found a certain and positive index of the condition of religions, social and commercial life.

The impellant idea which I have had in mind in the perfection of a method of safe construction of a thin ashlar facing for a structural wall, is the minimum use of the more *costly and beautiful materials, stone and marble*, an idea, originating possibly in the pryamids, and developing in the Latin countries early in the Christian Era. I have hardly had time or opportunity to trace the earlier applications of the idea. We need, I think, go no further back than the pyramids of Cheops, where, we may find the most positive and elaborate evidence, in heavy ashlar of black granite on the exterior, and of more rare and beautiful colored granites and porphyry in the interior passages, nor is it necessary to take up time in such an effort. We know that in the old world it is seen on every hand in many forms and degrees of thickness, frequently in the form of a mere veneering of inch marble.

St. Marcs in Venice, from sill to spires, is of rare and beautiful marbles, and I am sure no question will be raised of its permanency, although the application or method of attachment was most simple, done only by wiring and cementing, but rather I feel a question would have been raised by this economical race of people against the burying in walls of unnecessary thickness of costly stone.

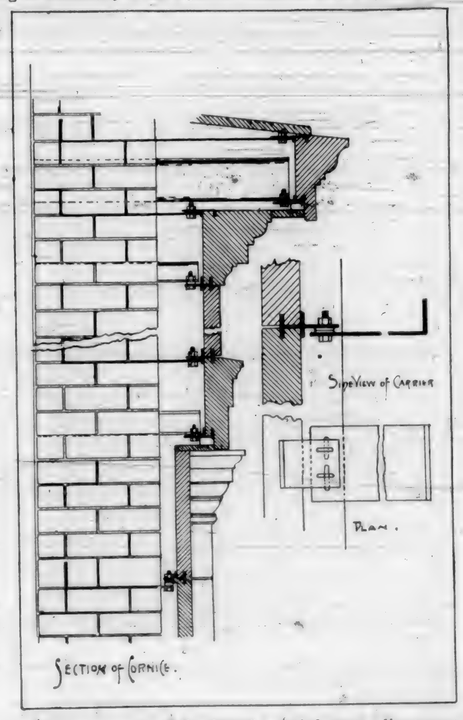
All along the Grand Canal in Venice, we find veneer construction from one to three inches in thickness of marble and sandstone in palaces, dating back as far as the Eight century.

The Milan Cathedral may be mentioned as a notable example of marble veneering. In parts of the bu lding, marble was used in heavy structural form, while later, from economical reasons, veneer construction on brick walls, was substituted, and the building so completed, and this, where marble is cheaper than in any part of the world.

Passing now the economical use of costly or choice material, I will attempt the substantiation of my conviction of the superiority of the released ashlar form of construction. To make this clearer, let us separate the necessary elements of a wall—strength, rigidity, fire resistance and architectural character.

Assuming the wall to be of proper construction being without connection structurally with the ashlar facing—it seems clear that it may be demonstrated to be more perfect than a wall of composite character, say than a wall of bonded brick and stone masonry. This means, of course, where there is limitation of cost and of occupied space.

I trust I shall not be severely criticized when I claim that a wall of given dimensions, carried to a considerable height, is a more reliable an certain construction if of solid brickwork of good character, than if of bonded brickwork and stone, by reason of the wide variation of the crushing resistance of brick and stone, and of brick and stone bonded together; and, also by reason of unevenness in settlement due to the greater number of mortar joints in the brickwork than in the stonework. The crushing resistance of brickwork, we may take at from 300 to 1000 lbs. per square inch; that of the ordinary sandstones of this coast varying according to authority from 1500 to 10,000 lbs. per square inch.



I submit to you the difficulty of a satisfactory adjustment of this variation of strength in a wall which is built as a unit, and I submit that if the adjustment is not perfect, that there can be no integrity in the wall.

I will not limit the comparison of the strength of a mixed brick and stone structure to the crushing resistance, but will risk criticism again in claiming a great degree of strength and permanence from any point of calculation for a wall of uniform material.

The California Hotel and Theater Building is an illustration to which I will refer, with some difference however, as I realize that to account for this error in construction, there must be several views and differing versions, but from no standpoint can the failure be made pardonable. There is

error in calculation, error in choice of material, error in adjustment of incumbent weight, or error in workmanship by stone cutter or by setter, and although I do not suggest the shirking of either question when circumstances demand such a structure, I do, without hesitation call your attention to the much more simple solution of each and every one of these features in the use of a wall of uniform material, *i. e.* brickwork and a released facing.

In question of rigidity in emergency, such as vibration caused by heavy traffic, or the more severe strain imposed by the shock of an earthquake, I believe that investigation will again reveal the superiority of this construction.

The settlement of a wall of brick or of masonry is one of the vital, if not most vital considerations of such work. This natural settlement or contraction has been estimated in average work to be sometimes as much as ¾ of an inch in ten feet in height, and every engineer, architect, superintendant of construction and builder, knows the care to be exercised in the construction of the parts of the work contingent upon such settlement, while the work is in progress. It does not require the consideration of a very high building to find this settlement to be of much moment. This settlement, if established that it exists, must be provided for somewhere or somehow. It cannot be ignored; if it exists, it must be traced in its effects or failure in some part of the structure is certain. If this be applied to a brick wall of even and defined strength, it is in itself serious; if applied to a wall of two different materials of differing strengths, it becomes worthy of most careful consideration. It must be admitted that the releasement of the facing absolutely solves this problem. The walls are carried to their full heights, almost the entire weight of the building is imposed, and the settlement or contraction has taken place before the ashlar is set.

The question of the prevention of dampness in walls of buildings of brick, or of brick and masonry has received your attention too often to require hardly a mention. I will confess to surprise but recently—in reading of the use of hollow bricks in the walls of the Parthenon, built 430 years before Christ. The reflection, therefore, that allowing the absorption of a common brick to be one pint of water that the walls of the Mills Building, in this City, might if exposed on all sides through their whole length might absorb no less than 420,000 gallons of water or 1680 tons, emboldens me to claim the overcoming of this fault of an ordinary wall as a third feature of advantage Sandstone of the average density is hardly less absorbant than brick.

I will ask here, if the exact computation of the parts and functions of the parts of a modern structure, this additional weight should be ignored? I fear it often is. We are all familiar with a number of expedients, of forms of construction, devices is wall anchors, etc., aimed at the releasement of the outer four inch facing of a brick wall, and for the purpose only of protecting the inner or structural wall from the accumulation or absorption of dampness, and I believe that within a few years, that this form of construction has been recognized as the most successful, in fact the only form certain of the accomplishment of the purpose.

By the provision of an air space, I cannot but feel convinced that much will be accomplished in the equalization of the temperatures, not only in the avoidance of the dangerous dampness, but a building so constructed cannot be so rapidly affected by the changes of temperature in the outside air. I submit that if this can be admitted, it is a consideration of importance in climates demanding the heating of buildings at great expense.

In the question of fire resisting qualities, I think I can again demonstrate superiority through the space of air between the structural wall and the ashlar facing, and suggest that until the outer facing has been destroyed and fallen off, the wall itself remains cool, and unaffected by the heat. With reference to the facing as a protection against fire, certainly much depends upon the selection of a material of superior fire resisting quality.

I may suggest in the event of a partial destruction by fire of a building so constructed, the possibility of making repairs without the total demolition of the wall, and here I will pass the reviews of the practical structional functions and will conclude with a few words on the resultant features of rapidity of construction and economy of proper area.

No general estimates can be made of either of these features—the amount of time which may be saved or of the saving of space occupied by walls—this will require special comparison. That such construction may be rapidly prosecuted is evident, the walls being carried to their full height without interruption, without being subject to delay in the preparation of the material for the facade, in which, whether of brick and terra cotta, or brick and stone, may usually be found the cause of delay, consequent upon its more elaborate character and the slower process of ordinary construction, the building being under roof and inclosed, the prosecution of the work of the interior is made entirely independent, and may be begun at a much earlier period.

Continued in February number.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

ANNUAL SUMMARY OF BUILDING OPERATIONS.

IN the following table we present the number and value of buildings erected in San Francisco during the past year, as shown by the contracts filed at the City Hall.

FOR FIRST SIX MONTHS.—1895.

1895	No. of Buildings	No. of Contracts	Brick Building Value	No. of Buildings	No. of Contracts	Frame Building Value.	No. of Buildings	No. of Contracts	Alterations & Addit'ns Value.	No. of Buildings	No. of Contracts	Total Value.
Jan'ry	2	3	$ 50,025	31	33	$ 148,880	4	4	$ 20,847	37	40	$ 219,752
Feb'ry	7	9	59,336	38	42	122,880	6	6	12,071	51	57	194,287
March	6	9	170,489	76	81	208,081	8	11	17,418	90	101	395,988
April	7	9	105,333	57	09	274,080	24	24	87,411	88	102	466,824
May	3	7	86,043	85	90	393,037	19	19	33,973	107	116	463,053
June	2	5	74,775	67	85	288,791	11	11	21,612	80	101	385,178
Total	27	42	$ 496,001	354	400	$1,435,749	72	75	$193,332	453	517	$2,125,082

FOR SECOND SIX MONTHS.—1895.

1895	No. of Buildings	No. of Contracts	Brick Building Value.	No. of Buildings	No. of Contracts	Frame Building Value.	No. of Buildings	No. of Contracts	Alterations & Additions Value.	No. of Buildings	No. of Contracts	Total Value
July	11	17	$ 151,362	84	90	$ 287,947	15	17	$ 162,263	110	124	$ 601,572

COMPETITION.

ANNUAL COMPETITION FOR THE GOLD AND SILVER MEDALS OF THE ARCHITECTURAL LEAGUE IN CONNECTION WITH THE ANNUAL EXHIBITION OF THE ARCHITECTURAL LEAGUE OF NEW YORK.

CONDITIONS FIRST:—The Competitors must be residents of the United States, and under the age of twenty-five.

SECOND:—The drawings shall be made in conformity with the following programme, and entirely by the hands of the Competitor.

The awards will be made by the Committee on Competition and Awards acting as a Jury, and their decision will be rendered on or before February 13, 1896.

The competitive drawings will be hung at the Exhibition, the first and second prize drawings being so indicated, and these latter shall become the property of the League.

PROGRAMME—THE PRINCIPAL ENTRANCE OF A TERMINAL RAILROAD STATION.

The station is located at the junction of three main streets of a city of first importance, in a "rond point," the principal entrance facing one of them, and the station property being bordered by the continuation of the other two.

The line of the building is set well back from the street, giving ample space for driveways arranged so as to accentuate the entrance, steps, etc., for travelers arriving on foot. The main floor of vestibule must be located at about grade level. The length of front over all, as shown on diagram, is 200 feet. The cost is left to the discretion of the designer.

Only the entrance with preceding driveways, ramps, etc., with indication of main vestibule, shall be shown on plan and elevation.

The drawings will be placed on two sheets 26" by 39"; one sheet containing a section and elevation at ⅛" scale and plan at 1-16" the other a ¾" scale detail, with cast and rendered shadows.

All drawings are to be delivered flat, under a non-de-plume, on or before February 6, 1896, at the League Rooms; charges prepaid.

COMMITTEE: JOHN GALEN HOWARD, ALBERT L. BROCKWAY, THOMAS HASTINGS, Chairman.

NOTES AND COMMENTS

THE GUILD OF ARTS AND CRAFTS.—The interesting exhibition of Books and Printing under the auspices of the Guild of Arts and Crafts is open to the public at 424 Pine street.

OAKLAND'S EXPOSITION.—Oakland has just closed one of the most successful Expositions on record. Gotten up only in three weeks it was engineered by good business men and was not only successful in a pecuniary sense but was in the way of exhibits an exhibition of the enterprise and capacity of Oakland and its environs which surprised all that had the privilege of seeing it. It was successful in every way and has given such a stimulus to Oakland and its business interests that its managers have decided to make a permanent affair of it and will soon get to work to make a permanent building for all such occasions as have just past.

The directors of the concern were:—M. J. W. Nelson, M. J. Keller, Geo. Roeth, Theo. Gier, Fred Becker, Ely Buswell, F. W. Spiars and Wm. Rutherford; Craigie Sharp, Superintendent.

STUDENTS NOTICES.—Mathematical class of Mechanics' Institute, 31 Post street, San Francisco. Sessions: Tuesday and Friday evenings, 7:30–9:30 P. M. New term begins January 6 and ends June 27, 1896. Studies: Algebra, Geometry, Trigonometry. 2 The applicationof Mathematical principles and rules to the solution of problems in mechanics, electricity and advanced commercial calculations.

Any student is permitted to make such selections from the above list of studies as he may consider profitable and useful for himself. Students desiring it, will be given an opportunity to review and extend their knowledge of arithmetic and to learn how to apply its rules to practical examples in mensuration of plane and solid geometry.

For further information apply to the Instructor in charge of the class.

BOOKS AND PERIODICALS.

A text book of PLAIN LETTERING by Henry S. Jacoby Ass. Prof. of C. E. in Cornell University.

This book will be found quite a help to draftsmen. It goes thoroughly into the methods of artistic and scientific letter making—and is not cumbered with the large amount of so-called ornamental lettering which compose the major portion of old fashioned works on this subject. It is welcome if only for the indication it gives of the adoption by the modern draftsman of plain readable letters instead of the almost undecipherable lettering which used to abound on Architectural Drawings.

The BROCHURE Series of Architectural Illustrations—published monthly by Bates & Guild—has every month a very useful and excellent series of half tones of Architectural Subjects of use to the architect and draftsman.

LIPPINCOTT'S for January among other good things has an article on "Architecture in America: a Forecast" by John Stewardson, the first of a series of papers on a subject which now holds a prominent place in public interest—and so far seems well and justly handled by the author.

The following critism on the present rage for tall buildings seems *a propos*:

If we look at the business buildings of Europe and America we find a difference just as striking as in private houses. In England the buildings are not very high, and are cut up into a multitude of small parts following the same styles that are used in country houses. There is little breadth of treatment, little grasping of what is known as the *grand parti*. On the Continent we find the style of the period used for business buildings as well as for everything else. The treatment is broad but monotonous. The buildings are generally studied as a whole, well planned and well proportioned. There interest ceases, the detail being, as a rule, crude and unfeeling, in this respect materially different from that across the Channel. As for business buildings in this country, all the world knows what they are. There is very little good architecture about them, but a great deal of good engineering. Just now it is very much the fashion to praise the huge steel cages with their walls carried on the beams from floor to floor and the weight concentrated into a few vertical shafts, and they are unquestionably admirably adapted to their purpose, but, with very few exceptions, they are not architecture. There is not much more architecture in building a tiresomely long row of offices or apartments, all of exactly the same height and all devoid of any kind of treatment, one above the other, then there is in placing them side by side like any row of brick buildings. Indeed, the architects of some office buildings are men who have never given thought to the principles of proportion, though of course it would be most unjust to the architects of the greater number not to acknowledge the ingenuity and skill with which they have grappled with an entirely new problem; while as for the structural iron-work, it is often as good as can be imagined. From an architectural point of view the greatest drawback to these disproportionate structures—and it is a very serious one indeed—is the fact that they dwarf public buildings, churches, and everything of a monumental character around them, utterly destroying restfulness and scale and marring the general appearance of a city beyond repair. * *

The phenomenal amount of youngmen now turning their attention to architecture as a means of livelihood is remarkable and is alluded to in the following extract. The author however gives no indication as to what shall be done with these students when they become full blown architects:

"Lawyers and doctors tell us there are so many law and medical students that the professions will be scandalously overcrowded in the next few years. Painters deplore the swarms of ambitious young men in the studios, and assure us there will be no room for them in the future. As for writers, they lament about the overstocked condition of the literary market until one is quite tired of hearing about it.

It is therefore with some trepidation that I make the easily substantiated statement that the increase in the number of students in these callings is small compared with their increase in that of architecture. About fifteen years ago, for instance, there were sometimes half a dozen Americans studying in Paris, sometimes one. For the last five years there have been from forty to sixty, while Americans have been frequenting, besides, the schools of Berlin, Vienna, Florence and Rome. To take an example nearer home, six years ago the long-established School of Architecture of the University of Pennsylvania contained two students: this year there are over a hundred; and so it goes, from the Atlantic to the Pacific. Moreover, this increase in numbers does not include the men who are getting their training in offices without going to the technical school at all. * * * *

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

ESTOPPEL TO DENY VALIDITY OF BOND.—Where a bond given to discharge a mechanic's lien is treated as valid by all the parties, and the lien is discharged, a surety cannot, in an action on the bond, deny its validity.

Moller v. Youmans, Common Pleas of New York City and County, General Term. 34 N. Y. S. Rep. 140.

VENUE IN MECHANIC'S LIEN CASES.—Under Pub. St. c. 191 sec. 11, providing that a mechanic's lien may be enforced in a district court, the petition must be to the court within whose jurisdiction the land lies, irrespective of the residence of the parties; and the only effect thereon of St. 1893, c. 396, revising and consolidating the laws relating to district and police courts, was to increase the amount within which the latter courts have jurisdiction.

Boyle v. Gould, Supreme Judicial Court of Mass. 41 N. E. Rep. 114.

MECHANIC'S LIEN—ENFORCEMENT.—Under the statute, giving a mechanic's lien upon the building to workmen, which they had had helped to erect, "and upon the interest of the owner in the lot of land upon which the same is situated," a lien cannot, at the option of the holder, be established on a part only of the whole lot.

Whalen v. Collins, Supreme Judicial Court of Mass., 41 N. E. Rep. 124.

WHAT CONSTITUTES SAFE PLACE FOR SERVANT TO WORK.—A heavy piece of flooring, standing on edge near the place where men were working, was supported as could be plainly seen, by other pieces. The contractor placed a sufficient number of competent men at work moving the flooring and puting it in place. They removed the supporting piece first, and the other piece fell on and killed one of the men. The contractor was not chargeable with negligence in not providing a safe place for him to work.

Smith v. Empire Transp. Co., Supreme Court of N. Y., 35 N. Y. Supp. 534.

CONTRACTS IN RESTRAINT OF TRADE.—An agreement by the members of a national association of master plumbers to withdraw their patronage from any dealer selling supplies to others than master plumbers is not unlawful, even though "master plumbers" be construed to mean members of such association.

Macauley v. Tierny, Supreme Court of R. I., 133 At. Rep. 1.

SIXTH WARD SCHOOL, OAKLAND.

THIS School House lately completed is situated at the corner of Fourth and Harrison streets, Oakland. It is a four room school with ten foot basement, of brick and stone. The basement contains play rooms for the children in wet weather, water closets and the heating furnaces. Exclusive of the four class rooms, the building contains a principal's room, store room, lunch room and kitchen.

The Architect was W. J. Cuthbertson, the superintendent W. Hopkirk and the whole was under the charge of the Oakland Board of Public Works consisting of Mayor Davie, City Attorney Piersol and City Engineer Wilson, and carried out to the satisfaction of the school board, Mr. Ford the School Director for the ward in which the building is situated, giving the matter a good deal of personal attention. The total cost of the building was $35,000.

The Brick work was carried out by the well known and old established firm of Remillard Brick Co., of Clay and Second streets, Oakland. The fronts were faced with their stock brick which, when pointed up with red cement and cleaned down, makes a brick front which leaves nothing to be desired.

The Carpenter work was done substantially, conscientiously and carefully by R. Weeks & Son who have made a good reputation for themselves since they have settled in Oakland; they have been particularly successful in school house work, having only a short time ago completed the Redwood City High School. Besides their work in Oakland, Alameda and Berkeley they can also point with pride to the following work done by them in other parts of the Continent—Garfield University at Wichita, Kansas, costing $270,000; Clements' Block in the same town and several large residences. Mr. Weeks is a man thoroughly experienced in his business and thoroughly reliable. The firm has lately opened a shop in the Turn Verein Building on Webster street near Seventh, Oakland.

The inside finish of the building is of white cedar and was put up by the above in a manner worthy of the way in which it was worked by Burnham, Standeford & Co., the old established firm of millmen, running the Pioneer Oakland Planing Mills, situated on First, Second and Washington streets, Oakland. The finish was thoroughly seasoned in their Patent Lumber Dryer—which is built on the latest improved method. The heat is introduced by pipes under the open floor, the hot air is circulated and regulated by an arrangement of flues and dampers—the moisture as it is driven out of the lumber is condensed on brass plates which form the outside enclosure of the dry houses. The drops of water descend and are caught in a gutter and carried to outside of building. In seven days the stock is thoroughly dry and by this system of drying the sap is solidified so that no shrinking nor swelling is possible and is the only process that successfully kiln drys redwood without checking, crystallizing or case harding. The capacity of the dry house is 15,000 feet and it cost $1500 to put up. It has now been in use nine months and it is found to work most successfully both for hard and soft wood.

Over the kiln is placed the veneering room, kept at a proper temperature where all the gluing and veneering is done. It is fitted up with presses for gluing veneer and everything complete, so that this firm is able without dispute to get out work equal to any of the Eastern houses both in dryness and finish.

The Lumber was supplied by the Puget Sound Lumber Company whose extensive yards and wharf are situated at the foot of Washington street, Oakland, where there can always be found a large assortment of well seasoned lumber such as went into the School House.

The stone work, of which there is quite an amount in the shape of cornices, copings, columns and arches, trimmings and quoins was executed by James Rea. All but the columns is finished in "rock face" and all is carried out in such a manner that any laudation seems superogatory. The Romanesque ornament of the freezes of the cornices, the capitals and other carved work are executed in the best manner of that art, and leave very little to be desired. Mr. Rea also carried out the stone work of the Oakland Gas Company's Office Building and the Native Son's Hall, Delmonico's and interior of Church of the Advent, etc., in San Francisco. The firm is now incorporated under the name os the Rae Building and Contracting Co., Jas. Rae, President; stone yard Seventh and Townsend St, San Francisco.

The painting and polishing is carried out by Messrs. Doody & Hooley. "Good wine needs no bush," and this old established firm needs no puff. All the interior cedar finish was done in natural finish, and Doody & Hooley by using the best materials and good workmen have made a thorough success of its appearance, and the owners have the satisfaction of knowing that a good job of mill work was not spoilt by a poor job of polishing, and the painters have the satisfaction of knowing that this job is not hurting the reputation which they have maintained in Oakland and vicinity ever since 1865. It may be mentioned *en passant* that Miles Doody the senior partner, gave evidence while he held the position of Assistant Engineer of the Fire Department that he made as good a fireman as he did a painter and we presume that is the way with him whatever he takes hold of. The firm has done so much good and well known work scattered around Oakland and its vicinity, that if would be useless to attempt to particularize so we will not attempt to enumerate.

The building is completely equipped with electric bells, speaking tubes, etc. Every class room is connected by these means with the principal's room. All this work has been thoroughly installed by J. A. McCarl & Co. of 365 Twelfth street, Oakland—whose reputation is such that he controls a large electrical business as well as a very successful business in steam and hot water heating, galvinized iron work, tin work, locksmithing and cognate branches. This firm installed the most complete return call system on the Coast in the Redwood City School House and intalled electric systems in Judge Lair Hill's residence at Berkeley, Geo. Garrett's on Oakland Heights and other large residences.

The Plaster Decoration was ably carried out by Jno. Conley of 362 Ninth street, Oakland, who has now taken the front rank in Oakland for that kind of work, as witness the Diploma he has just received from the Oakland Midwinter Exposition of 1895, for the best exhibit of Plaster Decoration. The elaborate outside decoration in plaster of the

Porter School House in Alameda, consisting of panels, medallions and figure decoration is a monument to Mr. Conley's ability in that line, the style showing that he only employs the best artists and modellers. He is now supplying the Reed Building on Clay between Eleventh and Tenth with ornamental plaster work, and has also a large clientage in San Francisco.

The gutters of the roof are all of copper which was laid in his usual thorough manner by Philip Hammond whose shop is at 318 Larkin street, San Francisco, to which lately he has made considerable addition to accomodate his increasing business and the Oakland Metal Works which he has now combined with his city shop. The galvanized iron balcony on the front of the building used to obtain access to the flag pole—and its ornamental balustrade was carried out artistically and adds to emphasize the central feature of the front facade of the building. Mr. Hammond is now employed on the copper and lead work for the large residence for Mr. Spreckles on Van Ness Ave., and has completed satisfactorily the work on the two Spreckels' Buildings on Market street, San Francisco.

The plumbing work is all first-class, exposed work and together with the complete and extensive system of sewerage was done by the old established firm of Dalziel & Moller, a firm which has grown up with the town. Their work was entirely satisfactory, as much so as in the New City Hall of Alameda, another public building upon which they have lately been engaged. Dalziel & Moller have a large establishment in San Francisco which they confine entirely to wholesale plumbing goods and where they succeed in keeping the confidence of the plumbers and gasfitters of the State and keep a full stock of goods requisite for their business. The Oakland shop is at the corner of Thirteenth and Broadway, and the San Francisco one at 554 Mission street.

Special attention has been given to the system of warming and ventilating, the crowing feature of which is to furnish a continuous supply of fresh air. The system in this building has been installed in a systematic and compact way and without making projections or angles in class rooms.

The minimum capacity of the plan, as shown by a test, makes a complete change of air in the rooms from four to five times an hour, while the maximum capacity, as shown by air meter, was over 2,000 feet of air supply per minute, or an equivalent to over eight changes of air in room per hour. Tests as to the uniformity of the heat, the ease of management and economy in fuel has exceeded the Guarantee of the company, making a most successful and economical combination. The sanitary closet system in the basement of the building is a valuable feature, both from its freedom from disagreeable odors and its automatic operations. As a result of the successful working of this system, the company are now executing contracts from Pasadena, California, to Portland, Oregon. The following partial list of buildings show where the heating and ventilating or sanitary flushing closets have been introduced within the last year or is now being introduced:

San Francisco, Cal.—Haight Street School, Richmond School, Sutro School, Douglass School; Pasadena, Cal.; Watsonville, Cal.; Redwood City, Cal.; Alameda, Cal.; Redding, Cal.; Medford, Ore.; Marshfield, Ore.; Portland, Ore.

"LITTLE JIM" WING OF CHILDRENS' HOSPITAL.

THE funds for building the "Little Jim" wing of the Childrens' Hospital were collected during Christmas week 1894. The school children throughout the State with their entertainments and contributions and a committee of ladies who published the Christmas *Examiner* were the chief agents in getting the necessary money. The papers sales and advertisements cleared nearly $13,000, and the sums brought in from other sources netted an equal amount. The money was banked by *The Examiner* and a check for the total was made payable to the order of the Lady Managers of the Childrens' Hospital and Training School for nurses.

As soon as practicable thereafter designs for the new building were drawn by architect Schweinfurth who made a careful study of all the plans of the latest hospitals in Europe and America. Then he endeavored to embody all their best points in the plans of the "Little Jim ward. It has all the latest appliances and conveniences in a hospital way.

December twenty-first last the building was dedicated with appropriated ceremonies and formally turned over to the Board of Managers of the Childrens' Hospital.

Thos. Butler did all the work on the building, outside of the plumbing. Mr. Butler has been identified in his long career with a large number of the most important buildings in San Francisco and is at present enployed on the Grose Building on Mission near Main streets and the Annex to the Park Museum.

The plumbing which of necessity was required to be of the best was done by W F. Wilson of 104 Stockton street, San Francisco. It is all open work; the bath tubs are Mott's movable, porcelain, rolled rims and are mounted on iron rollers with rubber tires so that they can be rolled alongside the bed of the little sufferer and used there. In the floor of the lavatory, which is all of marble including partitions, is a cesspool connected with a waste for the purpose of emptying the tubs. The heating is done by one of Mott's Hot Water Heaters. Mr. Wilson has in charge the plumbing for the Claus Spreckels' residence.

RESIDENCE FOR EDWARD COLEMAN, ESQ.

THE fine residence on the corner of California and Franklin streets, lately completed, is a frame building with a concrete basement in the Colonial style, and cost about $30,000—W. H. Lillie is the architect.

In the basement, which has a cement floor all over, are the heating rooms, fuel rooms and other rooms which usually go in a basement. The first floor contains a study, parlor, sitting and dining rooms and kitchen and appurtenances with spacious halls. The second floor contains five bed rooms with private baths and the attic five bed rooms.

The first floor is finished in oak and mahogany except the parlor which is in cream and gold. The entrance vestibule and doors are of oak—and there is a fine flight of marble steps leading to the same. The cove of the parlor is in ornamental plaster work and hall and dining room have oak beam ceilings.

The general contract was executed by Messrs. Farrell & Bell, one of the oldest firms of builders in the State, having been established in 1853, and ever since keeping up an unsurpassed record for good and honest work. They are equally at home on solid brick buildings and on fine residences. Of the first class they can point to the Odd Fellows Hall Building, Heller Building on Sansome street, etc.,

and of the latter to the residence of Wm. H. Howard at San Mateo and the residences of the Schwabacker Bros., Henry E. Bothin, A. P. Hotaling, J. C. Coleman and others of San Francisco, and this building, their latest, shows equally bestowed upon it the same care and knowledge displayed in their former achievements.

L. B. Sibley did the grading of the lot of which there was considerable, costing over $800, and there is nothing in his line of business that he is not prepared to do from large to small and in a workmanlike manner. He is one of the directors of the Builders' Exchange.

All the concrete work including the concrete basement walls which are lined and molded in imitation of rock face stone, was done by Mr. Goodman of Nevada Block, the character of whose work is too well known to need any laudation.

The painting and polishing was done by J. P. Fraser who is celebrated for fine work in his line. The work here is done in his usual first class manner—the oak and mahogany work being so finished and polished that not only is the appearance good but its lasting capabilities is without question. Mr. Fraser having done the work on most of the large residences and buildings in San Francisco it is useless to try to enumerate them, but they are all lasting records of his skill in his art.

The electric work, consisting of a complete system of incandescent lighting, electric gas lighting and electric bells was installed by the Will & Finck Co., the well-known firm of electrical contractors. One of the principal features of the installation is the use of the Sechrist Automatic Switch whereby the Incandescent lights are operated from a nickel plated press key of the same kind and style as for electric gas lighting. Another feature is a double system of annunciators whereby a call from any part of the house is indicated simultaneously in the kitchen and in the servants' quarters in attic. The neat and workmanlike manner in which the contract has been carried out reflects great credit on the Will & Fink Co. We may mention that they are now installing the extensive electric work of the new Safe Deposit Building.

The plumbing of the house is one of the most complete and modern; all the bath tubs are Mott's Porcelain Rolled Rim Tubs, and are supplied with instantaneous water heaters—all the washstands and baths have shampoo attachments and so on throughout the whole job. The work was done in satisfactory style by Harry Williamson of 413 Sutter street.

The Heating apparatus was installed by W. W. Montague & Co., and their "Commander" Heater used. It is needless to say that their name is sufficient guarantee of the capacity and long livelyhood of their heating arrangements. They also supplied some of the artistic mantels in the house and in this regard it may be said that it is questionable whether the stock of fine mantels on exhibition at their show rooms, 309–317 Market street can be equalled on the Coast.

The three large stained glass windows lighting the staircase were designed and manufactured by Hausmann Bros. They cover a surface of seventy square feet and are designed in the modern Rococo style now so much in vogue in the East, replete with tender tints and delicate effects—the ornamental part entirely in cut glass. The centre panel is a floral piece with a bulrush motif, richly shaded.

Mr. S. Kellett of 28 Ellis street carried out the Plaster Decoration.

BUSINESS MOSAICS.

The Selby Smelting and Lead Company has furnished to R. A. Vance, for use in the Parrott Building, a large number of three inch and four inch lead traps and bends in regular and heavy weights, these goods are drawn on a new hydraulic press, lately imported and in use in their works at First and Howard streets, and are much superior to those which are cast from iron or brass as the lead is compressed *solid* and is perfectly smooth while brass and iron may have pin or blow holes and the inner surface of the brass or iron when cast is rough and catches and retains the filth, whereas, the lead being smooth as a mirror, flushes out and makes a sanitary fixture; special lengths and extra weights drawn to order.

Joseph Budde commenced '96 with an original Calendar in which a beautiful female about to strip for the bath is placed in juxtaposition with his latest No. 1 Cyclone Water Closet—hyperbolically indicating thereby that that sanitary appliance keeps as sweet and clean as its neighbor aforesaid. Anyone that can conceive such beautiful relations deserves recognition on all sides. Another calendar from the same firm represents an innocent child wraped up in her bathing robe just coming from the bath. We suppose typical of the innocency of any obnoxious gases of the adjacent Jos. Budde's No. 1 Cyclone.

A Steiger Sons—Architectural Terra Cotta can be ordered from their San Jose office as well as from the main office in San Francisco, 206 Market street. Remember that as well as Architectural work, this firm can supply anything in the way of stone-ware, such as flower pots, sewer pipes, and an endless varity of goods in this line.

The San Francisco Lumber Co., wholesale and retail; principal office foot of Third street, uptown office 405 Montgomery street corner of California. Mr. J. N. Curtis, manager. This firm is almost sure to be able to supply anything in the way of lumber that you may require.

Facts about anything are what we all want—but facts about paints, are of interest not only to the householder but to the contractors and builders in general.

Don't forget that by applying to W. P. Fuller & Co., you can receive facts about paint, but a guarantee of absolutely pure and satisfactory paint. See their advertisement on the last page of this Journal.

Those in want of the best window cord should order Samson Spot Cord, if you are in doubt, order sample from Samson Cordage Work, 115 Congress street, Boston, Mass.

CITY BUILDING NEWS.

Baker near Page. Two-story and basement; owner, B. Griffin; architect, V. Krolow; contractors, Williams & Foster; signed, Dec. 20; filed, Dec. 21; cost $4100.

Brannan and Langton. Two-story frame; owner, R. P. Merillion; contractor, W. W. Redmall; signed, Dec. 19; filed, Dec. 19; cost $4485.

Bryant and 5th. Two-story brick, mason work; owners, Main & Winchester; architect, Henry Geilfuss; contractors, Miller & Peck; signed, Dec. 20; filed, Dec. 23; cost $3949.

Bryant and 5th. Two-story brick, carpenter work; owners, Main & Winchester; architect, H. Geilfuss; contractor, C. Schutt; signed, Dec. 20; filed, Dec. 23; cost $4875.

Bryant and 5th. Two-story brick, grading, etc.; owners, Main & Winchester; architect, H. Geilfuss; contractor, I. M. Zimmermann; signed, Dec. 20; filed, Dec. 23; cost $1925.

Broadway near Steiner. Alterations and additions; owner, W. F. Herrin; architect, J. E. Krafft; contractor, R. Currie; signed, Dec. 18; filed, Dec. 23; cost $2260.

Bush near Scott. Two-story frame; owner, Philip Thorn; architect, H. D. Mitchell; contractor, Ed. Ginley; signed, Jan. 6; filed, Jan. 7; cost $6215.

Bush near Kearny. Alterations and additions; owner, Estate of Wm. Shiels; architect, A. J. Barnett; contractor, Wm. Little; cost $4085.

California near Laurel. Two-story frame; owner, G. V. Daniels; contractor, A. Dahlberg; signed, Dec. 27; filed, Dec. 27; cost $2515.

Clement near 5th Ave. Frame dwelling; owner, J. King; contractor, A. Jackson; cost $2500.

Charles and French. Steel bridge; owners, City of San Francisco and C. P. R. R. contractors, Henley, Tibbetts & Co.; cost $5500.

Cliff House. Additions to sheds; owner, Adolph Sutro; architect, J. C. Colley. contractors, Campbell & Pettus; signed, Jan. 3; filed, Jan. 4; cost $3156.

Dolores near 14th. Two-story frame; owner, F. B. Hulting; architects, Martens & Coffey; contractors, Reit & Ahlgren; signed, Dec. 23; filed, Dec. 28; cost $2875.

Fell near Ashbury. Two-story and basement; owner, John H. Brising; architects, Martens & Coffey; contractor, C. Schutt; signed, Dec. 26; filed, Dec. 26; cost $3950.

Fell near Ashbury. Two-story frame; owner, Henry Bohls; architects, Martens & Coffey; contractor, C. Schutt; signed, Dec. 26; filed, Dec. 26; cost $5960;

Francis near Mission. Cottage; owner, Bertha Wolch; contractor, James McConchey; signed, Jan. 3; filed, Jan. 4; cost $1150.

Fourth near Clement. Cottage; owner, J. C. Coggin; contractor, E. Ginley; cost $2500.

Fulton near Devisadero. To build; owner, Mrs. Pauline Casner; architect, W. Koenig; contractor, W. H. Kinread; signed, Dec. 17; filed, Dec. 18; cost $3050.

Golden Gate Ave. and Pierce. Alterations and additions; owner, Mrs. Elizabeth J. Hulme; architect, C. J. I. Devlin; contractor, Ralph Carey; signed, Dec. 12; filed, Dec. 17; cost $1925.

Golden Gate Park. Annex to Museum; owners, Park Commissioners; architect, E. R. Swain; mason work, T. Butler; $6000; iron work, Pacific Rolling Mills, $1927.

Hampshire near 22d. Cottage; owner, H. Feige; cost $1500.

Hardy near 16th. Additions and alterations; contractor, Mr. Hayes; cost $1000.

Hyde near Eddy. Three-story frame; owner, Fannie Cohen; architect, A. J. Barnett; contractor, Joseph Kemp; signed, Dec. 14; filed, Dec. 14; cost $5645.

Hyde near Eddy. Three-story frame; owner, Fannie Cohen; architect, A. J. Barnett; contractor, Jos. Kemp; signed, Dec. 14; filed, Dec. 14; cost $5645.

Jackson and Larkin. Three-story and basement; owner, Mary M. Gagan; architects, Shea & Shea; contractor, John J. O'Brien; signed, Dec. 12; filed, Dec. 14; cost $6817.

Kearny and Post. Alterations; owner, Weil & Co.; cost $2500.

Lake Merced. Construction of a shaft; owner, Spring Valley Water Works; architect, F. A. Schussler; contractor, A. E. Buckman; signed, Jan. 7; filed, Jan. 11; bond $500.

Lott near Height. To build; owner, Margeretta J. Wigg; architect, W. H. Lillie; contractor, Jas. McLean; signed, Jan. 14; filed, Jan. 15; cost $3374.

Market near 5th. Fixtures, etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, S. F. Furniture Mnfg Co.; signed, Dec. 11; filed, Dec. 17; cost $6076.

Market near 5th. Hardware, doors, etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, F. W. Kern; signed, Dec. 12; filed, Dec. 17; cost $29,450.

Market near 5th. Fire hose, etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, New York Belting and Packing Co.; signed, Dec. 19; filed, Dec. 20; cost $1927.

Market and Third. Sustaining division wall; owner, Claus Spreckles; contractor, J. S. Stratton; cost $4000.

Masonic Ave. near Waller. Two-story frame; owner, Annie G. Coffey; architects, Martens & Coffey; contractor, W. A. Miller; signed, Jan. 11; filed, Jan. 11; cost $3409.

Noe and Henry. Additions; owner, Mrs. L. Boger; architect, W. H. Armitage; contractor, L. B. Schmid; signed, Dec. 16; filed, Dec. 18; cost $2500.

Oak and Baker. Carpenter work on two-story brick and stone; owner, Howard Presbyterian Chapel Society; architects, Percy & Hamilton; contractor, E. L. Brooks; signed, Jan. 3; filed, Jan. 4; cost $6780.

Oak and Baker. Concrete, brick andd stone work, etc.; owner, Howard Presbyterian Chapel Society; architects, Percy & Hamilton; contractors, Gilmore & McNinch; signed, Dec. 31; filed, Jan. 4; cost $4820.

Oak and Lyon. Repairs to partly burnt building; owner, Eugene C. Owles per Columbus S. & L. Society; contractor, G. Massoletti & Son; signed, Dec. 13; filed, Dec. 14; cost $1995.

Phelan Building. Alterations to front entrance; architect, Wm. Curlett; cost $3000.

Post near Larkin. One three-story frame eight flats and two two-story frames six flats; owners, G. Berson & A. Calleau; architects, W. Mooser & Son; contractor, J. F. Logan; signed, Dec. 27; filed, Dec. 31; cost $23,750.

Post near Larkin. Plumbing and gas fixtures; owners, G. Berson & Armand, Calleau; architects, W. Mooser & Son; contractor, R. Rice; signed, Dec. 27; filed, Dec. 31; cost $2905. Painting and varnishing; W. Barton; cost $1775.

Powell and Market. Marble wainscoting; owner, E. J. Baldwin; architects, Percy & Hamilton; contractor, Vermont Marble Co.; signed, Jan. 3; filed, Jan. 7; cost about $2460.

Sacramento near Webster. Painting and graining; owner, Jacob Rosenberg; architect, C. C. McDougall; contractor, D. Zelinsky; signed, Jan. 3; filed Jan. 3; cost $1300.

Second Ave. near California. One-story frame; owner, Julius S. Morris; architects, Halberton & Rose; contractor, John Sanders & Jas. Button; signed, Jan. 9; filed, Jan. 10; cost $2200.

Sixth near Brannan. Two-story frame; owners, Scott & McCord; contractor, W. P. Smith; cost $2000.

Sacramento near Geary. Additions and alterations; owner, Estate of Wm. Shiels; architect, A. J Barnett; contractor, C. W. Little; cost $3500.

Treat Ave. near 22d. One-story frame; owner, R. D. Cowan; architect, H. D. Mitchell; contractor, A. Lund; signed, Dec. 19; filed, Dec. 19; cost $1860.

Twenty-second and Hampshire. One-story frame; owners, Pat. & Nora Hegarity; architects, Townsend & Wynekin; contractor, Jno. Quinn; signed, Jan. 10; filed, Jan. 11; cost $1040.

Valencia near 16th. Two-story frame; owners, E. Schuntenhaus and John Packwitz; architects, Salfield & Kohlberg; contractor, L. B. Schmid; signed, Dec. 30; filed, Jan. 2; cost $7418. Plumbing and gas-fitting, contractor, H. Hufschmidt; cost $1079. Painting and graining, contractor, J. Quadt; cost $985.

Valencia near 19th. Two-story frame; owner and builder, P. Crichton; architect, Clinton Day; days work; cost $16,000.

Valencia and 16th. Alterations; owner, W. Ede; cost $1500.

Van Ness Ave. Washington. Two-story frame; owner, O. H. Greenwald; architect, A. Page Brown; Supt. Mahoney Bros.; days work; cost $30,000.

Van Ness Ave. near Clay. Plumbing; owner, O. H. Greenwald; architect, A. Page Brown; contractor, R. Rice; signed, Dec. 3; filed, Jan. 2; cost $2885.

Webster near Broadway. Two-story attic, and basement brick and stone residence; owner, Wm. B. Brown; architect, Polk & Polk; contractor, Wm. Bell; signed, Jan. 2; filed, Jan. 14; cost $16,950.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

IF our Supervisors do not change their minds there is danger of another of our City Buildings being botched for lack of foresight. With the present buildings left standing on the site the Criminal Building on Portsmouth Plaza can never be a convenient, symetrical or complete building. It's like "making a purse out of a pig's ear" and an opportunity for the erection of an appropriate Municipal Building will be lost. Those opportunities do not come too often and when they do come those that happen to be in office at the time don't seen able to grasp the situation.

INCE there has been architecture there have been competitions for architectural work—and notwithstanding all their evils they are still with us. Palliatives of those evils we have some—but these are ineffectual without Legislation and that again must be in accordance with the will of the people or it will be ineffective. Witness the present laws on the subject on our Statute Book which are practically dead letters.

In looking up what is the best *modus operandi* for a competition for public architectural work we have a mass of opinions and literature on the subject. In conning over all this we find the following principles unanimously agreed to as the conditions of a professional competition:

FIRST—Professional advice in preparing scheme of competition so that it may include all necessary and no unnecessary requirements.

2d.—Explicit instructions as to the number and character of the drawings; which should be in the nature of preliminary sketches only.

3d.—That an expert jury should be appointed to assist the Board in the judgment of the relative merits of the designs submitted and as to their compliance with the conditions.

4th.—Successful architects to have the work at five per cent commission—and premiums distributed to the other competitors in order of merit to the amount of at least one per cent of total architect's commission.

5th.—In large work there ought to be a preliminary and

final competition—the competitors in the last to be paid.

6th—Sufficient time allowed for the proper study and preparation of the plans.

The reasons of calling for these conditions and other remarks elucidating cannot be better given than in the words of some of the correspondents mentioned in our last number.

1st.—In regard to the first and as hints to a professional advisor Messrs. Van Brunt & Howe say:

"Many schemes are made needlessly difficult either by the imposition of requirements which are incongruous, arbitrary or embarrasing, or by the failure properly to define requirements which are essential. An expert advisor would understand how to discriminate between conditions of necessity and conditions of mere expediency or prejudice, so that the latter might not stand in the way of the former. He should so frame these requirements as to give the largest scope to the artistic capacity of the competitors within clearly understood limits and to eliminate all question of doubt as to the conditions. He should cause to be prepared a careful topographical survey of the ground with contours plainly defined, with the character of the natural features, including tree growth, etc., plainly set forth and with photos of existing buildings and surrounding scenery.

"Amounts to be ultimately expended should be considered so that the competitors should be warned against injudicious economy on one hand and injudicious extravagance on the other.

"Style of the architecture should be left to the competitors subject to general specifications as to the character of building materials available, and the character of existing buildings."

One of the correspondents remarks "with State work, politics often enter and some architect with a *pull* gets some work for the "institution" and recommends therefore that the stipulations be made severe enough, so that even this sort of man, may not ruin the general effect.

In regard to the second item they remark:

"The scheme should plainly define the character and number of drawings required, and at least in the preliminary competition, the scale of these drawings should not be so large as to invite the competitors to unnecessary elaboration of detail and should, in number, be only sufficient to define the leading points of design."

In regard to the expert jury mentioned in item three, Carrere & Hastings says:

"The judgment of the drawings submitted should be a matter of considerable consequence and should be entrusted to men in sympathy with and capable of fully appreciating the problem.

"Perhaps the most satisfactory suggestion which occurs to us at present would be for the Board to nominate a certain number of lay judges, and for the architects to nominate an equal number of architects, say three at the most, making six in all—and to let them judge the competition."

In the matter of picking out five or six architects to enter a competition and paying them, recommended by some; such action in private work would do very well, but in public work it would leave the Board open to charges of favoritism which it would be desirable not to engender.

The reasons and advantages of a double competition are very justly stated by the editors of the *American Architect* in the following language:

"In case of preliminary and final competition instructions given should be entirely full and precise in the first competition, but the work required of the competitors should be limited with great exactness to such simple drawings as will be merely sufficient to give to the expert advisor a clear conception of the real form of the competitor's idea.

"The advantage of making the requirements in the first competition simple is as follows:

"It does not impose upon the competitor a really unnecessary amount of work, and it does not bring about that wanton waste of effort, time and money which would be occasioned if a more elaborated treatment were called for.

"In the second place by asking the competitors for a simple treatment, it does not fix in their minds in a rigid and unchangable form the crude conceptions of the possibilities of the subject, so that they are left with a more open mind and free imagination when the time comes to develop their preliminary idea into the final drawing for the second competition."

To sum up: the general conditions as stated here being recognized amongst architects as just and proper, it only remains to reduce them to explicit and legal language, and get them passed into a Law, of which the justice will be recognized by ordinary capacity and thus may it become an honorable custom amongst all public bodies to adhere to the principles outlined above.

WASHINGTON, D. C., Feb. 4.—In response to a resolution introduced by Representative Loud and adopted by the House, the Secretary of the Treasury to-day sent to Congress the following message:

Treasury Department, Office of Secretary.

Sir: In response to a resolution passed by the House of Representatives on the 21st inst., requesting the Secretary of the Treasury to inform the House what progress has been made under the act for the erection of a postoffice building at San Francisco and the reason for delay in the prosecution and completion of said building, I have the honor to state as follows:

Upon the passage of said act of March 3, 1893, fixing the limit of cost for the new postoffice, courthouse, etc., the plans and estimates for said work were taken under consideration by the supervising architect. On June 12, 1893, however, the department received a communication from the chairman of Committee on Public Buildings and Grounds of the House of Representatives requesting that no action be taken in regard to the erection of said building on the site which had been selected until the House of Representatives should have an opportunity to enter an investigation in regard to the matter.

In deference to said request, the department on June 23d directed that action relative to the preparation of plans and estimates for the building be suspended until further orders. No further steps were taken until October 5, 1893, when in response to a resolution, the Secretary of the Treasury transmitted to the House of Representatives all the papers relating to the selection and purchase of the site. These papers were retained by the House of Representatives until June 9, 1894, when they were returning to the department.

Early in the Spring of 1894 work on the plans for said building was renewed, sketch plans and estimations were made and approved by the Secretary of the Treasury, Secretary of the Interior and Postmaster-General and the preparation of working drawings entered on, which drawings were sufficiently under way to admit of the invitation for proposals for the work of excavating for foundations when Congress, by the act approved March 2, 1895, directed "that before any work is done upon the building or contract let therefor, the Secretary of the Treasury shall cause to be carefully examined the nature of subsoil and bed of foundation of the site purchased for such building and whether character of the same is proper for building, and what will be the cost of making a foundation and whether the construction of the building shall be proceeded with on said site; and the Secretary of War, upon request to the Secretary of the Treasury, shall detail two or more engineer officers of the army to make such examination," said officers submitted a report on the examination made by them, setting forth the result of borings, etc., furnishing drawings to show the location, etc., of said test pits, and concluding with an opinion that the foundations should be of concrete, and that the proposed building can be safely constructed on the site selected; and further, that no reason is apparent, from an engineering point of view, why erection of building should not be proceeded with.

The officers named estimated the total cost of such foundation as they recommended to be $30,540. The prosecution of this work thus interfered with its regular course has proceeded as rapidly as the pressure of current matters would allow. The work on preparation of drawings has been resumed and they will be completed and contracts made as soon as possible. Respectfully yours,

J. G. Carlisle, Secretary.

To the Speaker of the House of Representatives.

It will be remembered that in response to a letter from Judge McKenna an inquiry was made of the supervising architect concerning the plans of the new building. This letter was taken to supervising architect Aiken by Senators White and Perkins and left with that official. After a long talk regarding the proposed building Aiken promised to reply, but after a lapse of a time long enough to have completed the plans of Judge McKenna's courtroom it was thought the supervising architect had forgotten his promise.

So Senator Perkins wrote to him again, recalling the visit and the letter and stating that it having been understood from him that money was necessary to complete plans he would be pleased to be informed of the amount needed to supply the extra help to perfect the plans. Still no answer came. A messenger was sent to Aiken to get from him verbally the figures needed to insert in the bill which Senator Perkins had prepared, designed to supply funds which would enable the Postoffice plans to be complete and work on the new building to be commenced. Aiken promised to reply by letter, but never did so. Other efforts were made to secure data necessary to enable Congress to take action, but Aiken did not reply.

On January 30th, another letter was written by Senator Perkins, in which he called attention to his former communication and to a promise that a reply would be given to the inquiries of Judge McKenna's letter, that an answer might be made to the Judge. It was assumed that Aiken would not be so discourteous as to refuse to reply to the many inquiries made and that the letter had gone astray. This brought forth a reply, but not such as was expected. It was in the form of a letter from Secretary Carlisle, per Aiken, in answer to Senator Perkins' communication, in which he said: "I have to advise you that the department considers it impracticable to give the information desired. If, however, the committee, either in the Senate or House, should ask for information as to what steps the department would advise to be taken to facilitate and hasten the construction of public buildings such request would be complied with."

Here, at least, was something definite. Aiken, through Secretary Carlisle, refused to give the amount which Aiken (as architect) said was necessary to complete the postoffice plans so work might be commenced. But still there was no reply from the recalcitrant architect.

At last it was determined to take another course of action, and a messenger was sent to the architect's office to recover the letter of Judge McKenna, which had been ignored as completely as had the personal requests and communications of the California Senators. He was instructed to remain in the architect's office until the letter of the Judge was delivered to him. He waited, but did not get the letter.

Aiken finally wrote Judge McKenna to-day, submitting three alternative plans for the arrangement of courtrooms, and this matter will be intrusted to John P. Irish to deliver. Irish leaves to-night.

The above is taken from the *Call* and comment seems superfluous. The obstructions placed in the way of San Francisco's much-need and long-promised new Post Office, seems to be intentional on the part either of the Supervising Architect or the Secretary of the Treasury; probably of the latter, as the position of Supervising Architect is a comparatively subordinate one and the boorishness of the incumbent is undoubtedly inspired by his superior officer.

From the official report it is seen that early in the spring of 1894 the plans were begun, and that it took the Supervising Architect's office a full year to get as far as to be able to advertise for bids on the excavating; now another year has passed away, and the office is not even prepared to invite bids on the excavating.

Would any architect in private practice dare to present such excuses, or rather lack of excuses, as justification for delay.

PAPER READ BY JOHN COTTER PELTON BEFORE THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

CONTINUED FROM JANUARY NUMBER.

Time is usually of sufficient importance to be considered in any business undertaking; In a building enterprise, the first question of importance after that of cost, is the time which must be given the work of construction, and many plans and methods are taken advantage of to facilitate progress, and hasten the occupation of the building and the opening of the rent roll.

The loss from the area of land in space occupied by the walls I do not believe is always appreciated. I am quite sure it would startle the owners of some buildings, even of recent date. The Mill Building, in this City, loses in its walls twelve per cent of the lot area; the Crocker Building loses eighteen per cent, and the Chronicle loses twenty-one per cent. This seems to me to represent a loss in income,

and any saving in such loss seems to me just so much increase in the income.

The first building to which I applied a marble facing, was built on California strreet, near Devisadero street, in this City, for Mr. John I. Sabin, some four years ago. This was a wooden building, and was faced to a height of about ten feet, this height representing about the extent of my confidence in the safety of two inch marble. I could figure to do better, but did not feel quite prepared to undertake a greater height.

The next occasion presented itself in the Telephone Building at Los Angeles. The character of the design called for uniformity of material, the height was about thirty feet, and with the limit in mind, of my first experience, (ten feet) was developed the idea of dividing this height of thirty feet into three sections, and supporting the weight of each section independently, *i. e.* transmitting it to the wall. This may be called the first step in this method of ashlar construction, *i. e.* the interruption of the accumulation of the weight. The walls of this building were built, the carriers sat, and the setting of the marble had progressed to the height of the first interruption or carrier, when it was discovered that the variation of these carriers from the proper measurements was so great, and the alignment so irregular as almost to cause an abandonment of the proposed facade, and this was with difficulty overcome. Here came in the attachment of a second and separable bracket or shelf, with means of adjustment to this irregularity of setting and alignment.

The construction of the marble Library Building at Stockton, California, was then undertaken, with a frontage of 210 feet, and carried to a successful issue.

I trust I am not over-confident in saying that this piece of work has demonstrated the feasibility of the constructional principles, and that an examination of its details will substantiate the claims which I have made for the released system of ashlar construction.

Let us now look for objections; if this is *not* a proper form of construction, there must be clear and tenable reasons, readily stated.

From an artistic or æsthetic standpoint, let us first look for these objections. *I have looked* earnestly, and am unable to find an æsthetic law of thickness. I find nothing to justify the term veneering.

I have never heard an artistic comment upon the thickness or the amount of paint upon an artist's canvass. It is the expression, the character or the sentiment which appeals to us. In fact I cannot find, in the world of art, or in the æsthetic history of architecture, anything about measurements or thickness—to be more practical, I have never heard, except by the ignorant, the term veneering applied, to the architectural facing of four inches of pressed brick in the usual form.

Now, from a constructional standpoint, I am unable to figure out a practical defect, which cannot be provided for. I will state two which have been called to my attention, and which have been certainly worthy of the most careful study and investigation, and to which I am prepared to make answer, but upon these points, I feel that much more can be said, and I trust that if this subject seems to you to be of interest, or that the perfection of such a system of construction may be of value, that some discussion may ensue upon these questions.

The questions are; the possibility of leakage through the joints, and the grinding tendency caused by vibration in a tall structure.

The question of leakage, I think may be answered by proper attention to the workmanship. I have not heard this question raised against the use of a facing of pressed brick, having a multiplicity of joints; why should it be raised against a construction by which this very possibility is reduced five-fold; still, should there be such danger through accident or careless workmanship, it has been suggested by Mr. G. W. Percy, in his report to the Harbor Commission, that means may be provided in the space behind the facing, to care for such seepage.

In the consideration of the question of the tendency of grinding, it must be a very tall structure in which this question would be taken up, but I am prepared to allow to it all the importance which the most careful and technical practitioner may think necessary—feeling that the result will again be found satisfactory. In fact, does not the consideration of this very question revert in favor of the interruption of the facing frequently in the height of such a building and mean another finding in favor of the method? As to the thickness of the facing and the frequency of the interruption, I may say that one balances the other, as the facing increases in thickness, the interruptions should be made at most frequent intervals.

As to the forms of the carriers or anchors, this of course depends upon their position, or upon the duty which they must perform, and varies, of course, constantly according to the architectural character of the facade, etc.

Something might be said of the adaptability to various designs of this method of construction, but still it does not seem necessary; for although familiarity with this form of construction might lead to more simple and readily applied design or style, still it is but a matter of more or less study to make its application satisfactory in any example.

I may state that in the construction of the Stockton Library Building where the Grecian Ionic style was used, no detail was sacrificed in the application of the construction. The style was fully carried out in all its parts and in every detail.

The respective projections are provided for simply by greater strength in the parts.

In the treatment of exposed corners, reference may be again made to the Library Building and to the Telephone Company's Building, in no part of which structures is the thickness of the material evident, and how much more readily this may be effected in the freer Romanesque or Renaissance details, need only be suggested.

In the application of this form of construction to a modern building with steel framing, I feel that there is possible a most perfect achievement, attaining a degree of perfection beyond any form now in use, *i. e.* the strength of the structure being secured in the steel frame—a minimum of material being used for the protection of this frame from fire, and a minimum of material being required for the facing.

ELEMENTARY ELECTRIC DATA.

THE PRACTICAL APPLICATION OF DYNAMO ELECTRIC MACHINERY BY MAC FADDEN AND RAY.

"WHAT is electricity? A question often asked and probably never as yet clearly answered.

Those interested in the practical field, find it almost impossible to keep up to the times, in regard to the laws that govern its generation and control. We know that by means of certain combinations of coils of wire and magnets or by means of chemical action, we can produce, we may say, electricity.

We must be content if we master a few leading laws governing the generation and application of the Electric current. Let the Scientists and Philosophers discuss the question as to what electricity is. In dealing with the simple electric current that is generated by dynamos, batteries, etc., we will find that there are several broad and easily understood laws that govern its practical applications. These laws hold good in all cases and under all conditions, and should be thoroughly understood by anyone desiring to learn even the first and most simple effects of a flow of electric current.

Probably the easiest way to understand this law will be to take a simple case of a pump connected to a loop of water pipe. The pipe is filled with water and it is evident that if the pump is started there will be a circulation of water from the pump through the pipe and back into the pump again. The pump furnishes the power to move the water in the pipe—and it is evident that the water moves through the pipe owing to the pressure exerted by the pump on the water. In (figure 1) an open tank, (d) is shown into which

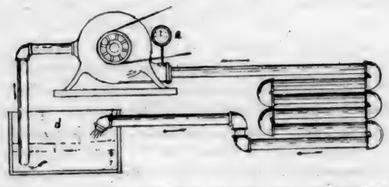

FIGURE 1.—PUMP FORCING WATER THROUGH PIPES.

the water flows from the pipe. The pump takes the water from the tank to keep the pipe filled, and the speed of the water through the pipe and therefore the quantity of water passing through the pump and pipe in a minute of time, will depend on the pressure given the water by the pump.

If we double the pressure of the water and the friction or resistance to the flow of water in the pipe remains constant, the quantity of water handled by the pump will be doubled. In other words by increasing the pressure, we increase the quantity of water passing through the pipe at exactly the same ratio. Now if we found that a guage placed at (a) would have to register 50 lbs. pressure to make 100 gallons of water pass through the pipe in a minute, it is evident that if the friction in the pipe remained the same, that 100 lbs. pressure ought to put 200 gallons through the pipe. It is also evident that if 100 feet of pipe a certain size offers a definite amount of friction, that twice the length of pipe would have two times the friction or resistance to the flow of water that the 100 feet has. Thus to put 100 gallons of water a minute through a pipe will take ½ the pressure required to force 200 gallons through the pipe. This example may serve the purpose of illustrating the principle of the flow of current from a source of electricity. We will let the dynamo take the place of the pump, which will generate the pressure to send the electricity through the circuit which may consist of lamps, etc., connected by means of conducting wires. The friction in the pipe is represented by the "resistance" of the wire and circuit, and the amount of water used, represent the quantity of the current of electricity.

Instead of using the pound as the unit of water pressure we will use the term "volt" which is the unit of electrical pressure. We also have a term which denotes the unite of "resistance," which is the equivalent of "friction" used in the illustration of the pump and pipe. The unit of resistance is called the "ohm."

Then lastly the *quantity* of current in electricity is measured by the unit of current quantity, the "ampere." This is the quantity of current that a pressure of one volt will force through a resistance of one ohm.

The resistance of a conductor of electricity varies not only with its size or cross section but also with the material of which it is made. Silver, when pure, is the best conductor of electricity known, but copper, when pure, nearly approaches silver and is so much cheaper that it is used in nearly all cases to distribute current for practical purposes.

The metals in their order for conductivity are as follows: Silver, Copper, Gold, Aluminum, Zinc, Platinum, Iron, Lead, German Silver, Platinum Silver alloy and Mercury.

In practice the wires or conductors to carry current are either designated in size by their diameter in thousandths of an inch (or mils) or by the sectional area or cross section of the wire expressed in circular mils or by the size in number, as measured by the Standard American or Brown & Sharp Wire Guage.

A circular mil is a circle 1-1000 inch in diameter.

As in the case of pump, the higher the pressure in volts at the dynamo, the larger quantity of electricity (expressed in amperes) will be put through a circuit which has a resistance (expressed in ohms) to the flow of current.

Thus if 1 volt pressure will force one ampere of current through a circuit having 1 ohm of resistance, it will take 5 volts to force 5 emperes through this same 1 ohm of resistance, it will take 5 volts to force 5 amperes through this same 1 ohm of resistance and if this resistance is increased to 2 ohms, the pressure would have to be 10 volts to force 5 amperes of current through it.

It will be seen that these terms are dependent on each other and their relation to each other is expressed by what is known as Ohms Law which is expressed:

$$\text{Current in Amperes} = \frac{\text{Pressure in Volts}}{\text{Resistance in Ohms}} \quad \text{or} \quad C = \frac{E}{R}$$

"C" standing for current, "E" for electro-motive force or volts, and "R" for resistance expressed in "Ohms." This relation C=E | R must be remembered for it is the fundamental law of the governing of electric currents, and is used as a foundation to obtain all of the more complex formulas known to the Electrical Engineers.

Take the simple case of a certain make of incandescent lamp, the resistance of the lamp in question is found to be 200 ohms. The pressure of the circuit on which this lamp is designed to run is 100 volts, and according to Ohms law the current in amperes which 100 volts pressure will force through 200 ohms of resistance is 100-200 or ½ which is the number of amperes such a lamp would allow to pass through it if current at 100 volts pressure was applied.

It will thus be seen that it is a very easy matter to obtain any one of these quantities, provided we have the other two given, by a simple multiplying or dividing of the two known quantities. The relations to each other are expressed

$$C=\frac{E}{R}, \quad E=R \times C, \quad \text{and} \quad R=\frac{E}{C}.$$

There is still another term with which the practical man is brought in contact and that is the unit of power, the "watt." This watt is the *power* represented by the passing

of 1 ampere of current through 1 ohm of resistance and can always be obtained of any current by multiplying the number of volts by the number of amperes.

Thus in the incandescent lamp before spoken of, the watts used by the lamp would be 100 (volts)x½ (amp)=50 (the number of watts), this being the amount of electrical energy necessary to be applied continually to keep the lamp burning. Such an incandescent lamp would be termed "a 50 watt incandescent lamp." An arc lamp which needed a current of 10 amperes at a pressure of 50 volts to keep it in operation would be termed a "500 watt arc lamp." * *

THE OLD CITY HALL OF SAN FRANCISCO.

THIS old landmark is now razed off the face of the earth and plans are already in for a building to take its place. As a tributeto the Archæology of California we are enabled by the courtesy of the Hinton Printing Company to publish two views of the building at different stages of its career, and take the following interesting account of its history from the pages of the Municipal Report of San Francisco for 1894-95:

The Board of Supervisors, on January 4, 1895, instructed His Honor the Mayor to sell all the improvements on the City Hall lot on Kearny street, between Merchant and Washington streets.

The buildings had been vacated and accommodation provided for the different offices and departments in the New City Hall, and while some temporary use was made of different portions, the buildings were held to be unsafe for further use.

The purchase by the city and county at different times of the lots and improvements, and the alterations made to adapt the buildings for municipal uses, as well as the repairs and alterations required to be made in consequence of the damage done by the earthquake on October 21, 1868, cost the municipality over one million dollars.

In June, 1852, the Jenny Lind Theater—the central lot and building between the Union Hotel and the El Dorado buildings—was purchased for a City Hall at a cost of $200,000. In March, 1864, the Union Hotel lot and building, on the corner of Kearny and Merchant streets, was purchased for $65,000, and the El Dorado lot and building, on the corner of Kearny and Washington streets, for the sum of $45,000. In March, 1866, a lot and building in rear of the Old City Hall, now occupied by the Morgue, was purchased for the sum of $15,000.

The site of the Old City Hall is a memorable one, being the central point where the various phases of early California life had full swing, with all the license and abandon that characterized the gambling mania. The following are extracts from the "Annals of San Francisco" and the daily newspapers, in respect to matters appertaining to the site and its use, from time to time, in spite of the destruction visited upon its so-called improvements by conflagrations, to wit:

From the "Annals of San Francisco":

December 26, 1849.—This morning about six o'clock, the awful cry of fire was raised in the city, and in a few hours property valued at more than a million of dollars was totally destroyed. The fire began in Dennison's Exchange, about the middle of the eastern side of the Plaza, and spreading both ways, consumed nearly all that side of the Square, and the whole line of buildings on the south side of Washington street, between Montgomery and Kearny streets.

A certain two-story frame building, known as the "Parker House," and situated on Kearny street facing the Plaza, paid its owners one hundred and twenty thousand a year in rents. Of this sum, somewhere about sixty thousand dollars was paid by gamblers, who occupied nearly the whole of the second floor. The "El Dorado," a gambling saloon which adjoined the "Parker House" on the right, at the corner of Washington street, and which was only a canvas tent of moderate size, brought at the rate of forty thousand dollars per annum.

May 4, 1850.—The second great fire in San Francisco, when property to the value of nearly four millions of dollars was supposed to be destroyed. It began about four o'clock in the morning, in the building on the east side of the place called the United States Exchange and before eleven of the forenoon three immense blocks of buildings, with a few trifling exceptions, were totally destroyed. These were the blocks lying between Kearny, Clay, Montgomery and Washington streets, and the two blocks between Dupont, Montgomery, Washington and Jackson streets.

June 22, 1851.—The City Hall, located at the corner of Kearny and Pacific streets, which had been originally erected at an immense expense as a hotel and was purchased more than a year before by the corporation for one hundred and fifty thousand dollars and improved at a heavy cost, was totally consumed, although the principal office records were saved. Mr. Thomas Maguire, the proprietor of the "Jenny Lind Theater" (which was opened in September, 1850), on the Plaza, which was a most valuable building, now lost all again—a sixth time by fire.

October 4, 1851.—Opening of the new Jenny Lind Theater, on the Plaza. This was a large and handsome house. The interior was fitted up with exquisite taste; and altogether, in size, beauty and comfort, it rivaled the most noted theaters in the Atlantic States. It could seat comfortably upwards of two thousand persons. The opening night presented a brilliant display of beauty and fashion, and every part of the immense building was crowded to excess. A poetical address was delivered on the occasion by Mrs. E. Woodward. A new era in theatricals was now begun in San Francisco; and since that period the city has never wanted one or two first-class theaters and excellent stock companies, among which "stars" of the first magnitude annually made their appearance. Before this date there had been various dramatic companies in San Francisco, but not before had there been so magnificent a stage for their performance. The "Jenny Lind" did not long remain a theater. The following year it was purchased by the town for a City Hall, for the enormous sum of two hundred thousand dollars. The external stone walls were allowed to stand, but the whole interior was removed and fitted up anew for the special purposes to which it was meant to be applied.

Under the caption of "Hotels, Restaurants and Boarding-houses": The first really substantial and elegant hotel of the city was the "Union." This was a four-story brick building, with a front of twenty-nine feet, on the east side of Kearny street, between Clay and Washington streets, and a depth of one hundred and sixty feet. It was constructed, arranged, finished and conducted as well as any similar establishment at that time in the United States. The cost of

the building and furniture was $250,000. Messrs. John Middleton, A. A. Selover and E. V. Joice were the enterprising projectors, builders and owners of this superb concern. The tables were supplied with every imaginable luxury, and the boarders were of the wealthiest and most respected inhabitants and visitors of the city. This house, with its contents, was destroyed in the fire of May 3, 1851, and although it has been rebuilt several times, after repeated conflagrations, it never resumed its original character. It is now (1854) occupied below as an extensive billiard-room and drinking-saloon, while the upper stories are divided into comfortable lodging apartments. It is a celebrated resort for all classes of politicians, and most of the schemes affecting the interests of the State and city are here concocted.

JUNE 4, 1852.—The purchase of the new Jenny Lind Theater and Parker House for the purposes of a City Hall was another of the Common Council jobs which excited very much angry discussion at the time, and which afforded interesting and amusing matter for the newspapers the "Jenny Lind Swindle," or sometimes "Juggle," they facetiously called it, during half a year. The old City Hall having been destroyed in the fire of June 22, 1851, the various municipal officials were compelled to get business chambers where they could, for which very high rents had to be paid. As the different public officers were now located in separate parts of the town, much inconvenience was experienced. The arrangement could only be temporary. The rents, which were somewhere about forty thousand dollars per annum, formed a heavy tax upon the public; while ground could be bought and a proper building erected by the city itself for about four or five times that amount. Several desirable sites could be had in the town on moderate terms, and responsible contractors were ready to undertake the construction of the proposed building at fixed rates, which would certainly have reduced the total cost below two hundred thousand dollars.

In these circumstances, the Common Council, for reasons, as the saying is, best known to themselves, and in spite of the indignant cries of the citizens and the general remonstrances of the press, determined—in conjunction with the Board of Supervisors of the County, who were to pay half the costs—to purchase the Jenny Lind Theater, and convert it into the proposed City Hall.

The purchase money of the building as it stood was to be $200,000; while to remove all the inside walls, leaving only the outer ones standing, and to build up the interior anew properly fitted up for municipal purposes, was believed to involve the expenditure of nearly-half as much more. At the same time, it was supposed that the building when so altered would be only a miserable structure at the best. An audience authorizing the purchase was passed by large majorities in both Council Boards, and sent to the Mayor for approval, which was refused. Notwithstanding, the Common Council, on the fourth of June, re-adopted the obnoxious ordinance, and passed it by a constitutional and almost unanimous vote.

Meanwhile the public wrath was growing very clamorous, the more so perhaps that it was impotent. On the evening of the first of June, one of the usual mass and indignation meetings was held on the Plaza, where the proposed purchase was passionately denounced. Mr. William A. Dana presided on the occasion. This was one of the most stormy meetings that had ever been held in the city. Hon. David C. Broderick, who was in favor of the proposed purchase, attempted to make a speech for his cause, but the noise and reproaches of the meeting effectually put him down. Sundry squabbling and wordy sparring took place between Mr. Broderick and Dr. J. H. Gihon, who was on the occasion the people's orator; and the meeting ended in hubbub, riot and confusion. Little cared the Common Council for such proceedings—the general ire—the Mayor's veto—the denunciations and the ridicule of the press. The matter was carried finally into the Supreme Court, at the instance of some public spirited citizens, and shortly afterwards a judgment was obtained recognizing the right of the city and the Board of Supervisors to make the purchase. This was forthwith done; and the contemplated alterations were speedily made on the building, although at a great expense. The whole affair was long a prolific subject for conversation and discussion, for ridicule and the imputation of corrupt motives. It served to glorify the Council of the year as the notorious Aldermen's salaries and medal pieces of business had immortalized a previous party of "City Step-fathers."

After the purchase was made and the alterations completed, it was found that the new structure answered the purpose intended better than was at first anticipated. The situation is excellent. At the present time, however (1854), it is beginning to be discoverrd that the building is too small for the increased business of the city. Movements are now making to purchase additional business chambers elsewhere, or to include a portion of the adjoining Union Hotel into the municipal establishment. Doubtless, before many years pass, the whole of either that building or of the El Dorado gambling-saloon on the other side, if not both, will be required for the necessary extension of the City Hall, unless indeed it be located in some altogether different quarter and built anew.

APRIL, 1854.—The large public saloons, so numerous in 1849 and immediately succeeding years, have become few in number. * * * The chief of them are the "El Dorado," on the Plaza. * * * These places still exhibit the old lascivious pictures on the walls, while orchestral music, excellently performed, continues to allure the idle, the homeless and family-less as to a place of enjoyment, where their earnings are foolishly spent. The cards are often still dealt out and the wheels turned, or dice thrown, by beautiful women, well skilled in the arts calculated to allure, betray and ruin the unfortunate men who become their two willing victims.

From the *Evening Bulletin* of October 21, 1868: EARTHQUAKE—The City Hall is in a bad condition, and the only people inhabiting it at present are the officers of the Fire Department. The Courts are all adjourned and the prisoners were taken from the Station House to the County Jail. A line has been stretched across the front to keep people away. Several large stones in the front wall fell out, and the entire structure may be considered a wreck.

From *Examiner* of October 21, 1868: THE CITY HALL—The Hall is badly damaged. The front looks greatly dilapidated. The inner walls are cracked and opened in many places. The Probate Court room and the Twelfth District Court room are badly torn up, while the upper story is almost beyond repair.

From the *Daily Alta California* of October 22, 1868: THE RESULTS AND LESSONS OF THE EARTHQUAKE.—The State was visited yesterday by an earthquake, and the shock in San Francisco was the most severe felt here since the foundation of the Mission, ninety-two years ago, with perhaps one exception, in 1808, when several adobe walls were thrown

down, but of that shock we know so little that it is impossible to make any satisfactory comparison with it.

Amidst the multitude of slight movements of the earth's surface observed here since 1848, the only one which did any damage before that of yesterday occurred on the eight of October, 1865, when several cornices and parts of green brick walls were thrown down. In that shock the motion was mainly perpendicular, and perhaps it was for that reason that the amount of glass broken was far greater in 1865 than in the horizontal movement of 1868. On the other hand, more cornices were thrown down yesterday.

The main facts of the earthquake as felt in this city, are that four persons were killed by the falling of cornices and chimneys, that a dozen brick buildings on made ground are shattered so that they are untenantable; that the cornices of two dozen buildings have been thrown down, and many walls were cracked, much plastering loosened and many window panes broken.

On the other hand, no person was seriously injured in a house, and the great majority of the buildings on the natural upland show no signs of having been damaged in the least.

The spires of the churches, towers of the Masonic Temple, Merchants' Exchange and Synagogue Emmanuel, the four and five story buildings on Montgomery and Kearny streets are uninjured.

The foundations of buildings should, on the made ground, be as solid as possible; and high chimneys should be secured by iron bars, fastened on with bands and running down below to top of wall. Brick buildings should be tied together by strong iron rods, their walls should be thick, the best mortar should be used and the height should not exceed three stories.

Action of the Chamber of Commerce.—The Chamber of Commerce held a session in their chamber in the Merchants' Exchange. Several members spoke of the importance of transmitting correct intelligence to the East and to London.

A committee of four were appointed to collect information and make an estimate of the probable loss.

Messrs. Otis, Friedlander, Ralston and Gordon form the committee.

These gentlemen met at one o'clock in the parlor of the Bank of California and prepared the following dispatch:

"A severe shock of earthquake experienced here at 7:50 A.M. Considerable alarm felt at time of occurrence. A good many buildings on made ground injured.

"Custom house and City Hall, both poorly constructed, badly injured, and some buildings in process of erection have fallen in. Some parapet walls falling have caused the loss of four lives. No damage to well-constructed buildings.

"Total loss on property will not exceed $300,000.

The President of the Chamber of Commerce, with the approval of the above committee, forwarded the above despatch immediately to the Chambers of Commerce in all the Atlantic, Western and European cities.

From John S. Hittell's History of San Francisco: Gambling was a prominent feature of San Francisco life before 1855. Among the notable gambling houses were the El Dorado, on the southeast corner of Kearny and Washington streets; the Verandah, on the opposite side of Washington; the Bella Union, on the other corner; the California Exchange, on the northeast corner of Clay and Kearny; the Arcade, the Casino and tne Tolka, on Clay and Commercial streets.

Among the notable buildings were the Custom House (an adobe building of one story on the southwestern corner of Brenham place and Washington street), the City Hotel (an adobe of one story and a half on the southwestern corner of Clay and Kearny), Mr. Mowry's dwelling (one-story adobe on the northeastern corner of Broadway and Powell) the adobe residence of Senora Briones (on the northeastern corner of Powell and Filbert) a brick dwelling on the northwestern corner of Washington and Powell (originally of two stories, but now of four, two others having been added beneath because the streets in front of it have been cut down about sixteen feet), and the Parker House (which was built at a cost of thirty thousand dollars and rented at fifteen thousand dollars per month as a gambling house), a two-story frame building on the site of the Old City Hall, fronting on Portsmouth square. The southeastern corner of Kearny and Washington streets was occupied by a large tent, called the El Dorado, and that, too, was used for gambling. The Parker House was burned in December, 1849, and having been rebuilt, was converted into the Jenny Lind Theator, Thomas Maguire being the manager. It was burned again in May, 1850, and in June 1851, and after the last firr the theater was rebuilt of brick, with a stone front, which still stands as a part of the Old City Hall.

* * * * * *

These people did not serve Broderick for nothing, many of them received high pay, usually out of the public treasury. It was not his policy to let those who had been his friends go without reward, some with office, some otherwise, When the County Supervisors and City Council, in 1852 (the city had then one government and the county another) united to buy the Jenny Lind Theater from his friend, Thomas Maguire, for twice as much as the property was worth, he favored the transaction. It was consummated in defiance of a strong outbrst of popular indignation, but not long afterward the value of land advanced so much that the property was worth more than had been paid for it.

When Broderick sought to secure the Senatorship in 1854, he felt the want of support of some respectable newspaper in San Francisco, and he secured that of the *Alta California*, which had previously been his enemy. As it depended for its support mainly on the merchant, with whom, as a class, he was very unpopular, the paper incurred serious risks by advocating his cause, but a cash consideration was paid, and consequently the County Supervisors purchased the Alta Building on the southwest corner of Washington street and Brenham place for a Hall of Records, paying about fifty thousand dollars in warrants, or the equivalent of forty thousand dollars in gold, for it—considerably more than it was worth.

From Colville's Directory, 1857: The fire-proof brick office of the *Alta California* newspaper (Washington street and Brenham place) having been purchased for the round sum of nearly $50,000 in scrip for a Hall of Records, was opened for that purpose on the nineteenth of July. This is one of the very few evidences of any value received by the city for all of its vast expenditures.

BOOKS AND PERIODICALS.

LIPPINCOTT'S for February contains the complete novel "Ground Swells" and in the article on "Paralysers of Style" gives some much needed strictures on the slovenly way of writing of the present age; want of grammar, bad punctuation and such like lapses. The cry is quantity now a days not quality and the high pressure speed at which masses of literature must be turned out causes this want of propriety. We are afraid, however, that while the present fabric of society exists no return can be had to the grand old style of the Elizabethan Age in Literature; no more than to the restful style of the Greeks or the free style of the Middle Ages in Architecture.

PRACTICAL STAIR BUILDING AND HANDRAILINGS by the Square Section and Falling Line System by W. H. Wood. London, E. & F. N. Spon—New York, Spon & Chamberlain, 12 Cortlandt street.

In this work is presented a very full and explicit treatise on stair building—full of practicality and illustrated with quite a number of geometrical diagrams elucidating all the problems that arise in the course of a stair builder's profession treated in a different manner than heretofore. Being both elementary and advanced it will be found a useful hand book on the subject. The price of the book is $4.25 and can be had from G. W. Alexander, 401 Market street, San Francisco.

MUNICIPAL REPORTS, San Francisco, 1894-95.—Published by order of the Board of Supervisors. From Mr. Jno. A. Russell clerk of the Board of Supervisors of San Francisco, we have received the usual yearly reports of the several offices constituting the Municipal Government in a volumn of about 1500 pages, typography good and arrangement succinct; a reference book of great value for statisticians.

The "Practical Application of DYNAMO ELECTRIC MACHINERY," by McFadden & Ray, price one dollar. A handy little book for all architects to have with them, explaining electrical wiring and machinery in a simple and easily understood manner.

Elsewhere we have made an extract from this book to show its style and its usefulness.

The FORTNIGHTLY for January. In the "Blessedness of Egoism" we are given an account of the philosophy of Maurice Barres and Walter Pater, and the disgust with all modern conventionalities and ideals with which the thinker is sometimes seized, making him long for the solitude of nature away from the busy haunts of men. As one of the author's heros remarks truly "With a little alcohol and rare beef at meals, and with money in one's pocket, one may endure contact with men," inferring that without these to a poetic temperament they and their little money getting carking cares are unendurable.

An interesting account of Emile de Laveleye and his ideas is given in "Socialism at Home and Abroad."

"Laveleye defined luxury as 'all that is at once expensive and superfluous,' and he condemned it, from moral and political grounds, as opposed to the true ends of life. Like a good economist, he also repudiated the usual defence of luxury as being "good for trade," pointing out that national prosperity did not arise from unrestrained consumption and unlimited production, but sprang rather from the accumulation of resources resulting from good economy. Most of all, he opposed the reckless and profuse living of great towns; this he did first on the above-mentioned grounds, but also in the name of right and propriety, which required from the rich a constant discharge of duty towards their numberless disinherited brethren. *The one exception which he made was alike characteristic of himself and of his artistic country; all kinds of sumptuousness appeared to him permissible in public buildings.*"

The sentence in italics ought to be taken to heart by those critics who are constantly desirous of saving a few dollars when a question comes up of the expense of a public building, so much so, that we find the architect of the United States of America cannot employ enough draftsmen to do his work properly because he hasn't the funds to pay them, while a multimillionaire is allowed to spend $7,000,000 on his country residence without a protest—in fact his extravagance is lauded.

FIRST ANNUAL REPORT OF MANUFACTURERS ASSOCIATION OF CALIFORNIA—Represents a record of much work and good done in the way of bringing California made products to the fore. As there is no doubt that California materials equal any in the world when given the same opportunity, we wish the Association still further success this year—more especially in instilling into consumers the dishonorableness of going outside for their goods, if able to pay California prices for home work.

The want of this is illustrated by a case brought to our attention lately—when a person holding a high salaried position under the State sends to Mr. Wanamaker in the East somewhere, to get his clothes made; by which means he gets a trifling reduction in price but leaves his own constituents without the means of living.

FALCONNIERS' BLOWN-GLASS BRICKS.—The illustrated album of Falconniers' patent Blown Glass-Bricks to hand:—The article is made by the Adlerhutten Smelting Works at Penzig, Silesia in different models and colors.

A wall of glass-bricks would apparently present an original appearance; the day-light enters it freely, but it is not transparent. Such bricks would be non-conducting of heat, sound and electricity, and must diffuse the light splendidly. The laying of them is very simple, being accomplished in the same manner as ordinary bricks viz. with mortar or cement. This makes the bricks a very valuable material for building hot-houses, ice-houses, especially for factories. The face of them can be parted in pilasters with walls of glass-bricks between and with some windows for ventilation. We understand these bricks have proved very satisfactory for varandas, winter-gardens, factories and greenhouses and would be useful for lighting premises looking over small courtyards which it is not desirable to see or smell, one would think they would be very useful, and by silvering them on the back they act as mirrows and are therefore of benefit in dimly lighted apartments.

NICKEL STEEL.

IF the truth of the statements of Mr. Robert M. Thompson in regard to a new alloy of fifteen per cent of Nickel with Steel can be verified, architects have at hand a metal that will take the place of steel in all building constructions.

Think of an alloy that will not rust, with a tensile strength of 244,000 pounds, with an elastic limit as high in proportion as that of the lower Nickel Steel.—Ed.

Mr. Robert M. Thompson, President of the Orford Copper Co., of New York, at the meeting of the Iron and Steel Institute, in England, made a very interesting address in reference to the manufacture and use of nickel steel. He said there was no doubt but that the United States Government had taken more interest in the use of nickel steel than any other of the great governments in the world, and in doing so it encouraged the steelmakers to use it not only for governmental, but for private purposes. Reference had been made to the quantity of nickel steel that was being used on this side of the water, and he was very glad to know that it was being made here in quantity. During the three years in which the development work had been going on on the other side, there had been somewhere between 50,000 and 75,000 tons of nickel steel produced in the United States. That carried it absolutely out of the domain of experiment. It was to-day, as far as the quality of steel described in the paper, as much a matter of every-day practice in the production of it as was the production of ordinary steel. But the question of the utility of nickel in connection with steel had not yet been finally closed. There were higher alloys which were being experimented upon which contained even greater properties. An ingenious German chemist had just concluded some experiments, and probably many of them had seen an account of his experiments, carried with all the German thoroughness, through all the various grades of nickel from one per cent up to twenty-five per cent, and with varying degrees of carbon. That chemist had arrived at the fact that at about fifteen per cent of nickel an almost new metal had been discovered, one with a tensile strength was obtained of 244,000 lbs. to the square inch with an elastic limit as high in proportion as that of the lower nickel steel. He had made a rough estimate of what an alloy of this kind could be produced at when used in the construction of all the steel parts of one of the great battleships which the world was building now in every quarter. If used for hull plates and all the various parts where it could be employed, it would not increase the cost of the battleship two per cent; and yet only conceive of the enormous increase in strength and the increase of the value of the ship as a weapon of offence, and the great saving that could be made in the whole weight, thereby allowing that ship to carry more coal, heavier guns and more munitions of war—in other words, at a mere nominal increase of cost the actual value of the weapon would be nearly doubled. In the United States at the present time, nickel steel was being used for armour plates, it was being used for the barrels of small arms, it was being used for large guns, it was used for wire for making torpedo netting, and it was being employed in the construction of vessels. The Steel Board of the Navy Department had recommended that the entire hulls of the new battleships that were building should be constructed of nickel steel. The boilers that were being prepared for the "Chicago," were being made of nickel steel, and the shafts of some of the new vessels—the "Columbia's" shaft, he thought, was an instance—were of the same metal. Some reference was made to the roughness of nickel steel as produced. It was certain, however, that they could also produce nickel steel of the very finest quality. He held in his hand a little purse made from nickel steel; it was an alloy of twenty-five per cent of nickel and steel, and nothing could be finer than the workmanship. It was made by the Ferro-Nickel Society, of France, and they were producing a very wide variety of articles, such as bits for horses and scabbards for army swords; they were also making a coat of mail, or a cloth of mail as they might call it, with minute rings, and in every way they were making most interesting articles from it. Their alloy possessed the property that it did not rust; it had perhaps all the qualities of German silver, with very great strength; it had a tensile strength of over 100,000 lb. to the square inch.—*The World's Progress.*

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.
Seth Babson, Pres. W. P. Moore, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Southern California Chapter American Institute of Architects, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
Octavius Morgan, Pres. A. M. Edelman, Vice-Pres.
Arthur B. Benton, Sec't. August Wackerbarth, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.
C. E. Grunsky, Pres. Geo. W. Dickie, Vice-Pres.
Otto Von Geldern, Sec. W. C. Ralston, Treas.

California Electrical Society, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
Geo. P. Low, Pres. C. O. Poole, Vice-Pres.
Max Caspari, Sec. H. T. Bestor, Treas.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Building Contract—Change of Plan.—Where, in an action to recover damages for prospective profits under a contract for driving piles, which provided that the architect might make deviations from or alterations in the plan of the work, it is shown that, owing to the formation of the ground, the architect determined not to have the piles driven, and there was evidence that, after the contracting company knew of this determination, it received a contract for the work substituted for the piles, it was proper to refuse its request to charge that, under the pleadings, the question of waiver could not be considered. In such a case it was proper to charge that, if the contracting company received from the owner reasonable notice of the change of plan, it could not recover for any piling omitted.
St. Louis Bridge & Iron Co. v. St Louis Brewing Ass'n., Supreme Court of Missouri, 31 S. W. Rep. 765.

Agreement for Interpretation of Building Contract.—A provision in a building contract referring to the architect "all disputes and all questions of doubt as to the tenor and intention of the drawings and specifications, or of the contract," embraces the question whether the contractor and his sureties are bound to refund to the owner of the building the amount paid by him on a mechanic's lien. Where the contract provides that the contractor shall deliver the building free from all incumbrances and shall furnish at his own cost all necessary materials. The architect is not disqualified to act as such referee because prior to so acting he was called to a witness in an action between the parties involving the matter in dispute.
Barclay v. Deckerhoof, Supreme Court of Pa. 33 At. Rep. 71.

Date of Contract not Essential to Lien.—The fact that an architect in his claim for a lien on a building, alleges the date of the contract for his services to have been two years prior to the actual date, will not defeat his lien.
Pac. Mut. Life Ins. Co. v. Fisher. Supreme Court of Cal., 42 Pac. Rep. 154.

When Partner may Assign to Himself.—An assignment of a partnership claim by a member of the firm in the name of the firm to himself individually is sufficient to enable his to sue the claim, the other partners not objecting.
Pac. Mut. Life Ins. Co. v. Fisher, Supreme Court of Cal. 42 Pac. Rep. 154.

Extent of Mechanics' Lien. An agreement was made between two persons for the sale of certain lots, for a specified sum, within a certain time after the date of the contract. The purchaser agreed to erect buildings on such lots, work to begin ot once. The seller agreed to deliver a good and sufficient title to the lots upon payment of the contract sum. The purchaser put up his buildings but never paid the money or obtained the deed. Liens were filed by his contractors for labor and materials. It was decreed that the liens covered not only the buildings but extended to the lots.
Shapleigh v. Hull, Supreme Court of Col., 41 Pac. Rep. 1108.

Recovery for Conract Void Under Statute of Frauds.—The value of work and labor supplied under a contract void by the statute of frauds is recoverable upon the theory that a benefit has been recovered, from which springs an implied undertaking to pay the value of such work and labor.
Banker v. Henderson, Supreme Court of New Jersey, 32 At. Rep. 700.

Liability for Dangerous Premises.—The mere maintenance of a dangerous nuisance upon one's inclosed premises gives no right of action to another, who, without necessity, and without invitation from the owner, either express or implied, voluntarily deviates from a public highway adjacent thereto, and, entering upon such premises, is injured in consequenee of the existence of such nuisance. If the nuisance complained of be by itself of such a dangerous character as that a person of reasonable discretion, entering upon the premises of another, inclosed or uninclosed, either from necessity or upon invitation, express or implied, could readily perceive its danger, and in so entering such premises, should suffer injury which he, by the exercise of ordinary care, could have prevented or avoided, he cannot recover. It is the duty of the owner of premises so to inclose a cellar which lies in dangerous proximity to a public street as to afford to one passing along such street, in the exercise of ordinary care, reasonable immunity against the danger of casually falling therein. If the owner fail to perform this duty, and a person exercising such care so falls and is injured, he is entitled to recover from the owner damages for such injury.
Hutson v. King, Supreme Court of Georgia, 22 S. E. Rep. 615.

BUSINESS MOSAICS.

In our description of the Heating and Ventilation of the Harrison School in Oakland in our last number we inadvertantly omitted the name of the firm supplying and installing the same—a piece of injustice which we hasten to rectify by stating the firm in question was the Morgan Heating and Ventilating Company who now have their officer's at Academy of Sciences Building, Market street, San Francisco.

Mrs. Scraply (during the fight)—Now have I made myself plain? Mr. Scraply—No, you were born that way.

Phœnix Pure Paint—Duresco and other specialities of W. P. Fuller & Co., deserve attention to be drawn to them.

Clara—Mr. Mason paid me a great compliment yesterday. He said I grew more beautiful every day. Maud—Well practice makes perfect, you know.—*Life.*

You cannot be much out of the way when you patronize home industry, certainly not when you use a California production that is first-class. Now P. & B. Building Paper answers this description; it can be had of the Paraffine Paint Co., 116 Battery street, who also are dealers in P. & B. felt and composition roofing.

The reader cannot be too often reminded that he consults his own comfort with at the same time a reduction of his coal bill, and in addition receives the thanks of his wife when he calls at 226 Post street and orders a gas cooking stove to be sent to his home.

She—Do you think it would be unmaidenly for a girl to propose to a man? He—Certainly not; if she is rich enough for two.—*New York Sun.*

J. L. Mott Iron Works are always found catering to those who think life is worth living, and of such are those who delight in lying enclosed on all sides by warm water, with their heads resting on Mott's Patent Bath Seat and Head Rest and meditating serenely on all manner of things and even going off for a short time into a *dolce far niente* dose, and when they once more awake to the stern realities of life, it occupies but a moment to lower the head rest, form a seat and while they are drying and fussing with the upper part of their body still leave the lower extremities a chance to get all the good they can out of their surroundings before the final emergence from the bright tub.

"Johanna, don't forget to dust the bric-a-brac." "No, ma'am; where do you keep the dust?"—*Detroit Free Press.*

L. E. Clawson & Co's. "Patent Hood or Throat and Arch-bar Combined" makes the best fireplace in the Market,

prevents all chance of fire from the fireplace or flue; the throat being in one solid piece and a great help to the bricklayer in making a neat job.

"Blykins has his own way in his home." "Yes. But his wife always tells him what it is going to be beforehand."—*Washington Star.*

So far Rischmuller's Door Opener and closer keeps the lead for perfectness, simplicity and durability, and we have heard no complaint from its users for want of these qualities, and even in houses where it is roughly handled by tenants it still stands this rough usage.

"Order in the court!" shouted the Judge. "This is the worst disgrace this court has suffered since I was elected to the judgeship."—*Indianapolis Journal.*

The Vulcan Iron Works exhibit some fine specimens of stable fittings the most complete of their kinds, and all kinds of architectural and ornamental iron work at their works, 135-34 Freemont street.

Bertie—Did you ever notice how Algie's face lights up when he talks? Mable—Yes; he's lantern-jawed, you know.—*Pick-Me-Up.*

A. Steiger Sons still keep up their reputation for first-class terra cotta work; and by dint of this keep their Architectural Terre Cotta to the fore notwithstanding the attacks made on that substance by the stone men.

She—Yes, they are engaged. I know she refused him twice, but the third time he proposed she accepted him. Her Husband—Serves him right.—*Brooklyn Life.*

CITY BUILDING NEWS.

Alvarado near Douglas. Frame cottage; owner, J. Heyman; cost $2500.

Broad near Plymouth Ave. Fire engine house; owner, City of San Francisco; architect, C. R. Wilson; contractor, A. Dahlberg; cost $4473.

California Ave. and Coso Ave. Cottage; owner, W. C. Hamerton; cost $1800.

Clay near Jones. All work on five flats except plumbing, gas-fitting, tinning, tin roof galvanized iron; owner, William Pickett; architects, Bugbee & Gash; contractor, George Eber; signed, Jan. 29; filed, Jan. 30; cost $5300.

Devisadero and California. Alterations; owner, L. M. Walter; contractor, Home Manufacturing Co.; cost $2500.

Eddy and Hyde. Plumbing and gas-fitting; owner, O. H. Hund, architect, A. C. Luitgens; contractors, Allen & Looney; signed, Jan. 17; filed, Jan. 20; cost $1594.

Ellis near Van Ness. Alterations, etc.; owner, Joseph Henry; architects, Copeland & Pierce; contractor, H. Pauls, signed, Jan. 28; filed, Jan. 28; cost $4045.

Fifth and Bryant. Elevators; owner, Main & Winchester; architect, H. Geil full; contractors, A. J. McNicoll & Co.; signed, Feb. 4; filed, Feb. 5; cost $1575

Ferry Slips Nos. 4, 5 and 6. Repairing Dolphins, etc.; owner, Board of Harbor Commissioners; contractor, B. McMahon; cost $2100.

Hampshire near 21st. Cottage; owner, J. P. Donahue; cost $2000.

Harrison and Main. Foundry building; owner, Moore Investment Co.; architects, Havens & Toepke; contractor, Thos. H. Day & Sons; signed, Jan. 20 filed, Jan. 21; cost $1134.

Homestead near 24. Cottage; owner, S. A. Born; cost $2500.

Howard street wharf, pier 2. All work for coal bunkers, etc.; owner, Beaver Hill Coal Co.; architect, Howard C. Holmes; contractor, Thos. H. Day & Sons; signed, Jan. 31; filed, Feb. 4; cost $8641.

Jackson near Nan Ness Ave. Mantels, etc.; owner, H. Sahlein; architects, Salfield & Kohlberg; contractor, L. and E. Emanuel.

Kearny and Post. Additions to White House; owner, R. Weill & Co.; architects, Pissis & Moore; contractor, L. and E. Emanuel; cost $1500.

Market street Ferry Depot Building. Stone work; owner, State of California; architect, A. Page Brown; contractor, C. F. McCarthy; cost $218,000. Carpenter work; contractors, Bateman Bros.; cost $48,000. Galvanized iron work; contractor, W. Cronan; cost $43,599. Painting work; contractors, Smith & Sons; cost $42,900.

Market near 6. Alterations to brick building; owner, Hale Bros.; contractor, L. and E. Emanuel; cost $3000.

Market near 5. Music stand, stairs and balustrades etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractors, Coppleters & Mockel; signed, Jan. 20; filed, Jan. 25; cost $9850. Fixtures, counters, etc.; contractors, L. and E. Emanuel; signed, Jan. 13; filed, Feb. 25; cost $2675.

Market next to Parrott Building. Alterations etc., owners, Prager Bros.; architect, Allen; contractor, John Hayes; cost $5000.

Montgomery and Washington. Alterations and additions; owner, Montgomery Block Real Estate Associates; architect, T. J. Welch; contractor, John Bath; signed, Jan. 23; filed, Jan. 24; cost $1483.

New Montgomery Grand Hotel. Alterations; owners, Fay & Foster; architect, P. J. Donahue; contractor, Rae Contracting Co.; signed, Jan. 28; filed, Jan. 28; cost $1185.

Page and Lyon. Three-story frame; owner, T. C. Van Issendorf; architect, E. J. Vogel; contractor, R. Currie; signed, Feb. 3; filed, Feb. 4; cost $7600.

Pine near Lyon. To build; owner, Peter Flach; architect, De Prosse & Meussdorffer; contractor, F. V. Steinnan; signed, Jan. 23; filed, Jan. 24; cost $4600.

Oak near Ashbury. Two-story frame; owner, Catherine Weineke; architect, H. Geilfuss; contractor, C. Schutt; signed, Feb. 1; filed, Feb. 3; cost $4300.

Sacramento near Walnut. Two-story frame; owner, Julius Frankel; contractor, G. G. Gillespie; signed, Jan. 15; filed, Jan. 15; cost $3870.

Sansome and Filbert. Additions; owner, P. W. Riordan; architects, Wright & Sanders; contractor, J. S. Mackey; signed, Jan. 27; filed, Jan. 27, cost $3040.

Shrader near Waller. Two-story frame; owner, Samuel Glass; architect, Wm Koenig; contractor, H. P. Conraday; signed, Jan. 14, filed, Jan. 16; cost $4100.

Stuart near Mission. Four-story brick; owner, E. R. Lilienthal; architect, Clinton Day; contractor, Riley and Loane; signed, Jan. 9; filed, Jan. 18; cost $14,443.

Third Ave. near Clement. Two-story frame; owner, C. B. Adams; contractor, A. J. Cloud; cost $2500.

Twentieth near Diamond. Two-story frame; owner and builder, J. A. McConnell; cost $5100.

Twenty-second and Noe. Cottage; owner and builder, H. Peterson; cost $2500.

Twenty-fourth and Douglass. Two frame cottages; owner, J. Anderson, cost $4000.

Valencia and Stable Alley. Three-story frame; owner, Rose A. Pickering; architects, Havens & Toepke; contractors, Ackerson & Paterson; signed, Jan. 23; filed, Jan. 25; cost $10,666.

Webster near Broadway. Plumbing work, etc.; owner, William B. Bourn; architects, Polk & Polk; contractor, H. Williamson; signed, Jan. 31; filed, Feb. 3; cost $2143.

York near 22d. Cottage; owner, Miss Maria Holtz; contractor, M. Holtz; cost $2000.

Remittances should be in the form of postal orders, payable to The California Architectural Publishing Company, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

OF great interest to all real estate owners, both present or prospective, is the question of improving the existing methods of transferring the title to land. The present methods are cumbersome, costly and not always effective, to say nothing of the repetition of useless labor now caused by the necessity of each intending purchaser examining all the previous recorded transactions and tracing the title back to the original possessor, a never ending task that grows more burdensome with each successive transfer. The Torrens' system of transferring title possesses many marked advantages, and has been gradually spreading, but at a discouragingly slow pace. It was adopted in Australia as far back as 1858, and by neighboring governments as they were convinced of its advantages.

But owing to the fact that the people in this country have no direct method of introducing reforms in our legislative bodies, we are almost entirely at the mercy of our politicians, and they as a rule are too much occupied with politics, to consider improvements in government. When they do submit such a proposition to popular vote, the people are quick to see and avail themselves of more advantageous methods as shown conclusively by the adoption of the Torrens' system by Cook County, Illinois, by vote of 82,536 in favor of the new system to 5,279 against it.

Here in California our State Legislature has been trying (unsuccessfully so far) to get its eyes opened to see the advantages of the system, and Bills have been introduced and committees appointed, but nothing has been achieved as yet. However we will continue to live in hopes, until some reform party succeeds in introducing the "Initiative" when desirable legislation can be voted on by the people without having to wait the pleasure of their servants. In another column will be found an interesting article giving many important details of the System.

N this number we publish a letter from Regent Reinstein of the University of California, in which he desires suggestions as to the best method of getting the best designs for a complete scheme for buildings and grounds at Berkeley. In our last two numbers we have threshed the matter of competition pretty well in so far as general application is concerned. From the results thus obtained it will not be a difficult matter to make up a program suitable for this particular case. A scheme for the competition evolved by the Chapters of the American Institute of Architects in California would, we believe, by the tone of the letter of Mr. Reinstein, be acceptable to the Regents and would very appropriately come from the said Chapters.

E call the attention of ambitious architects to the advertisement of the State Capitol Commission of Montana for a new State Capitol Building to be erected at Helena, to cost one million dollars. The commissioners state that four *adequate prizes* have been provided by law for the best designs, and full particulars can be had by applying in person or by letter to the Secretary of the Commission.

It is such an unusual thing to hear that *adequate* compensation is to be given to competing architects, that we cannot help commenting favorably on a proposition that is based on the principle of just reward for honest endeavor, and hope the terms offered will be considered by the profession as adequate as they are held to be by the Commissioners.

HE following communication was read at the last meeting of the San Francisco Chapter of the American Institute of Architects.

To the California Chapter of the American Institute of Architects.

Gentlemen:—There is now an endeavor amongst the artistic and æsthetic circles of the community, to raise a sentiment among the public and those interested, in favor of the adoption of a general plan, forming a harmonious whole, for buildings for the State University at Berkeley; so that when it should be decided to put up any other building on the grounds, said building should form part of this general scheme. This seems to me a laudable object and one that should arouse the sympathies of every true architect and one that should especially be taken hold of by your Chapter as well as by the Southern Chapter forming as they should do the crystallization of Architectural opinion in California. An opinion coming from those two bodies ought to have considerable weight and influence and mold public opinion in the direction indicated.

I therefore respectfully suggest that an opinion from your members be obtained as to the matter and so as to bring it out definitely to have it decidedly expressed in regard to at least these two questions:

1st. Are the Buildings now on the University grounds at Berkeley generally convenient or beautiful and do they form an Architectural or pleasing ensemble, or sufficiently so to form part of some complete scheme?

2d. Would it be best in a case of this kind to work to some complete and united plan; so that all future buildings should be built in regard to such united and complete plan?

An answer to these two questions would give an indication of professional ideas on the subject—to reinforce the same, means should be taken to obtain the opinion of outside Architects and Artists on said questions—so that a consensus of the ideas of the artistic world may be obtained and have its due influence on the rest of the community and those having charge of the interests of the State.

Yours respectfully,
W. Jones Cuthbertson.

This resulted in the following Resolution being passed by the San Francisco Chapter of the American Institute of Architects:

Resolved—That most of the buildings now on the grounds are absolutely incompatible with any artistic arrangement and that it is absolutely necessary in order to secure a future artistic and complete general plan or arrangement of the grounds that a definite and well arranged program be prepared.

TORRENS' SYSTEM OF LAND TRANSFERS.

ONCERNING that realty with a good title is the safest of all investments, says the *Call*, how shall the investor who purchases a parcel of land or lends his money on what he considers to be the security of a good title, know that his money is safe? What redress has he if the title prove defective and in consequence his investment be a bad one? Cognizant of these facts, legislators throughout the civilized world have racked their brains in their efforts to throw safeguards around the ownership of land and to enact such laws and forms in the transfer of same as would afford proper protection to the varied and complicated interests concerned.

The good reports from the city of Chicago of a system of registration of titles, recently adopted, and the appointment by several of the States of commissions to examine into the merits of the Torrens land-title law in force in Australia and in some parts of England, and from which the Illinois statute originated, makes the present a fitting time for a few suggestions concerning it.

From a lengthy paper read before the Six-thirty Club recently, by Warren Gregory, of Chickering, Thomas & Gregory, the following excerpts are taken:

"The two great systems which exist to-day in the records of title are, first, a registration of deeds, and, secondly, a registration of title. It is the former which has prevailed almost universally in the United States from the earliest times.

"Although the transfer of real property is purely a local matter governed by the laws of the State in which it is situate, nevertheless, the general features of this system are the same in all the States. Its sole efficiency lies in the fact that by it is preserved a permanent record. The record of the deed gives it no additional validity between the parties whatsoever. The sole purpose of recording a deed is to give notice. Thus, section 1217 of the Civil Code of this State is 'that an unrecorded instrument is valid as between the parties thereto and those who have notice thereof.' Nor does the transcription of the document in a special book give it any additional validity. This is simply a matter of convenience.

"Defects in the present system are obvious. Lord Cairns, when introducing into Parliment a bill which I shall notice hereafter, declared that 'the objections to a register of deeds are so manifest that hardly any person in the present day would venture to propose it. It would not simplify title in the least. It only puts on a form of record the whole of that multitude of deeds and conveyances of the extent and complication of which we already have so much reason to complain. You have to investigate and search as before; in addition to that you have to pay for searchers in the registry and also to pay in some shape or other the expenses of placing the deeds upon it.'

"With this brief statement of a few of the radical defects in the system of the registration of deeds I pass to a discussion of the second system, viz., registration of title. In its essential features it is practically the system introduced in South Australia in 1858 by Sir Robert Torrens, but inasmuch as the details of the scheme differ somewhat in the various attempts which have been made to introduce it in this country I will take as the basis the recent act passed in the State of Illinois for the County of Cook. I do this for the reason that the act introduced in the Legislature of California in January of the last year had one feature quite unlike the Torrens system. This bill passed the Assembly at Sacramento, but was withdrawn in the Senate. A general feeling prevailed that not enough attention had been given to it to enable the Senators to vote intelligently.

"The difference between a registration of a deed and the registration of a title is fundamental. The essential feature of the latter is that the title passes only by the entry of the transfer upon the official register, and by the virtue of a deed between the parties. The title thus transferred and authenticated gives an indefeasible title. The owner therefore does not depend upon a deed from his grantor but upon a certificate of title issued to him by the official registrar. It is therefore precisely analogous to the transfer of corporate stock or of a ship.

"This brief statement would seem to be charming in its simplicity and effectual in operation, but the plan by which it can be worked out presents by no means an easy problem. First, the method by which land can be brought under the system.

"In England and Australia parties are controlled by no constitutional limitation, and therefore have the right arbitrarily to fix a date upon which all persons then registered shall be admitted to be the rightful owners of the property, or to create in the Registrar absolute authority to pass upon the title of every applicant. Such a ruling is not possible in the United States. For, if A and B each claim a tract of land and A succeeds in getting his title first registered, B cannot thereby be deprived of his right to apply to the courts, for, if so, the Registrar would have deprived him of his property without due process of law, contrary to the fourteenth amendment. It is, therefore, essential, in beginning, to get over this constitutional objection. The method adopted in Illinois is as follows: A person desiring to have his property registered must make a verified application to the Registrar setting forth in detail the description of his property, whether he is married or single and has estate in the land, and whether the same be occupied or not.

"Thereupon the Registrar, through two examiners (attorneys-at-law) authorized to be employed by him, causes an examination to be made of the title and as to the truth of the matter set forth in the application. He makes minute inquiry as to the possessory right, and posts up a notice on the property for a period of ten days, requiring all persons who have any interest in or claim to the land to appear before the granting of the certificate of title. If it appears to the Registrar that the facts stated in the application are true there is issued to the applicant a certificate of title, and from that time forth the land is within the operation of the act. The form of the certificate is somewhat as follows:

"'John Doe of San Francisco, aged twenty-five years, unmarried, is the owner of an estate in fee simple in the following land, subject to the estates, easements, incumbrances and charges hereunder noted.

"'Witness my hand and official seal this twentieth day of December, 1895. ——, Registrar.'

"As soon as the certificate is granted the Registrar makes and publishes in a newspaper a list of all registrations effected during the preceding week and also posts the same in his office. It is then provided that no person shall commence any action for the land or assert any interest therein adversely to the first certificate unless they make known their claim to the Registrar within five years after the first registration. It is no exception to this rule that the person is a minor, a lunatic or under disability. It will be noticed that this last provision attempts to meet the constitutional objection by placing the foundation of the title, not upon any act of the Registrar, but upon lapse of time. The proceeding is akin to a suit to quiet title brought by then owner against all persons known or unknown. A title acquired by a decree in such action has frequently been declared valid by the Supreme Court of the United States. That the Legislature has power to create this statute of limitations or to shorten one already existing is undoubted.

"An objection may at once be here raised, that this proceeding would be a sort of hornet's nest stirring up all the slumbering black-mailers, who would hasten to file a claim on every certificate of title issued. This is probably so, but it would have the advantage of bringing them to the light, for, having once asserted their claim upon the register they are compelled to bring an appropriate action to assert their claim within this period of five years. The machinery of the courts would thus be set in motion and the true owner would have the right to prosecute it vigorously to a conclusion.

"Possessory title is acquired after the land has been once registered, and it is entirely optional whether it be registered or not, it is transferred by a surrender of the certificate to the Registrar and an issuance of a new one to the grantee. Between the parties this may be done by any of the recognized modes of conveyance, and that forms a contract between them which may be inforced in law, but, as stated before, its validity as a conveyance does not exist until the certificate is issued.

"If the Registrar is satisfied that the supposed grantor appears upon the register as the owner of the land, he notes

upon the original certificate the fact of the transfer, issues a duplicate new one to the grantee, upon which shall appear the volume and page in which the new certificate is registered. And here the second constitutional objection arises.

"Let us suppose that A has acquired a certificate to land. The action of the Registrar was in reality erroneous in issuing this certificate, and B is the true owner. Both the examiners and the Registrar have made a mistake. Before B can make known his claim A has transferred the property to C, who of course relies upon the certificate and takes absolute title. Has B a right to proceed in an action at law to set the transfer aside? Unless some provision were made in the act for this contingency, the answer must be 'yes,' because otherwise the Registrar would have usurped the functions of a judge; that is, when he pretends to decide as between A and B he is really exercising a judical function, and it not being in accordance with due process of law the proceeding is a nullity. To obviate this the following section is incorporated in the act:

"All dealings with the land or any estate therein, after the same has been brought under this act, and all liens, incumbrances and charges upon the same subsequent to the first registration thereof, shall be admitted to be subject to the terms of this act and to such amendments and alterations as may hereafter be made. The bringing of land under this act shall imply an agreement which shall run with the land that the same shall be subject to the terms of the act and all amendments and all alterations thereof.'

"In other words, by bringing his land under this act the owner makes an agreement that the registrar may supervise all transfers of title that may hereafter take place.

"The registrar is created an arbitrator for the purpose of deciding those questions. It has frequently been held that an agreement to submit a matter to arbitration, as, for example, the ordinary arbitration clause in insurance policies, is valid, and although this question must first be decided in the courts before absolute safety is felt, it would seem to be a valid condition; at least such was the opinion of the eminent constitutional lawyers who passed upon the Illinois act.

"The provision extending the statute for five years to minors and infants is one which has occasioned much difficulty. Ordinarily, of course, the statute of limitations itself does not run as against a person who is under disability. But if we were to except minors or lunatics from the operation of this act it would be necessary to examine every title, for certainty could not exist as long as there was a possibility of an adverse claim.

"No clear starting point can be had which does not cut off all claimants alike. This section was taken from the burnt record act of Illinois, already referred to as amended in 1887, and which amendment has thus far proved satisfactory.

"The certificate granted by the Registrar is an absolute guarantee of title. Should the Registrar and his examiners make a mistake the State is responsible. But is is urged that if A succeeds in getting a certificate to land to which B is justly entitled, B may not wish to have damages merely, but may wish his identical land restored. It may be a homestead or dwelling to which he is particularly attached. To this the answer is, the possibilities of error are very few. In the course of eighteen years in New South Wales and Tasmania not a single claim has been made against the Government.

"There is of course the possibility of a certificate being forged, but this exists to even greater extent in the present system, and the cases at present in which a notary has been deceived as to the identity of the person making the oath are exceedingly rare.

"So long as A retains the title B is not in any way prevented from still recovering the land from him in an action. But if A transfers it to C, an innocent holder, then B is compelled to make his claim for damages to the State.

"In Australia there has been created an insurance fund and a tax of one-fifth of one per cent is levied upon every transfer for the purpose of indemnifying the Government. This feature has not been incorporated in the Illinois system, owing to the five year limitation clause. Where, as in Australia, an arbitrary time was fixed, it was found necessary to guard against the possibility of a mistake, but it was thought in Illinois that the five year clause would g ve ample opportunity for adjusting every possible case.

"The limits of this paper forbid a detailed examination of all the features of the act. Once given a conclusive starting-point, its workings appear to be simple and perfectly feasible, and it seems to be, in the opinion of the best real-estate lawyers who have seen the plan in actual operation, that there is no insurmountable objection to the application of the system to this State and country.

"It is commonly urged that the fact that it has worked remarkably well in Australia, where the source of title is very near and where the complications in transfers are very few, is no argument for its adaptability to this country.

"Lord Coleridge, late Chief Justice of England, in 1872 in speaking of the applicability of this system to England declared he 'had never been able to perceive the obstacle to applying to land the system of transfer which answered so well when applied to shipping, but as his learned brethren one and all had declared that to be impossible he had become impressed with the belief that there must be something wrong with his intellect, as he failed to perceive the impossibility. The remarkably clear and logical paper which was read by Sir R. R. Torrens relieved him from that painful impression, and the statistics of the successful working of his system in Australia amount to demonstration, so that the man who denies the practicability of applying it might as well deny that two and two makes four.'

"It seems to me that with us in California the application of the system should be particularly easy. We have had, under the control of our Spanish land grants, a well-known instance of an attempt to form a conclusive starting point by the application to the commission of 1852. We are still a comparatively young State, and whatever errors are now upon our land-title records will be perpetuated as time goes on. It is certainly a subject for consideration as to the advisability of a thorough study of this question in order to impress the Legislature with its importance."

WASHINGTON CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

AT the regular monthly meeting of the Washington Chapter of the American Institute of Architects, held Friday evening, February 7, 1896, the following resolution was passed:

"We, members of the Washington Chapter, American Institute of Architects, wish, both as a body and as individuals, to protest against certain statements published in *Harper's Weekly* of December 28, 1895, the Utica *Globe* of January 18, 1896, and other papers of recent date, in which Mr. Edward P. Casey, son of Genl. T. L. Casey, is put prominently forward as the Architect of the new Congressional Library building in this city.

We are familar with this building from its beginning to the present time, and feel that no one can, with propriety or honesty, be entitled to the credit as Architect of this building except J. L. Smithmeyer and Paul J. Pelz. They have devoted the best years of their lives, from 1873 to 1893, in perfecting the plan and in designing the exterior and interior of this building.

Official documents prove that the work was commenced by act of April 15, 1886, under the direction of Smithmeyer and Pelz, Architects. In 1888, Genl. T. L. Casey, father of the alleged Architect, was placed in charge, with directions to complete the building according to the drawings of Smithmeyer and Peiz, omitting four of the stackrooms in the interior courts.

When Paul J. Pelz was discharged, March 29, 1892, Genl. T. L. Casey, U. S. A., wrote him that "as you have entirely completed the designs for the architectural characteristics and features of the building for the Library of Congress, both of the exterior and interior, * * * I have to state that your services will be no longer required by the Government." The alleged Architect, Edward P. Casey, was not employed in any capacity on the building before this date.

We desire in justice to two members of our profession, that the press of the country will publish this protest, and we further recommend the American Institute of Architects to take official action in reference to the matter.

(Signed)

Robert Stead, President.
Glenn Brown, Secretary.

UNITED STATES DEPARTMENT OF AGRICULTURE, DIVISION OF FORESTRY, WASHINGTON, D. C., MARCH 2, 1896.

Walter G. Berg, Esq., Principal Assistant Engineer, Lehigh Valley R. R., Jersey City, N. J.

Dear Sir:—Replying to your request for information regarding the status of the timber test work, especially as regards the kinds tested, number of tests and the data worked up, which I understand you desire in order to keep the American Society of Civil Engineers informed as to the progress of this work most interesting to them, I may make the following brief statement:

The total number of tests made at the mechanical laboratory to January 31st, was 39,437, which during February will be brought up to about 41,500, when all the material collected will be tested and the work for the present abandoned under the orders of the Secretary of Agriculture.

In the above number the moisture determinations which accompany the tests are included reducing the actual number of mechanical tests to probably 35,000.

The material for these tests was specially collected in the woods, comprising 356 trees representing 32 species mainly of southern growth. The distribution of tests by species stands as follows:

Southern pines,	5	species	20,341
Northern pines	2	"	1,097
Bald cypress			4,126
White cedar			243
Oregon fir,	10	pieces	276
Conffers			26,083
Gum, red			867
Oaks, white,	4	species	4,052
" black,	5	"	4,301
Hickory,	8	"	3,011
Ash	2	"	147
Elm	2	"	409
		Total	39,437

You will note, that of Northern timbers only the white and Norway pines have been tested in a small way and of Oregon fir only a few random sticks sent in by an interested party; all others are southern.

Of these sticks only a portion on Longleaf pine was compiled and worked up in Bulletin eight. There are, however, now the entire data on Southern pine worked up in manuscript. The average results will presently be stated in an eight page circular, the status of the printing fund of the Department preventing for the present the issue of a full bulletin. There will then still remain nearly as many data referring to other species undigested.

You will however, understand that this test work differs from other testing done hitherto, in that it places reliance only on large numbers. Hence, for instance, the 276 tests on Oregon fir would hardly warrant us in drawing any conclusions, they are not better than any other tests, except that their moisture condition is noted, which is to be sure one important advantage.

On the other hand, for the Southern pines we may claim to have such a series of data as to make It unnecessary for anybody else to test these timbers again; they cover such a large number under all sorts of conditions that absolute confidence in the reliability of the data for the range of strength in the species should be accorded to them.

At the same time the confusion existing in engineers' tables with regard to the kind of pine (names or species) should not be permitted any longer, especially since the various species promiscuously referred to as southern pine, yellow pine, pitch pine, etc., differ up to twenty per cent in average strength values.

But the mere establishment of the strength values does not exhaust the usefulness of these data; they were to be used, and will be used, if we are permitted, to establish such relationships as will lead to the formulation of *rules of inspection*—the most important object of these investigations—as a result of which the engineer or other consumer will be enabled to judge of the comparative value of the piece in hand.

For such purpose the existing data may sometimes not even prove sufficient and would have to be supplemented by new data obtained under special conditions.

One of the investigations of this nature directly interesting to the engineer is that on the relation of tests on large and small sizes. Here, too, our number of tests is still too small for safe generalization, although not less than 340 large columns and beams have been tested, with the interesting and readily explained result that for symmetrically

cut beams (heart in center) the values are as large and sometimes larger than for the average of the small pieces cut from the same beams; while the columns give mostly but not always lower values, yet the results are so variable, that no trustworthy numerical data have been attained, the range in individual cases being as much as fifty per cent.

At present the work will be abandoned for the fiscal year, the allotment of funds having been exhausted, about $40,000 in all having been spent so far. An attempt to work up the test results, at least for data of strength, will be made.

In the reading of the appropriations for this Division for the next year the reference to this line of work has been left out and a discontinuance is probably contemplated. A bill making special appropriation for its continuance has been introduced in the Senate (S. 1214), but its passage is exceedingly questionable.

Regretting, then, that I cannot report to you a more hopeful outlook.

Yours very truly,
(Signed) B. E. Fernow, Chief.

THE TALL OFFICE BUILDING ARTISTICALLY CONSIDERED.

AN unpromising subject has been tackled by Louis H. Sullivan when he discants on "The Tall Office Building Artistically Considered" in *Lippincotts' Magazine*.

Thus considered the problem resolves itself into the following, according to Mr. Sullivan: "How shall we impart to this stark, staring exclamation of eternal strife, the graciousness of those higher forms of sensibility and culture that rest on the lower and fiercer passions? How shall we proclaim from the dizzy height of this strange, weird, modern housetop the peace evangel of sentiment, of beauty, the cult of a higher life?"

A problem indeed of great difficulty; for the associations of a tall office building are such that the cult of a higher life (except in a physical sense) has as much chance to grow therein as a rose on the top of a granite boulder.

Another difficult problem to solve is what are the "higher forms of sensibility and culture that rest on the lower and fiercer passions." It must be an unstable resting place fer those higher forms.

The normal type of office buildings consist of:

"1st, a story below-ground, containing boilers, engines, of various sorts, etc.,—in short, the plant for power, heating, lighting, etc., 2d, a ground-floor, so-called, devoted to stores, banks, or other establishments requiring large area, ample spacing, ample light, and great freedom of access. 3d, a second story readily accessible by stairways—this space usually in large subdivisions, with corresponding liberality in structural spacing and in expanse of glass and breadth of external openings. 4th, above this an indefinite number of stories of offices piled tier upon tier, one tier just like another tier, one office just like all the other offices,—an office being similar to a cell in a honey-comb, merely a compartment, nothing more. 5th and last, at the top of this pile is placed a space or a story that, as related to the life and usefulness of the structure, is purely physiological in its nature,—namely, the attic. In this the circulatory system completes itself and makes its grand turn, ascending and descending. The space is filled with tanks, pipes, valves, sheaves, and mechanical etcetera that supplement and complement the force-originating plant hidden below-ground in the cellar. Finally, or at the beginning rather, there must be on the ground-floor a main aperture or entrance common to all the occupants or patrons of the building."

The practical way of treating such a building is very justly given by Mr. Sullivan:

"Beginning with the first story, we give this a main entrance that attracts the eye to its location, and the remainder of the story we treat in a more or less liberal, expansive, sumptuous way,—a way based exactly on the practical necessities, but expressed with a sentiment of largeness and freedom. The second story we treat in a similar way, but usually with milder pretension. Above this, throughout the indefinite number of typical office-tiers, we take our cue from the individual cell, which requires a window with its separating pier, its sill and lintel, and we, without more ado, make them *look* all alike because they *are* all alike. This brings us to the attic, which, having no division into office-cells, and no special requirement for lighting, gives us the power to show by means of its broad expanse of wall, and its dominating weight and character, that which is the fact,—namely, that the series of office-tiers has come definitely to an end."

He then remarks that the chief characteristic of the tall office building is its loftiness—and that the man that lives of his life and for his life in the fullest, most consummate sense "must realize at once and with the grasp of inspiration that the problem of the tall office building is one of the most stupendous, one of the most magnificent opportunities that the Lord of Nature in his beneficence has ever offered to the proud spirit of man.

"That this has not been perceived—indeed, has been flatly denied—is an exhibition of human perversity that must give us pause."

I must be one of those exhibitions of human perversity for I fail utterly to see it in that light.

The *raison d'etre* of the tall office building, the mercantile, financial and other commercial pursuits for which it is used, fail to arouse in the ordinary man the enthusiasm exhibited by our essayist. It is no doubt a fact that the tall office building is tall, but that fact alone cannot enthuse the artist. That thrill cannot come over him as he gazes up the lank sides of the tall office building although it does soar into the heavens and may be adorned in the most artistic manner, that comes over him as he gazes up the straight majestic trunk of the mighty Redwood and finally feasts his eyes upon the gently swaying mass of foliage outlined against the heavens—or even, to a less extent, as he follows with his eye the outlines of the tapering spire, massive tower or dome of some building dedicated to the higher susceptibilities of human nature.

Never can the tall office building vie with either of these in exciting artistic feeling; for the idea represented by it is an idea entirely incommensurate with its size and as well may the frog try to inflate itself to the size of the ox as may the tall office building attempt to take hold of a natural and artistic nature in such a way as such other things we have mentioned in our example.

As Mr. Sullivan says: "The law is—*form ever follows function*"—therefore when the function is unenobling the form must be the same, and the more this function is exhibited as it should be by the true architect the truth is

DINING ROOM, RESIDENCE OF MRS. A. M. WOHLER.

LOWER HALL, RESIDENCE OF MRS. A. M. WOHLER.

more exposed, and although he will naturally show the best side possible of that function, for he detests anything hideous—still its natural infirmity must be brought to light, and must cast its blighting shadow upon the whole edifice—and the only effect on an artist would be the admiration caused by the perfect way in which its functions have been sublimated.

If we are to believe that the author feels that the exhibition of the functions of the office building alone without sublimation enough to make them unrecognizable can excite those thrilling effects upon the artists nature which he portrays, then it is hard to reconcile this with his wind up.

"When we know and feel that Nature is our friend, not our implacable enemy,—that an afternoon in the country, an hour by the sea, a full open view of one single day, through dawn, high noon, and twilight, will suggest to us so much that is rhythmical, deep, and eternal in the vast art of architecture, something so deep, so true, that all the narrow formalities, hard-and-fast rules, and strangling bonds of schools cannot stifle it in us—then it may be proclaimed that we are on the high-road to a natural and satisfying art, an architecture that will soon become a fine art in the true, the best sense of the word, an art that will live because it will be of the people, for the people, and by the people."

W. J. C.

CORRESPONDENCE

SAN FRANCISCO, March 14, 1896.

The California Architect and Building News

DEAR SIRS:—The Board of Regents of the University of California has set apart April 28, 1896, to discuss the best methods of obtaining a permanent grand plan for the grounds and buildings of the University at Berkeley, California.

It would seem that the Board is required by law to have a competition, that is, it is required to "advertise for plans."

Under these circumstances, as I have been requested to make a report to the Board on this subject, you would oblige me greatly, if you would give me your judgment as to the best method of having such a competition to secure the selection of the best plan.

It has occurred to me that there should be a Board of three or five experts advisory to the Regents—that the majority of this Board should be selected by the ten leading architects in the Eastern States, and the balance to be selected by the five leading architects of this State. This Board of experts or Advisory Board might have added to it, if it were deemed advantageous, three members selected from, say Harvard, Yale and Chicago Universities, as they would be presumed to have knowledge and experience in such matters, but the final decision would rest with the Board of Regents.

The Board of Regents would send to all competing architects, a topographical map, and perhaps papier mache cast of the University grounds, and full photographs of the surroundings and the present buildings on the grounds, though they are considered as merely temporary.

The Faculty would make out a list of the requirements for an ideal University, which the competing architects would be expected to plan for this site.

The time given for the competitors will depend largely on the views of the leading architects of the Country in that regard. Without knowledge on that subject, we figure that six months would be sufficient for that purpose.

This is a State University, with assets of about eight million dollars, and a permanent tax for its support of one mill on the dollar of the increasing taxable wealth of the State.

The buildings are to be erected as required, but it is expected that the next Legislature of the State will grant the University two hundred and fifty thousand dollars for building purposes, and it seems probable that say a million dollars will be expended for improvements within the next ten years.

It is hoped that the Regents will give from five thousand to ten thousand in prizes in the competition. I should assume that the architect whose plan was selected would have the supervision of all buildings erected during his lifetime.

For your views on these points, and everything germane to this subject, prior to April twentieth, I should be greatly obliged.

Yours very truly,

J. B. REINSTEIN.

NEW YORK, February 27, 1896.

DEAR SIR:—We have just received a copy of your January number, in which there is a long article concerning the University of Berkeley, quoting several architects opinions in the matter of the proposee work, and though we are quoted correctly, the portion quoted is not the sense of our letter.

We hold practically the same views as Mr. Sullivan and are absolutely opposed to competitions. We undertook, however, to explain the best conditions under which a competition could be conducted, if one is absolutely necessary.

We would appreciate a correction from you.

Yours truly,

CARRERE & HASTINGS.

[We did not make Messrs. Carrere & Hastings' opposition to competitions sufficiently prominent and are glad of the opportunity of correcting any wrong impressings made by not publishing the whole of their letter.—ED.]

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

FRAUD OF CONTRACTOR AND OWNER WILL NOT PREVENT LIEN.—In an action to enforce a mechanic's lien in favor of a subcontractor, notwithstanding the contractor had covenanted that no liens should be filed, on the ground that though the title stood in the name of the sister of the contractor, the latter was whole or part owner of the property, and the whole scheme of having it put in her name, and his making the contract and covenant was a mere device, participated in by both of them, for the purpose of misleading and defrauding strangers to the title who should furnish labor and material, the Supreme Court of Pennsylvania held such evidence sufficient, though it would not be to create a resulting trust adverse to the holder of the legal title.

Brilman v. Heron, 32 Atlantic Reporter, 294.

NOTICE INVALID AGAINST MORTGAGEE.—A claim for material furnished in building two houses under separate contracts, filed as a lien against one of them, is invalid as against a mortgagee of the building, though the owner has consented to a decree establishing the lien in a suit by the claimant against him.

Leftwich Lumber Co. v. Mut. Building, etc., Ass'n, Supreme Ct. Ala. 18 So. Reporter, 48.

WHAT LAND IS SUBJECT TO MECHANIC'S LIEN.—Where a statute declaring subject to mechanic's liens on a building the land on which it is situated, together with so much of the land about it as may be required for the convenient use and occupation of such building, the whole forty acre tract on which a dwelling is located is not subject to liens, it not being meant that sufficient land about the building to support the owner while living there will be subject to a lien.

Cowan v. Griffith, Supreme Ct. Cal., 41 Pac. Reporter 42.

CONTRACT TO CONTINUE AFTER DEFAULT A NEW UNDERTAKING.—In an action to recover the value of work, labor and materials, it appeared that a party had contracted with a third person to do certain work in another's residence; that the contract was partly performed when it was violated by such third person, in omitting to make payments; that the first party refused to proceed, when the owner requested him to finish the work and that he would pay him. The Court held that this was a new promise, and not the promise to pay the debt of another which would have been in the statute of frauds, and should have been in writing.

Schulz v. Cohen, 34 N. Y. O. Sup. 927.

BURDEN OF PROOF OF NEGLIGENCE IN DANGEROUS PREMISES.—Where a building falls without any apparent cause, in the absence of explanatory circumstances, negligence will be presumed, and the burden is upon the owner to show that he exercised ordinary care to keep it in a safe condition; but where it appears from such explanatory circumstances that the cause of the fall of the building was a latent defect in the construction, and there is no evidence tending to show such cause was owing to the negligence of the owner, the burden rests upon the party asserting such negligence to show that such cause might have been discovered and removed before the accident by the exercise of ordinary care on the part of the owner.

Ryder v. Kinsey. Supreme Ct. Minn., 64 N. W. Rep. 94.

LIABILITY OF SURETIES ON CONTRACTOR'S BOND.—A slight departure from the plans and specifications of the work, without the knowledge of the sureties upon a contractor's bond, where the alterations are authorized by the contract the performance of which the bond was given to secure, will not relieve the sureties from liability upon the bond. Nor will the fact that the principal procured the signature of a surety on the promise that he would afterwards obtain the signatures of others, which was not done, relieve the surety from his obligation on a bond delivered, approved and filed.

Risse v, Hopkins Planing-Mill Co., Supreme Ct. Kans. 40 Pacific Report r. 904.

BOOKS AND PERIODICALS.

PROCEEDINGS OF THE FIFTH ANNUAL CONVENTION OF THE ASSOCIATION OF RAILWAY SUPERINTENDENTS OF BRIDGES AND BUILDINGS, held in New Orleans, Louisiana, Oct. 15 and 16, 1895.

We have received the above from the Secretary of this Association, S. F. Patterson. It contains a mass of valuable information, results of experiments and other matters of not only great value to Superintendents of Railroad Bridges but also to the architect and builder at large.

The exhaustive Report of Commission on "Strength of Bridge and Trestle Timbers," we published in our last November number. As of special Pacific Coast interest we publish in this number the Results of Experiments made by the Southern Pacific Railway and of Prof. Wing of Stanford University on Oregon Pine and Redwood.

APPENDIX T.

TESTS OF DOUGLAS FIR AND CALIFORNIA REDWOOD MADE FOR THE SOUTHERN PACIFIC RAILWAY BY MR. JOHN D. ISAACS.

Mr. John D. Isaacs, assistant engineer, Southern Pacific Railway, summarizes the results of tests made under his direction as follows:

"Regarding strength of Oregon pine (properly Douglas fir) and Redwood timber, the following are the averages of many experiments (neglecting abnormal results) made several years prior to 1895, by our company under my supervision."

Ultimate Breaking Strength in pounds per square inch.

	Douglas Fir.	Redwood.
Tensile	15,900	8,000
Crushing	6,000	3,000
Shearing parallel with grain	600	276
Modulus of elasticity	1,272,000	600,000

Allowable Safe Unit Stresses in pounds per square inch.

Used in practice under ordinary conditions, by Mr. Isaacs.

	Douglas Fir.	Redwood.
Tensile	1,600	800
Crushing	1,200	600
Shearing parallel with grain	150	50
Bearing perpendicular to grain	400	150

"In trestle work red wood is principally used for sills, posts and caps, or wherever the timber is subject to rapid decay, although creosoted fir timber has been replacing red wood for the latter purpose on the Southern Pacific railway system.

"The tests were made as follows: A large number of logs were cut from different portions of trees from various localities and exposures. After air-seasoning the logs were cut into one inch square pieces; half of the pieces from each section were tested by tensile and the other half by compressive strain, the pieces being turned down to a round for about eight inches in length. All pieces were tested, except such showing sap or splits running across the grain. The diameters were gauged very carefully. The machine was a home-made apparatus of about 25,000 pounds capacity, with a pressure gauge for recording pressures. The shearing tests were made by pulling a half-inch round out of some of the one-inch pieces. The modulus of elasticity was determined by bending pieces of various dimensions.

"All of the experimental results have been checked at various times by isolated experiments. An extended experience with a great variety of timber structures has confirmed my opinion that the units given above are just right for good practice.

"While the testing methods, as compared with more efficient laboratory machines, may appear somewhat crude, the results obtained are probably just as near the truth, considering the varying characteristics of different pieces of the same species of timber."

JOURNAL OF THE WESTERN SOCIETY OF ENGINEERS, contains papers, discussions, abstracts and proceedings.

This journal is full of interesting matters for engineers

and architects. It contains a specially complete series of monographs on Hydraulic Cement covering the following questions. 1. Relative qualities of the several Portland and natural cements at present in general use. 2. The extent to which the testing of cement is useful in connection with various classes of work. 3. What nature of testing is suitable. 4. The essential points which should be covered in specifications as to testing cements. 5. The influence of the amount of water used in forming pastes and mortar. 6. How the several cement mortars are affected by cold, both in laboratory and in practical work. 7. How mortars are affected by tempering. 8. What specifications should require as to mortar and mortar mixing. 9. How cement mortars are affected by different kinds of sand. 10. What extent cement mortar plasters can be relied upon to adhere to cement mortar concretes, especially when Portland cement is used for plaster and natural cement for concrete.

Also notes on Dry Docks and a paper covering the whole field of Oriental Rail Roads including remarks on the railroad stations—wherein it is noticed that there are very few stations built in the countries under English rule where the interior finish is given much attention while the exteriors are most of them very artistic and beautiful especially the one at Bombay which is said to be the finest in the world. It is in the Gothic style with an Oriental feeling.

Here is an account of how the elephant is used in a lumber yard.

"One of the great sights of Rangoon is the elephants working in the saw-mills and lumber yards. They were formerly employed in all the large mills but at present only one continues to use them, and in this yard we saw fourteen at work, from sweeping the floor to piling up timbers which were said to weigh one ton.

"We saw an elephant walk up a to a stick of timber about fourteen inches square, twenty-five to thirty feet long, which they said weighed one ton, get down on his knees, run his tusks under it, throw his trunk over it, get up and carry it to a pile of similar sticks and put it down with one end resting on the pile and the other end on the ground. He then walked around to the end on the ground, curled up the end of his trunk and with it pushed the timber up on top of the pile and then went to the other end and pushed it up so it lay even with the other timbers."

RESIDENCE OF MRS. ANNA M. WOHLER, 2025 SACRAMENTO STEEET, E. J. MOLERA, ARCHITECT.

THIS residence fronting Lafayette Park is in one of the most fashionable locations in the city. The lot on which it is built is 65 x 137½ feet. The architect has endeavored to follow, for the outside and the inside of the building, a pure Renaissance style. Our illustrations taken from photographs of the edifice will show the successful way of the treatment of the subject.

The front measures fifty feet in width excluding the side entrance. It is two stories in height; the depth of the building is a little over fifty feet with an L where the kitchen, pantry and grill room are built. Besides the residence proper an outside house for the man servant and tool house is built in the rear.

The house contains two parlors, dining-room and three principal rooms all 15x24 feet besides a large hall 16x16 feet, three bath rooms, four additional sleeping rooms, three toilet rooms, etc.

Care has been taken that all the material used should be of the very best kind obtainable and it has been built with the greatest care, each contractor having been allowed all the time necessary to do the best work.

One of the features of this residence is the main stair hall 16x16 feet, built all of best quartered oak with fine carvings. The entrance to the hall in front of the front door consists of an arched way with pilasters on each side of the wall and pilastrettes to support the arch. The stair-case, richly carved, is at one side and lands on a gallery boarded around with a fine balustrade. Oak pilasters support the gallery and the dome which covers this hall. Nearly all the rooms open into this hall or the gallery that surrounds it, and as the top of the dome is covered with an art colored ceiling light 11x11 feet, there is light and ventilation in all parts of the house. There is a chapel with three art windows with original designs. A balcony opens from the chapel into the hall giving a very fine effect.

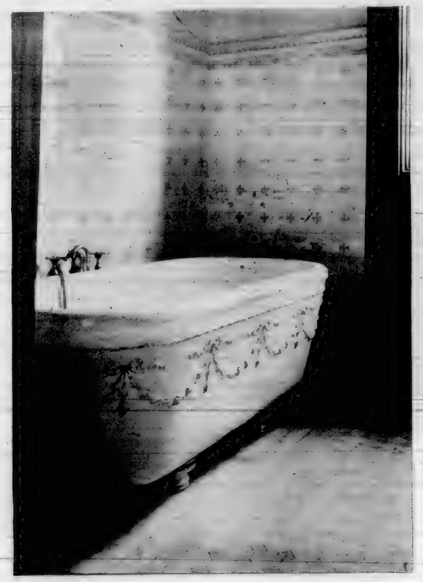
The parlors are finished with moulded cornices and the windows have Ionic pilasters and entablatures. One of the parlors has a most beautiful mantel made of California Onyx by Kesseler Bros., and the other a fine Oak mantle.

ONYX MANTLE MADE BY KESSELER BROS.

The dining-room is one of the most elaborate ever built in this city; it is highly ornamented with wainscoting composed of engraved panels separated with Ionic pilasters. The ceiling has the beams exposed and are ornamented with rosettes and fluted. The crossing of the beams form forty squares three feet on each side, they have all fine centers; the ends of all the beams are supported by mural brackets with moulded cornices between them. All the walls were handsomely decorated by D. O. Sturts the artist, and highly ornamented in white and gold Louis XVI. style by the well-known firm of St. Dennis, painters who did all the painting for the house. All the metal work in this room is gold plated.

Mrs. Wohler, the owner, has adjoining her room a bou-

doir and a very pretty bath-room for her exclusive use. The latter has one of the finest porcelain tubs manufactured exclusively for this work by the J. L. Mott Iron Works, to



MADE AND DECORATED ESPECIALLY FOR THIS BUILDING BY THE J. L. MOTT IRON WORKS AND SET BY MR. W. D. HOBRO.

match the glazed tiling that covers the walls. The water closet, bath tub and wash stand have marble safes, the balance of the room is covered with encaustic tiles; all the metal work in this room is silver-plated.

The contract for the whole building was let to Mr. A. C. Hussey, and to his management in letting out the work to good and responsible sub-contractors and attending personally to the works is owing in a great measure the success of the whole building. The result shows that he was entirely in sympathy with the architect's ideas and carried them out carefully and conscientiously.

Dunham, Carrigan & Hayden Co., had all the hardware specially made by the Yale Lock Co. for this building of the higher class and modern designs.

The firm of Richardson & Gale furnished the granite and material for the brick work which they executed in a superior way. The shafts for the chimneys were specially designed with fluted columns and terra cotta capitals. Their execution was quite difficult but was done in a very satisfactory manner by the above mentioned contractors.

The plumbing in the house was specially designed by the architect to have every sanitary improvement and precaution against sewaga gas, Mr. W. D. Hobro, the well-known plumber carried out the work in a perfect manner.

Every convenience for lighting the gas and bell service was furnished by Paul Seiler the well-known furnisher of electrical supplies.

Great care has been taken to have the gas fixtures to harmonize with the finish of the rooms where they were intended, the extensive stock of Thomas Day Co., made it possible to obtain the many different styles required, and others were promptly manufactured by the same firm.

To insure absolute protection against dampness, heat, cold or dust, all the walls of the building are sheathed with P. & B. Building Paper, a California production manufactured by the Paraffine Paint Co., 116 Battery street. This paper is now used in all first-class houses and is specified by all the leading architects as a most perfect insulator.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.
SETH BABSON, Pres. W. P. MOORE, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
OCTAVIUS MORGAN, PRES. A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec't. AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
GEO. W. DICKIE, Pres. W. G. CURTIS, Vice-Pres.
OTTO VON GELDERN, Sec. EDWARD T. SCHILD, Treas.

MASTER PLUMBERS' ASSOCIATION, meets every first and third Friday of each month at the Flood Building.
JAS. E. BRITT, Pres. J. L. E. Firman, Sec.

BUILDERS' EXCHANGE, Directors meet first Friday in each month at Mission and New Montgomery.
OSCAR LEWIS, Pres. JAS. A. WILSON, Sec.

MASONS' AND BUILDERS' ASSOCIATION, meet first Friday evening of each month.
CARL WORRELL, Pres. VICTOR HOFFMAN, Sec.

THE ANNUAL MEETING OF THE BUILDERS' EXCHANGE.

THE Annual Meeting of the Builders' Exchange and the election of directors to serve the ensuing year was held at the Exchange Hall, Mission and New Montgomery streets, on Wednesday, March 25, 1896.

President Oscar Lewis occupied the chair.

Proposed amendments to the By-laws were not acted upon but postponed for two weeks when a special meeting will be called for this purpose.

The president's annual address reviewed the work done by the Exchange for the past year and showed a very flattering increase in the treasury and the membership; there being about 317 members, an increase of 41 and a total in the treasury of about $7,000.

The most interesting proceedings was the election. Sixteen candidates were in the field and the interest taken by many of them for the honors of office and the uniform and deep interest manifested by the general membership, spoke volumes for the future prosperity and extension of Exchange influence and honorable business methods.

The Exchange being composed of all branches in the building business, the various trades supported their particular representative as a rule with the result that the incoming board is a splendid index to the general membership, there being:

M. C. Lynch, Thos. McLachlan, Thos. Elam and C. P. Moore, carpenters; Jas. A. Wilson, Thos. W. Butcher and M. McGowan, bricklayers; J. J. Morehouse, plasterer; Jas. E. Britt, plumber; Gus. V. Daniels, painter; Oscar Lewis, foundryman.

BUSINESS MOSAICS.

The Hunter.—The Hunter Arms Co., Fulton, N. Y., makers of the celebrated L. C. Smith gun, are now manufacturing the Hunter bicycle. The L. C. Smith gun is acknowledged to be the foremost trap-gun in the world, and is used by all prominent shooters. At recent tournaments, Smiths' guns won over ninety per cent of the prizes. The winning team of the Olympic Club and others shoot Smiths. Hunter cycles are made like L. C. Smith guns, first-class in every respect, made by practical mechanics with a reputation for fine work. Gun barrel brazing is the most difficult tube brazing in the world; barrels must be true to a thousandth part of an inch. Hunter cycles are brazed and lined up that way. The Hunter has crown steel, gun barrel tubing, fully reinforced, drop forged steel bearings and cones, extra heavy, with a gun-barrel finish. (There is not a piece of cast iron or steel in this wheel.) Extra large barrel hubs and balls, extra quality spokes, narrow tread, reinforced forks, back and front, easy adjustment of bearings and chain, double truss crown, the strongest ever put on a wheel, visible bearings, locomotive oil cups. The Hunter patent detachable cranks can be taken off in ten seconds. Adjustable handle bar, Brooks, Sager and Hunter saddles, M. & W. or Vimtires, and other improvements. We only ask for a comparison with any bicycle on the market. Critical inspection is invited at either of the city agencies, Clabrough, Golcher & Co., 605 Market street, or E. T. Allen Co., 416 Market street. Pacific Coast agency, Phil. B. Bekeart, 159 New Montgomery street, near Howard.

"Henry," said Mrs. Peck, "I am going to get a bicycle." "Dear me," said Mr. Peck, mildly, "isn't one man enough for you to run over?"—*News Letter.*

When the porcelain iron goods were first introduced to the trade it was regarded as a step in advance, and a great inprovement in the way of sanitary appliances. Since the introduction of the Imperial porcelain ware with its substantial thickness, fine glaze and beautiful appearance, accompanied with a great reduction in prices bringing this article within the reach of anyone heretofore using the porcelain iron goods. A more general demand for this class of goods is springing up.

The J. L. Mott Iron Works are prepared to supply this demand and those who are debating what kind of goods to order for the new house would do well to consult Mr. M. S. James, the Pacific Coast Representative of the above named work. Room 27 Flood Building, San Francisco.

"I am sorry that I have broken your vase. Was it valuable?" "It was old Sevres." "O! I was afraid it was new."—*News Letter.*

The Pancoast Ventilator.—In calling attention to the merits of this ventilator, we are centainly justified in mentioning some of the claims made by the manufacturers, which claims have been fully warrented as vouched for by members, who have used the Pancoast Ventilator. It is guaranteed to exhaust more cubic feet of air per minute than any other storm-proof ventilator made. It is absolutely storm and cinder proof. N. & G. Taylor Co., Manufacturers Agents, Philadelphia.

"How did that criminal evade the detective so long?" "Why, he rented a room in the same flat with him."—*Chicago Record.*

Now is the time, as summer is approaching, to prevent your house becoming a refuge for the annoying fly—Messrs. Edward B. Hindes & Co., 411 Mission street, will furnish you with Hills' Patent Inside Sliding Blinds, as well as Perfection Window Screens. Then you are safe—A word to the wise is enough.

Visitor—Do you think the baby resembles his pa? MOTHER—Oh, yes; he keeps me up late every night.—*News Letter.*

It should be remembered by those who wish to protect their buildings from fire that the use of the Schenck Swinging Hose Reel will reduce your insurance and give you a feeling of security from fire that will make you happy and increase your appetite.

Lady Patient—Doctor, what do you do when you burn your mouth with hot coffee? DOCTOR—Swear.—*News Letter.*

Stevens' Patent Chimney will be found at NE. cor. of Larkin and Market; remember this chimney is approved by the Fire Wardens and endorsed by Architects and Builders. At the same place will be found a good assortment of terra cotta pipe, chimney tops and flour pots, F. M. Stevens, proprietor.

"Don't you think my hat a dream?" "Yes. What did you eat the night before?"—*Detroit Tribune.*

CITY BUILDING NEWS.

Andover and Cresent Ave. Cottage; owner, John Mueller; architect, G. H. Batchelder; contractor, J. W. Fish; signed, Feb. 19; filed, Feb. 20; cost $1250.

Army near Guerrero. Church; owner, Trustee St. Johns G. M. E. Church; H. Schrader, H. Marks; contractor, Chas. Koenig; signed, Feb. 20; filed, Feb. 24; cost $2500.

Baker and McAllister. To build; owner, Robert Wannenmacher, architect, Emil John; contractor, J. Bucher; signed, Feb. 25; filed, March 7; cost $7872. Plumbing and gas-fitting, contractor, Henry Hufschmidt; signed, Feb. 28; filed, March 7; cost $1150.

Bay near Mason. Two-story frame; owner, Henry Pansman; architects, Martens & Coffey; contractor, H. Trost; signed, Feb. 27; filed, Feb. 27; cost $3700.

Belvedere near Frederick. Three-story frame and cottage, except plumbing, owner, Mrs. Nellie L. Knight; architect, Maxwell G. Bugbee; contractor, H. M. Macheson, C. B. Franklin; signed, Feb. 6; filed, Feb. 8; cost $5000

Belvedere near Frederick. To build; owners, Jacob and Peter Schaefer; architect, owner; contractor, W. W. Rednall; signed, Feb. 8; filed, Feb. 10; cost $3690.

Belvedere near Federick. Two-story frame; owner, William Hinkel; architect, Herman & Swain; contractor, Petterson & Pearson; signed, March 5; filed, March 6; cost $3250.

Brannan near 5th. Frame building and stable; owner, Somers & Co.; contractor, W. P. Smith; cost $2000.

Bush near Devisadero. Repairs to partially burnt building; cost $1500.

California near 12th Ave. To build; owner, J. B. Bettelluch and wife; architects, Martens & Coffey; contractors, Weinsehl & Franz; signed, Feb. 15; filed, Feb. 18; cost $2092.

California near Larkin. To build; owner, Henry McDonald; contractor, Wm. Helbing; signed, Feb. 21; filed, Feb. 21; cost $6600.

California near 6th Ave. To build; owner, M. J. Savage; cost $5500.

California and Polk. Frame Bldg; owner, W. B. Bradbury; architect, F. B. Wood; cost $15,000.

Cole near Waller. Four frame residences; owner and builder, William Hinkel; cost $18,500.

Clement near 2d Ave. To build; owner, Mrs. Robertson; contractor, D. Einstein; cost $2500.

Clipper near Dolores. Cottage; owner, Barolin Schachlmber; architect, C. M. Rosseau; contractor, Geo. E. Nall; signed, March 9; filed, March 9; cost $900.

Davis near California. Excavations and pile driving; owner, Mrs. Ellen Folger; architects, Percy & Hamilton; contractor, S. F. Bridge Co; signed, Feb. 19; filed, Feb. 25; cost $7500.

Devisadero near Post. Alterations and additions; owner, Adolph Meyer; architect, Emil John; contractor, Carl Greise; signed, March 6; filed, March 9; cost $1460.

Diamond near 19th. One-story frame; owner, Otto Luhn; architect, Emil John contractor, T. C. Cochrane; signed, March 2; filed, March 7; cost $1800.

Eight Ave. near California. Additions to a two-story frame; owner and builder, W. Keeney; cost $1500.

East bet. Howard and Folsom. Two-story frame; owners, Scott & McCord; contractor, R. Currie; cost $4500.

Fell near Ashbury. Plumbing, gas-fitting, etc., for flats; owner, J. H. Brumings; architects, Martens & Coffey; contractor, G. C. Sweeney; cost $775.

Fell near Ashbury. Plumbing, gas-fitting, etc.; owner, Henry Bohls; architect, Martens & Coffey; contractor, G. C. Sweeney; cost $775.

Fourth near Bluxome. Excavations, concrete, brick, etc.; owner, Peter A. Smith; architect, Emil John; contractor, J. H. Hanuvan; signed, Feb. 27; filed, March 7; cost $8000. Carpentry tubing, etc.; contractor, C. Krecker; cost $2571.

Fifth Ave. near Pt. Lobos. Cottage; owner and builder, W. A. Lee; cost $1500.

Fifteenth near Mission. Alterations and additions; owner, Elizabeth Pomeroy, architect, M. P. Schetzel; contractor, T. McLachlan; signed, Feb. 27; filed; Feb. 28; cost $2475.

Geary near Hyde. To build; owner, Fredinand Bazan; architect, E. Depierre; contractor, R. O. Davis; signed, Feb. 29; filed, Feb. 29; cost $3120.

Haight and Devisadero. Alteration and addition; owner, Hohn Bros.; architect, C. F. Robertson; contractors, Otten & Lorensen; signed, Feb. 18; filed, Feb. 19; cost $3265.

Haight near Broderick. Two-story frame; owner, J. C. Malon; architects, Shea & Shea; contractor, Jas. J. O'Brien; signed, Feb. 17; filed, Feb. 24; cost $6300.

Haight near Masonic Ave. Two-story frame; owner, Elia Dutell; architect, Oliver Everett; contractor, Paul E. Struck, signed, March 9; filed, March 9; cost $2125.

Hyde near Ellis. All work except painting and plumbing; owner, Therese Muller; architect, De Prosse & Meinsdorffer; contractor, Isaac Penny; signed, Feb. 17; filed, Feb. 17; cost $3355. Painting, etc.; contractor, Becker Bros.; signed, Feb. 17; filed, Feb. 17; cost $520.

Jackson near Mason. Alteration and addition; owner, James M. A. Casto; architect, C. M. Rosseau; contractor, L. M. Weismann, C. Bartels; signed, Feb. 14; filed, Feb. 18; cost $3219.

Kentucky and Napa. Two-story frame; owner, D. E. L. Wemple; architect, Hugo W. Storch; contractor, M. & H. Peterson; signed, Feb. 20; filed, Feb. 20; cost $1975.

Lafayette Square near Gough. Grading; owner, City of San Francisco; contractor, John Tuttle; cost $17,500.

Lafayette Place near Green. To build; owner, Giambatista Pezzolo; contractor, G. Banchero; signed, March 23; filed, March 23; cost $3000.

Market near 5th. Fixtures and counters for coat department; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, L. & E. Emanuel; signed, Feb. 5; filed, Feb. 15; cost $3675.

Market near 5th. Fixtures for drug store; contractor, San Francisco Furniture Co.; signed, Jan. 28; filed, Jan. 28; cost $3885.

Market near 5th. Illuminating tiles for side walk; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, P. H. Jackson & Co.; cost $5500.

Market near 5th. Fixtures for artists department; owner, Mrs. A. L. Parrott; architects, Pissis & Moore; contractor, San Francisco Furniture Co.; signed, March 5; filed, March 5; cost $9772. Fixtures and tables for crockery department, cost $5362.85.

Market and 1st. Additions and alterations to brick building; owner, Mark Sheldon; architect, Clinton Day; contractor, W. Grant; signed, Feb. 12; filed, Feb. 15; cost $10,454.

Market street, No. 902. Alterations; owner, J. Farley; architects, Havens & Toepke; contractor, F. W. Kreling Sons Co; signed, Feb. 24; filed, Feb. 24; cost $3696.

Noe and 15th. Two three-story frame; owner and builder, T. Nelson; cost $8000.

Nineteenth near Clement. Cottage; owner, D. J. Heany; cost $1500.

Page and Lyon. To build; owner, C. Van Tssendof; architect, E. J. Vogel; contractor, Fred. B. Butterfield; cost $1806.

Pacific street Wharf Sheds. Owner, Board of Harbor Commissioners; contractor Healy, Tibbitts & Co.; cost $7893.

Point Lobos Ave. and Ferrey. Alterations; owner, Chas. R. Hanthorne; contractor, A. L. Jacobsen; cost $1000.

Post near Stockton. Six-story frame foundations for; owner, Hobart Estate Co.; architects, Percy & Hamilton; contractors, Keatinge, Leonard & Ransome; cost $3746.

Post near Stockton. Mill work, glass, hardware, painting, etc.; owner, Hobart estate; architect, Percy & Hamilton; contractor, T. S. Day & Sons; cost $7600... Structural and cast iron work; contractor, Judson Mfg. Co.; cost $9940. Tin work, skylights, copper roof, painting, etc.; contractor, Forderer Cornice Co.; signed, March 2; filed, March 4; cost $1824. Brickwork and cementing; contractors, Richardson & Gale; cost $9463.

Sansome and Chestnut. Office and sheds; owner, Bellingham Bay Impt Co.; cost $2500.

Sharron near 16th. To build; owner, John McCabe; contractor, T. R. Bassett; cost $2000.

Shrader near Waller. To build; owner and builder, William Hinkel; cost $4250.

Sierra near Tennessee. To build; owner, James Nugent and wife; contractor, John Keneally; signed, March 2; filed, March 9; cost $2139.

Stewart near Mission. Four-story brick; owner, E. R. Lilenthal; architect, Clinton Day; contractors, Riley & Loane; cost $10,856.

Sixteenth and Sanchez. To build; owner, C. E. Gisin; owner and builder; L. B. Schmid; cost $1850.

Stockton near Filbert. Alteration and additions; owner, G. B. Torasso and L. Centenaro; contractor, W. J. Weiss; cost $1850.

Thirteenth Ave. Clement. To build; owner and contractor, H. P. Fish, architect, Frank Charming; cost $2500.

Twenty-second Ave. near Clement. Cottage; owner, Chas. H. Lane; cost $2000.

Twenty-third Ave. near Clement. Six cottages; owner, Samuel Holden; cost $9000.

Twenty-third near Harrison. To build; owner, D. Keefe; architect, M. J. Welsh; contractor, D. Currie; signed, March 2; filed, March 3; cost $3800.

Twenty-ninth near Dolores. To build; owner, Claus Linderman; contractor, W. C. Hamerton; cost $3550.

Twenty-ninth near Npe. To build; owner, R. Trost; cost $2700.

Turk near Leavenworth. Additions; owner, J. C. Nealon; architects, Shea & Shea; cost $3000.

Union near Hyde. To build; owner, James & Johanna Costello; contractors Westerlund & Landeen; cost $1173.

Valencia near 21st. Alterations; owner, Henry Hoffman; architect, John McHenry; contractor, James E. Mooney; cost $2895.

Van Ness Ave. and Jackson. Illuminating, skylights, etc.; owner, Claus Spreckles; architects, Reid Bros.; contractor, P. H. Jackson & Co.; cost $1575.

Vallejo near Gough. To build; owners, Lillian R. Lilienthal, R. L. Lilienthal, Carrie Van Vorst and S. T. Bernhard; contractor, Isaac Anderson; cost $6350.

Walnut near Clay. To build; owner, C. Righetl; architect, E. Depierre; contractor, G. A. Magel; signed, Feb. 25; filed, Feb. 26; cost $4524.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

N another column will be found a letter from a bricklayer who is an old resident of this city where he has been in business many years, in which he brings to our attention the very practical manner in which he is carrying out an excellent idea. He is teaching a class of boys, the sons of men engaged in the building business, not only the methods of laying bricks, but how to express their ideas of form and design on the drawing board in such a manner as to be understood by other intelligent mechanics; and doing it too without interfering with the regular course of studies in the public schools.

This is putting in practice the theory that the development of the body should keep pace with the improvement of the mind, and the early manual training of the youth should meet with the approval of all thinking people; for unless practical application is made by the student of all the knowledge he acquires, the knowledge is of no practical use and of little benefit to himself or society.

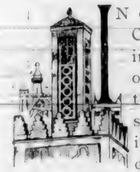
The apprentice system as practiced by the various trades unions, whereby the number of apprentices is regulated by the number of journeymen, is a means of defence whereby they hope to increase the amount of wages by limiting the number of skillful mechanics. This has a tendency to lessen the chances of the unemployed non-union man, by making it more difficult to secure employment or instruction, and while it may be the only available weapon that the unions can employ, it is not a just or logical one. The better way would be to remodel society on a basis that would secure employment to all, and here comes in larger and graver issues than the training of mechanics.

After having received a liberal education and fitted himself for an active and useful position in life, what is the chance of finding the necessary opportunity to apply his knowledge to useful ends? This brings us at once into the much discussed and never settled question of political economy, and it seems that common sense must be left behind and entirely ignored when dealing with this question. At least common sense has always been ignored, and when an attempt is made to adopt sensible methods we are met with the assertion that it is not practicable. For instance statistics show that there are about two millions of idle unemployed men in the United States vainly seeking work, and that in the neighborhood of two million of children of school age are herded in factories toiling at tasks that should be done by adults. This is the result of so-called civilization and our much lauded competitive system, but let us

ask is it right or is it common sense? Common sense would say that the children should be at school, and the idle men at their work.

Another instance: A machine is invented by which one man does the work it took ten men to accomplish before. Common sense would say that it must be of great benefit, because it would allow each man to enjoy nine-tenths of leasure time and still achieve the same results as before. But not so; political economy turns nine men adrift and works the tenth man just as hard as ever.

It seems to us to be a burning shame that a nation that calls itself Christian can find no just and equitable solution to questions that admit of but one logical solution. Is it any wonder that an increasing number of people in all countries are turning from the present school that admits its importance to that of the Socialists who at least claim that they have a remedy. The position of humanity at the present time is very like that of the sick man in the fable: His case was diagnosised by two physicians; one pronounced his case hopeless, and the other said he could be cured. He engaged the former and he next day was dead. "Now you see," said his doctor "that I was right, for the patient died!" "Yes," said his confrere, "but if he had chosen me, he would be well to-day!"



IN our two latest Competitions, the Affiliated College Buildings and the new City Criminal Building, there was no proper amount of time given to the architects to prepare their plans—consequently in both cases no satisfactory result has been obtained, and in the first case, in consequence of the bad conditions of the Competition there were but five competitors and most of those inexperienced in large public buildings. The impossibility of properly considering such a varied question as provides homes for five different, although Affiliated Colleges is evident when we see the very ill considered plans and designs for them. It would be very much better for the State in the first case and the city in the other to lay over the whole matters until proper time and consideration is given to such subjects—for when they are once settled they are irredeemiably settled for many years.

Possibly a new Legislature may by appropriate laws prevent the necessity of new Jail Room and the number of Criminal Courts by which we are now burdened; should that be so the money appropriated for these purposes can with more pleasure be devoted to more remunerative enterprises, for it must be remembered that it is not only the first cost of new jails but the cost of maintaining them thereafter that forms the burden on the tax-payers.

WE publish in another column some interesting information given a *Call* reporter and some remarks by Senator Perkins of California, criticising the way in which the United States government conducts an architect's office. We think the Senator is wrong in blaming the supervising architect for the unsatisfactory condition of affairs. He says "the truth is that the supervising architect is not a big enough man for his place." We think the truth is that the supervising architect is a political underling of an autocratic superior, and as such is obliged to take his orders from head quarters, and when he is ordered to delay the progress of the work of his office, he is obliged to obey those orders.

The American Institute of Architects has for many years past, made a gallant fight to inaugurate a better system, and nothing daunted by repeated failures, is again in the field this year. If the public would only understand and appreciate and support the fight the architects are now making single-handed, there would be much more chance of achieving success and then the people of San Francisco may begin to hope for a new and suitable Post-Office building, but not till political methods are supplanted by business methods is there much prospect of the building authorized by Congress in 1887 (nine years ago on the coming third of March) ever being erected.

AN OLD POST-OFFICE BUILDING.

THE acting supervising architect of the treasury department said to the *Call* correspondent in Washington:

"We are now waiting to hear from Postmaster McCoppin. You understand that these buildings are taken up in their regular order, and San Francisco has now been reached, but we cannot go on with our plans until the Federal officers have agreed as to arrangement of their several and respective rooms."

Another official of the supervising architect's office, who, however, does not wish to be quoted, said to the *Call* correspondent that unless the Federal officers speedily agreed on the interior arrangement of the building the architect would take the matter in his own hands and go ahead with the plans. He said that one of the United States Judges had been very much dissatisfied with the designs of the building, and had intimated to the department that unless the plans were changed he would object to moving into it. He did not say who this official was, but it is surmised that it was either Judge McKenna or Judge Morrow. It was furthered ascertained that the supervising architect would modify the plans and general design of the building. The design, as prepared by the former architect of the treasury, O'Rourke, was the style of Italian renaissance. The modified plans will be after the style of Spanish renaissance, and the appearance of the building will be greatly changed and improved. Indeed, the change will be so radical that the appearance of the building will be altogether different.

An officer of the supervising architect's office said to a *Call* correspondent: "Of course we cannot decide on the design until we know how much space each one of the Federal offices will need, and until Postmaster McCoppin sends on his own ideas we cannot go ahead with the plans. But in general, it will be enough to say that the general appearance of the building will be greatly improved and beautified."

The *Call* correspondent asked the reason for changing the design of the building, and was told that the former plans been prepared by Supervising Architect O'Rourke, but that the present architect, Aikin, was not altogether satisfied with them, and had directed draughtsmen of the office to prepare other designs. The correspondent inquired when the people of San Francisco might reasonably expect the work of construction to begin, and was told that it all depended on the Federal officers, but as soon as Postmaster McCoppin responded to the request of the architect's office, and it was found that the ideas of the several Federal officers might be amalgamated, the draughtsmen of the office would immediately begin to draw new sketch plans.

"Then, when in your opinion will real construction of the building commence?" asked the correspondent.

The acting supervising architect replied:

"That would be impossible to say. It might be only a month or so, and it might be a year, but you may say to your people that the San Francisco building has been reached in regular order and work will be rushed as rapidly as possible. These buildings are taken up in the order in which appropriations were made by Congress, and heretofore it has been impossible for us to do anything with the San Francisco building for the reason that there were other buildings ahead of it, and for the further reason that there has been a delay in hearing from Federal officers in California."

This was all the satisfaction that could be obtained from the architect.

Senator Perkins said to the *Call* correspondent:

"The way the supervising architect has acted in this matter has been very aggravating. Several months ago Judge McKenna wrote me, giving his ideas as to arrangements of courtrooms, judges' chambers, clerks' and marshals' rooms, etc.

"He was anxious to have the courtrooms located at the several corners of the building, so as to secure as much light as possible, and also suggested that for the sake of convenience the clerks' and marshals' offices and other rooms connected with the court all be situated on the same floor. I went to see the supervising architect and had a short interview with him. He expressed regret that the work on the building had been delayed, but said that the office was swamped with work and he was doing his best with the force he had and that there would be many buildings to claim his attention. Time went on, and finally I wrote him, suggesting that if he would send me an estimate of the amount required for additional draftsmen I would introduce a bill in the Senate to appropriate money for that purpose, as was done in the case of Chicago's post-office, when Congress made a special appropriation to secure draftsmen for that building. I was somewhat surprised at receiving no answer to my letter, for I had naturally supposed that the supervising architect would be willing and anxious to have assistance furnished him.

"I wrote him again, but received no satisfaction. Then I sent a special messenger conveying an intimation that I could not understand his reason for not replying to my communications. I instructed my messenger to secure some kind of answer. The architect promised to furnish me the data I had requested, but I never received them.

"It was very discourteous treatment, to say the least, and I gave him to understand that unless I received some information from him I would introduce a resolution in the Senate demanding to know from the Secretary of the Treasury the reason for delay in commencing work on the building, and directing him to proceed with the construction. The supervising architect then sent his secretary to see me. I was not in my hotel, but he left his card. I afterward received notice from the department that if the Public Buildings and Grounds Committee would request information on the subject it would be furnished to Congress. The resolution was then passed, and in response the Secretary of the Treasury sent a letter which merely recited the fact that an appropriation for the building had been made, the site purchased and the limit of cost of the building fixed at $2,500,000, but that a proviso had been made that no work was to be done until the commission of Government engineers had examined the foundation and reported it to be firm; that sketch plans had been drawn, and the working plans were being prepared and would be completed as soon as possible.

"This was the last I heard of the matter, and altogether it has been very unsatisfactory. There is some reason for this delay which I cannot understand. The supervising architect may be swamped with business, but I offered to make an earnest endeavor to provide assistance for him. The truth is the supervising architect is not a big enough man for his place. He devotes too much attention to details of his office, instead of intrusting it to assistants. I am very much vexed on account of the delay and feel that I have been treated very discourteously by the architect. I am considering the advisability of introducing my resolution on Monday, demanding explicit information from the Treasury Department why work is delayed and directing the Secretary to proceed with the construction immediately."

Representative Maguire said: "I have no knowledge of the status of the post-office building plans, but will say that I think the delay is unwarranted. Four weeks ago I was told at the department that plans would be proceeded with when certain information had been received from Federal officers at San Francisco as to the interior arrangements, but since then I have heard nothing."

Representative Loud said: "The department may make excuse after excuse. My own opinion is that they are delaying work on this building and others because they have not the money to spare out of Uncle Sam's cashbox, but don't want to admit the fact."

ARCHITECTURE AND ENGINEERING UNDER THE PROPOSED NEW CHARTER FOR SAN FRANCISCO.

BY W. J. CUTHBERTSON.

UNTIL such time as municipalities assume control of the production and distribution of necessities for their citizens, the chief business—outside of the collection of monies and the protection of life and property—in which they engage is Architectural and Engineering works.

The Board of Freeholders which made up, what must be called for distinction, the Freeholders' Charter, to be acted on by the people next election, was composed of:—1 Dealer in Bonds; 1 Dealer in Stocks; 1 Dealer in Real Estate; 1 Dealer in Dry Goods; 1 Iron Ship Builder; 1 Commission Merchant; 1 Banker; 1 Stevedore; 2 Lawyers; 1 Doctor; 1 Lithographer; 1 Insurance Agent. On this board there was not one who knew anything practically about these two chief branches of the City's Business; and therefore we cannot expect laws governing the conduct of this business devised by men of such experience to be anywhere near perfect. The result shows the correctness of the reasoning.

The great majority of the Board, being as indicated before from the class of traders, we find a large portion of the Charter given over to Laws regulating the trading side of the city management, and providing checks against dishon-

esty and other tricks of trade that might be practised by the City Officials and those having dealings with the City.

An erroneous idea of the nature of a Charter seemed to prevail among the Board. A City Charter is really simply an act of incorporation and answers to the articles of incorporation of a stock company, and should be concerned only with fundamental law. But unfortunately the members of the board have gone into column after column of details of the management of each department—in fact has made complete By-Laws. By this means they have got themselves at sea. All the minute details of finance they are at home in and no doubt their regulations governing that department are good; but when they commence to regulate the Department of Building and Engineering they flounder.

All those experienced in letting out work by contract to the lowest bidder know the evils of that system and the abuses to which it leads, and know that all the regulations and penalties, forfeitures, etc., which the Board has devised to keep the contract system pure are perfectly useless. Yet the Board has such faith in this Contract system that they actually say that all work *shall* be done by contract.

When an owner of property wishes his home built well or his sewerage perfect he doesn't let it out to the lowest bidder, but has it done by day's work under proper supervision. So must all city work be done. When the Merchants want the streets kept clean they don't let the work by contract but employ men by the day. It is a good proverb "set a thief to catch a thief". So to watch a thieving Contractor properly you must have a thieving City Architect and a thieving City Engineer—and finally a thieving Board of Public Works and possibly a thieving Mayor and then what becomes of all those carefully prepared safe guards thrown around then.

It is most surprising that the Board should provide that the Board of Public Works shall be appointed by the Mayor, after the example that the neighboring city of Oakland has offered of the results of such a method. This method of appointing the Board of Public Works led to such abuses in that city that the people arose in their might and an amendment to their Charter was carried abolishing such a method and making the Board of Public Works elected by the people—and it must be said that the result so far has been far preferable to the old regime, though of course anything but perfect. Yet in the face of all this the Board of Freeholders ask the citizens to vote in favor of having such a thing in San Francisco, we presume so that it may fit in with their dominant idea of the centralization of power.

Architecture and Engineering have been recognized for some time as two separate branches of constructive work, and there should be a separate department for each; the first having charge of the buildings and parks, a class of work wherein æsthetics are apparent; while engineering should have charge of public utilities in the shape of streets, sewers, water supply and such like works commonly called engineering works. They should therefore be under control of separate boards—and the heads of these departments as well as all the other departments of the city business should not be appointed by one man but by a popular body of at least twenty-four members, which should be thoroughly representative of the different classes of the community, a result obtained by proportional representation.

There have been benevolent despots no doubt in the worlds' history, who have endeavored to work for the public good, but we cannot afford to hand over our liberties on the chance of getting a benevolent despot to rule us, which would be the case were this Charter adopted.

We need only to point to the present disastrous and almost unbearable state of affairs throughout the country to show the perfect inability of centralized despotism as exemplified in the presidential office of the United States to cope with economical troubles or even to build us a Post-Office.

No reflections are intended in this article to be cast upon the Board of Freeholders who really had not sufficient time to properly consider the business. It is not, against little matters of detail, which can be rectified afterwards, but against the vicious principles which underlie the proposed Charter and which when once endorsed by the people, will direct their character in a wrong direction, that these few remarks are directed.

FIRE-ESCAPES.

THE heart-rending scenes enacted at the recent fire in one of the Troy Collar and Cuff Factories draw attention again to the inadequateness of the upright Fire Escapes for escape from fire where numbers of females are located on the floors of any building. The Burdett Building where the event happened had two vertical fire ladders but it seems they were almost useless for purposes of escape. For all buildings of this description the sloping ladders with handrails ought to be used and all sentimental ideas in regard to destroying the architecture of the facade must be downed—if architects cannot design outside staircases architecturally all the worse for them. It can be done however. Another very necessary regulation which ought to be adopted in view of these horrors, is the adoption of the bloomer costume as a work dress for girls and women. No doubt all could have been saved in this case had it not been for the skirts which hampered their movements.

Another matter which must be at once attended to by municipalities is the abolition of all overhead wires, the way these hampered the working of the firemen on this occasion is ably set forth by E. C. Chamberlain a correspondent of *Fire and Water:*

"As *Fire and Water* is the one paper of its class that is universally read all over this continent, I may be permitted through its columns, to say to other cities (any one of which may have to pass through our recent terrible experience) that they should take warning therefrom and assist upon the overhead wires being placed underground, and insist further upon having affixed to all buildings—where the law commands that there shall be fire escapes—escapes having balconies running across horizontally, as all others are worthless and of no use. Let all cities likewise provide fire apparatus proportionate to the size of their city, and, above all, let them have a good water supply. It is necessary; it is vital; it is the keynote to successfully fighting every fire. In Troy we have never yet been crippled in that way.

"I will say in conclusion. Let us unite in compelling every city in the United States to put its wires under ground. It is not a local, but a national issue, and should be treated as such.

"If one person kills another, we kill him; and the man who strings wires in front of tall buildings which are crowded with workpeople is as much guilty of murder as he who sets a trap for your life. Indeed, what worse or more cunningly contrived death-trap is there than the overhead wires?

"The fire escapes are misnomers, and proved themselves in reality useless for the purpose they were supposed to serve. They may possibly do for men; for girls and women they are simply no good, as their skirts stand in the way of anything like making the descent expeditiously and safely. The overhead wires which form a pendent mass now lie prone on the earth amid the pile of poles and crosstrees, extending right, left, and centre, were so arranged as to form not merely an obstacle to the firemen, but an absolute preventive to their being able to do their work effectually, especially to their being able to save the lives of those who were dependent upon their exertions for preservation from one of the most awful forms of death. In this particular instance the wires along the streets were a menace to the firemen. It was, it always is an impossibility for a fireman to cut down a network of 100 or more wires, as it is never known how many of these wires are 'alive.'"

BOOKS AND PERIODICALS.

APPENDIX U.

PROFESSOR WING'S, FULL-SIZE TRANSVERSE TESTS OF DOUGLASS FIR.

"Professor Chas. B. Wing, Leland Stanford University, California, published in *Engineering News* of March 14, 1895, an account of the methods used and results obtained by him in a series of full-size transverse tests of Douglass fir. None of the specimens were selected for testing. The timber was ordered from a San Francisco lumber yard, and would probably rate as a poor lot of "No. 1 Merchantable." The sticks contained considerable sap. Some of the sticks failed by shearing along the fibre parallel to the length of the specimen. Professor Wing states that it was noted that knots, even when sound and tight, weakened the stick by decreasing the section, and by causing the fibre to be cross-grained and curly, easily crushing when in compression.

The ultimate breaking extreme fibre stress in pounds per square inch obtained from ten sticks, each 6 in. x 10 in. x 17 feet long, was 4,590 to 7,951, average 6,293. The stick giving the limit of 4,590 was a stick that would have been culled in an ordinary lumber inspection. Excluding this stick the results ran from 5,580 to 7,951, average 6,482.

An additional series of ten tests was made with pieces 3 in. x 5 in. x 4 ft. 3 in. long, cut from uninjured parts of the large sticks that had been previously broken. The results showed ultimate breaking extreme fibre stress in pounds per square inch, from 6,438 to 12,056, average 9,257. The stick giving the lowest limit had a knot through the center. Excluding this the lowest limit was 7,960.

HOME STUDY, an elementary monthly journal for students of the Industrial Sciences and readers of the technical press who need a better knowledge of Arithmetic, Geometry, Trigonometry and the principles of Physics and Drawing to enable them to derive the best results from their reading is a very useful magazine for those who are out of the way of Technical Schools or colleges. Published by The Colliery Engineer Company.

THE PENNY MAGAZINE, published monthly by the Penny Magazine Company, Bourse Building, Philadelphia. Subscription price twenty-five cents a year postage prepaid.

Here we have a nicely printed Magazine, on good paper and full of good things, no continued stories, for the trifling sum of twenty-five cents per year. Some Pecksniff who never reads, may exclaim "this is equally objectional" as the twenty-five cents per copy would be, but those who study economy and are fond of good reading will be glad to avail themselves of such an opportunity.

ADDRESS TO THE BOSTON PUBLIC SCHOOLS by George T. Angell. This interesting phamphlet should be read by every child upon the Pacific Coast—we only wish Mr. Angell could be induced to repeat the address before the school children of San Francisco. If this is not possible a copy should be placed in the hand of every child and every teacher of children in the state. This could be accomplished at a comparatively little cost, as the Humane Education Society furnish their publication at a very low rate, besides an immense number distributed free of cost.

Will not the Board of Education look into this and do something towards placing a copy of this address in the hand of every child that attends our public schools.

We are indebted to the State Board of Health of Rhode Island for A REPORT OF THE RESULTS OBTAINED WITH EXPERIMENTAL FILTERS at the Pettaconsit Pumping Station of the Providence Water Works, by Edmund B Weston, published by E. L. Freeman & Sons, Providence, R. I., 1896.

This report cannot fail to interest all those interested in water works, as it appears to give much information in regard to the action of filters upon the water, as well as upon the best mode of cleaning the filter after it may have become foul. The result of these tests made upon a large scale cannot but prove valuable to the engineer, and reflect great credit upon the State Board of Health.

CORRESPONDENCE

SAN FRANCISCO, April 2, 1896.

Editor California Architect and Building News.

DEAR SIR:—I take this method of calling your attention to my school of bricklaying. My class is composed of boys from ten years of age upwards. They take a lesson every

day after school hours from 3:30 to 4:30 P. M., also a lesson on Saturday in bricklaying including an hour in drawing to scale that which they build during the week.

The pupils learn to lay Roman, common and press brick, to construct all the specialties in the trade, such as: Roman brick fire places: French ranges; Dutch, French, Italian ovens and all work appertaining to the trade.

By the time boys have finished with their schooling they will be thorough mechanics in this line. Bricklaying carries their minds into a useful channel, teaches them not to be afraid of work, it spreads them out and makes them strong, active men.

Although bricklaying is light work it acts on all the muscles of the body and there is no better exercise for a boy cramped up in school all day than an hour's work over pure lime and sand.

My class is composed of boys of the leading contractors in the city. I would be pleased to have you call and see what the boys are doing.

S. J. PIERCE,
Manager and Instructor.

SAN FRANCISCO, April 19, 1896.

MR. EDITOR:—It has been asked why so many building contracts are let where the contractor furnishes the plans and specifications. I think I can tell you; in the first place if the plans, etc., are made by an architect, he will take a number of bids on the work, and by close competition the job will be let at a price which allows very little profit to the contractor. The architect requires to much work for the money paid, and in having the work done, has but slight consideration for the welfare of the contractor. Many of our builders, to be sure of making a good, or at least reasonable profit on their work, will furnish the plans and specifications, free to owners. They give the owner just what they have the money to pay for, perhaps not all he wants or expects, but a good job generally. They make a good showing, and any minor things not specified, can be done as cheaply after the buildings are put up and the owners have the money to pay for them, as they could be done under the contract. By furnishing the plans and specifications free, the contractor is his own boss, and gets the work at a fair price without any real competition. He is not bothered by an architect, and gets along with his work faster. He can pick up cheap materials and get bargins in ready made plaster and other ornaments, that give a flashy effect to the work, and answers just as well as the more expensive work, usually required by an architect, and will last as long as is necessary. Nearly all the buildings erected in this way are built on the installment plan, or the money comes from a Building and Loan Association, and the owners have to pay pretty large monthly installments. So you see a cheap building, that answers the purpose is as good as any other, as in a few years it is likely to be overhauled, or remodeled, anyhow. These contractors make a little money out of this business, more than they could in general competitions, they cut their buildings to suit the price paid and never loose money on their goods, and as some owners would rather have a building that is cheap and showey than a better building at greater cost this class of builders have a fair amount of business of course. In the end, there is nothing given free, the owner has to pay well for all he gets, but not being aware of it, is happy.

Yours truly, CHIPS.

NOTES AND COMMENTS

J. P. MCGILVRAY has the contract for the stone work of the new building on the site of the old American Exchange Hotel, Oregon gray stone is the stone chosen.

THE Municipal Waterworks of Santa Rosa have been completed and successfully tested to the satisfaction of the public. The water comes from two sources—artesian wells a short distance from the pumping station and the underflow in the vicinity of Santa Rosa creek. In each instance there is thorough filtration by which the water is purified.

THE Central Lumber Company, principal place of business, Hanford, capital stock, $100,000, with $20,000 subscribed, and A. J. McLeod, C. B. McLeod, B. F. McLeod, George McLeod and I Hirshfield of Bakersfield as directors.

LABOR is the curse of the world and nobody can meddle with it without becoming proportionately brutified.—*Hawthorne.*

IT IS not for reward that the best work is done.—*Jas. Cubitt.*

CEMENT FLOORS.—A correspondent wishes to know whether there is any composition or method by which an ordinary cement floor already laid can be made smooth enough for dancing purposes.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street
SETH BABSON, Pres. W. P. MOORE, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
OCTAVIUS MORGAN, PRES. A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec't. AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
GEO. W. DICKIE, Pres. W. G. CURTIS, Vice-Pres.
OTTO VON GELDERN, Sec. EDWARD T. SCHILD, Treas.

MASTER PLUMBERS' ASSOCIATION, meets every first and third Friday of each month at the Flood Building.
JAS. E. BRITT, Pres. J. L. E. Firman, Sec.

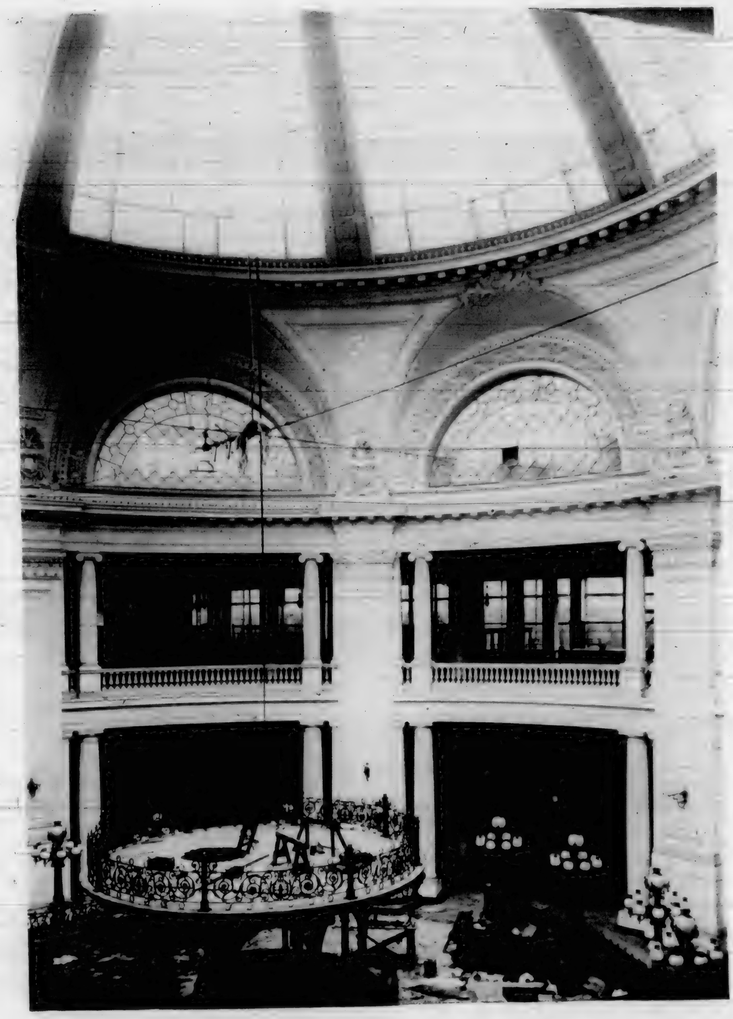
BUILDERS' EXCHANGE, Directors meet first Friday in each month at Mission and New Montgomery.
OSCAR LEWIS, Pres. JAS. A. WILSON, Sec.

MASONS' AND BUILDERS' ASSOCIATION, meet first Friday evening of each month.
ADAM BECK, Pres. M. V. BRADY, Sec.

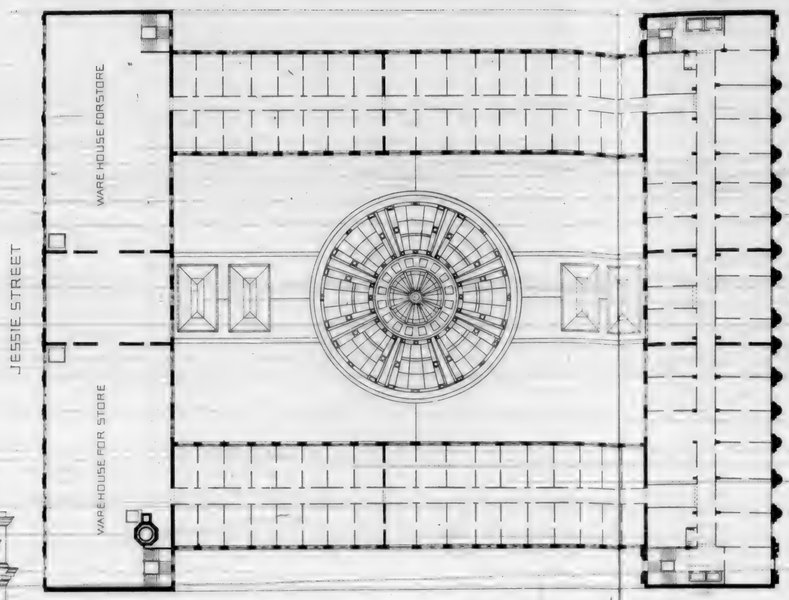
THE EMPORIUM BUILDING.

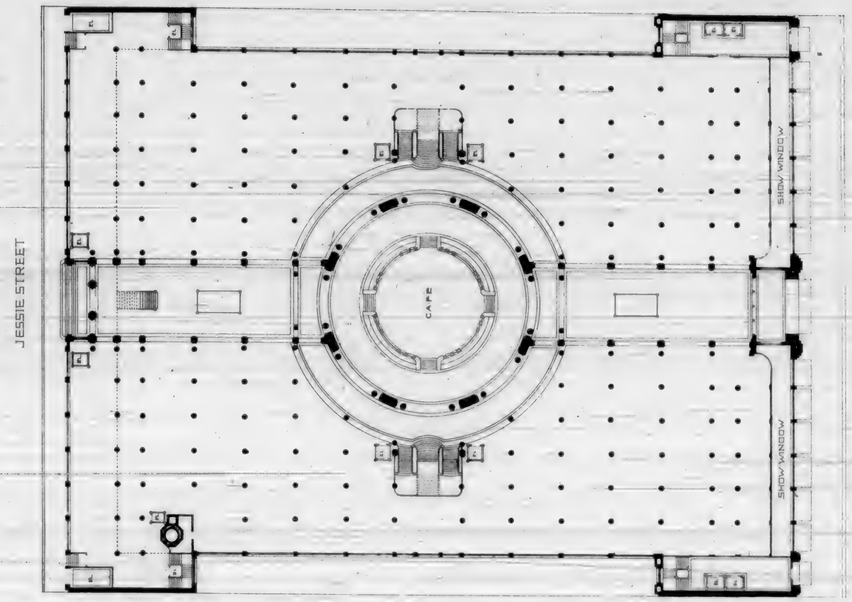
PISSIS & MOORE, ARCHITECTS.

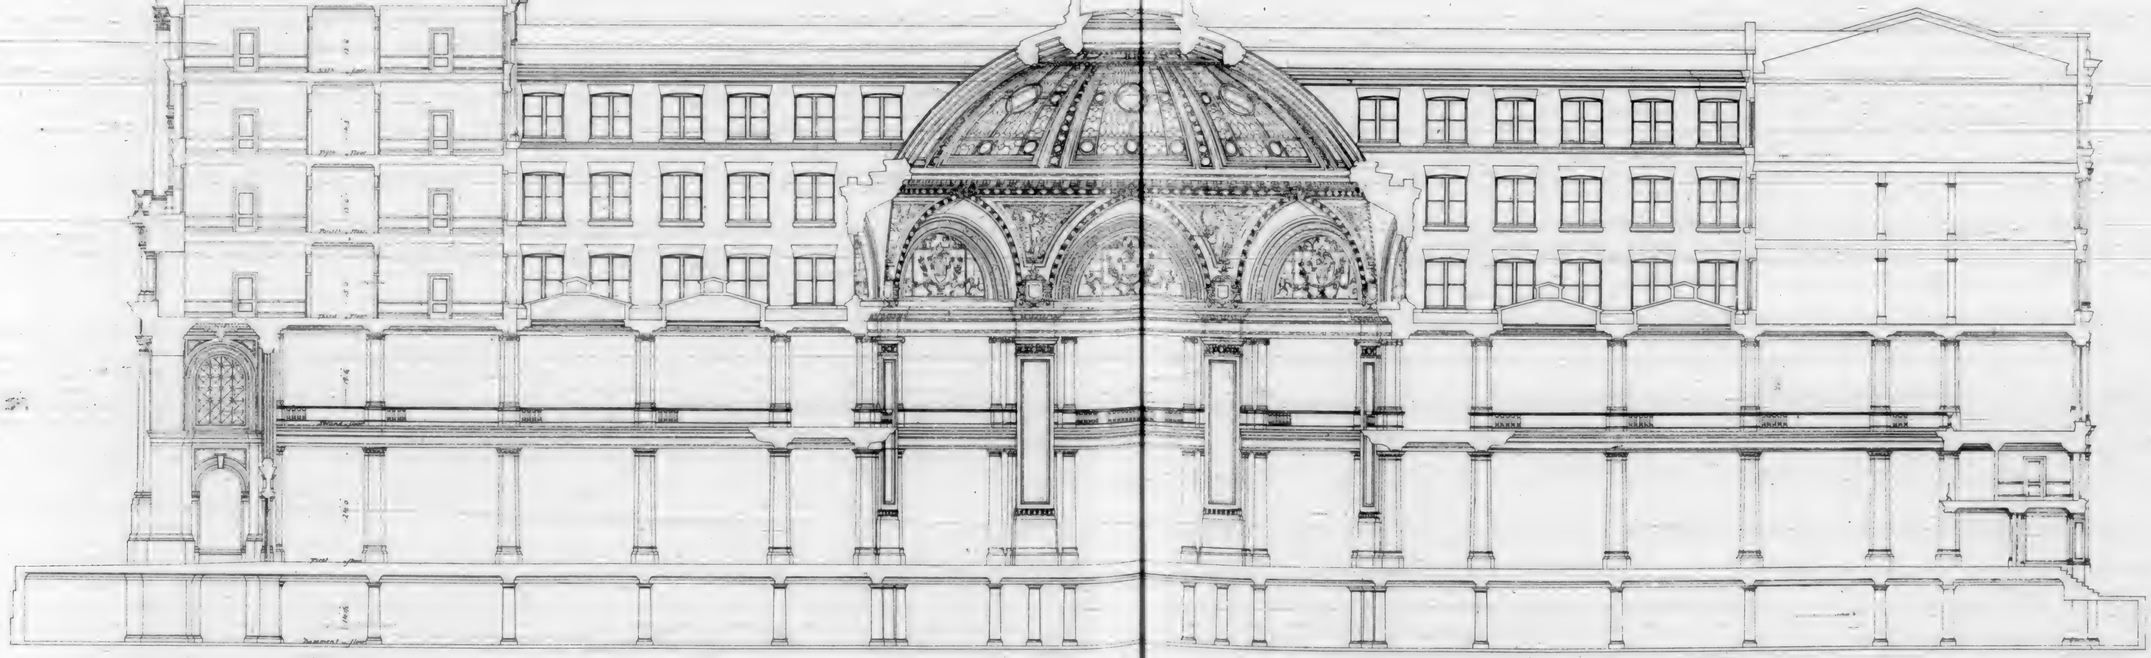
ROYAL INSTITUTE OF BRITISH ARCHITECTS
MDCCCXXXIV



GRAND-STAND, THE EMPORIUM BUILDING.







LONGITUDINAL SECTION

BUILDING FOR MRS A.M. PARROTT ON MARKET ST BETWEEN 4TH AND 5TH

PISSIS AND MOORE ARCHTS

THE EMPORIUM BUILDING.

THIS building is situated on Market street near Fifth street and is a building unique in San Francisco. The first two stories are in steel skeleton frame construction above that solid masonry walls. The whole of the superstructure is supported on columns leaving the whole ground floor, covering a space 275 feet by 250 feet, in one single room or store—which is divided off by fixtures, into the spaces for the various departments of the great Department Store that is about to occupy it.

The main naves forty feet wide form grand promenades running from end to end of the building—these are roofed with glass at a height of forty-five feet and in their centre is the rotunda 140 feet diameter, 100 feet high, covered in with a glass dome one hundred feet diameter. The store is divided into two stories by a gallery floor which overlooks the before mentioned naves.

The main staircases and elevators leading to these gallerys and to the basement, open out from either side of the rotunda and are sixteen feet wide.

The portions of the building facing on Market and Jessie

streets are carried up five stories high above the store, four of which is laid off into offices and the top one as court room and offices for the Supreme Court of California. Wings on each side join these two fronts, part of which is for offices and part for show rooms in connection with the store.

The architects are Pissis & Moore.

THE STORE FITTINGS.

The Department Store is with a few exceptions fitted up by shelving, cases and other fixtures manufactured by the the San Francisco Furniture Manufacturing Company. We hope to give some illustrations of their work in our next number together with other details of this Emporium Building which are not sufficiently completed in this number.

EXCAVATION.

The excavation, bulkheading, etc., was done by A. E. Buckman and was pushed with such energy and dispatch that the work was done within the allotted time in the contract. The extire surface of the lot excavated was 381'x275' covering a super area of 104,775 square feet; it was carried to an average depth of twenty feet making the amount of earth removed 77,000 cubic yards.

In doing this the whole Market and Jessie streets fronts had to be bulkheaded about two and one-half feet outside the curb line so as to allow the concrete foundation and area retaining wall to be built. By reason that the large water and gas mains ran along close to the bulkhead this was quite a difficult matter to overcome as they could not be disturbed a particle. So it was found necessary to bore holes along the line of the bulkhead twenty-five feet deep and into them sink 8"x8" timbers every six feet and then as the dirt was removed three inch plank was lagged up behind these posts. The whole was held in place by series of five struts each, the outer one being over forty feet long.

The piers of the columns had to go below the general surface another eight feet, and thus were below the water line—so each hole had to be sheet piled by grooved watertight sheeting and the hole kept dry while the concrete was put in; when the concrete piers were set the sheet piling was taken out, thus leaving only two inches to fill in between the natural sand and the concrete.

CEMENT.

This has been called the "Cement Age" and this building has not been behind others in justifying this sobriquet. Over 20,000 barrels of cement were used on the building in the foundations, plaster work, tiling and for the pavement of the sidewalk, for the last the "Star" brand was used, a French cement which is guaranteed by the extra precaution taken by having the French Government Inspector inspect all the barrels before leaving the works. All the balance of the cement was the "Josson". Both of these brands were supplied by W. R. Grace & Co., and their use in a building of this character indicates that the reputation these cements have had so far, has not diminished but rather increased.

CONCRETE.

The foundation piers for the steel columns were made of concrete—there were 302 piers distributed over the whole site varying in size from nine feet square to twenty-two feet square and eight feet deep. The exterior piers of both fronts and the retaining walls are fifteen feet high above basement floor and of concrete. The basement floor and side walks are artificial stone, and the foundations for engines and all other machinery are built of concrete by George Goodman, 307 Montgomery street.

GRANITE WORK.

The cappings of all the concrete piers for the reception of the steel pillars and the plinths of the stone work of the front were of granite from the Raymond Quarries in Madera Co., owned by the Raymond Granite Co.—which is noted for being free from iron oxide—and its great strength, the United States Government Ordnance Department tests showing a crushing strength of 20,000 pounds per square inch with no signs of fracture. Part of the main entrance floor is composed of a large granite slab 24'7"x6'6"x12" thick.

BRICK WORK.

All the enclosing walls except the Market street front were built of brick and made the largest contract that had ever been let in San Francisco for similar work. The material was expeditiously handled by means of four steam hoists one at each corner of the building. Richardson & Gale were the contractors.

CEMENT WORK.

The outside of these walls were cemented over with Portland cement and were plastered from swinging stages after the walls were set. The Jessie street facade is finished in cement with moulded cornices, strings, caps and bases of columns, etc., all run in cement in a clean sharp manner. This work was done by Chas. Dunlop.

STONE WORK.

The Market street facade above the store front, the large central arched entrance and the two smaller arched flanking entrances are of stone. The style is classical, very freely

treated so as to adapt it to modern wants. The three central stories are included in a Corinthian Order—consisting of a row of three-quarter columns, above which is an attic crowned by a main cornice of three feet six inches projection with modillions and a balustraded parapet. There is necessarily in the style adopted a large amount of mouldings which were all carefully cut; there is also some fine carving in the spandrils of the arches of the entrances designed with shields and foliage. The central entrance arches are twenty-five feet wide and forty feet high and built of solid through stone voussoirs. The whole work is cut out of more than ordinarily large stones and required a specially strong hoisting gear, with large steel blocks and derricks in proportion, to lift them and set them in place. All was done however without an accident or hitch of any description. Jno. P. McGilvray was the builder of this part of the building.

STONE.

The stone selected had to have the following requisites—strength and enduring qualities combined with a color suitable to the design of the building and an assurance that the stone could be furnished rapidly and in large blocks, as a large percentage of the pieces required, weighed from ten to eighteen tons each, making it difficult for ordinary quarries to furnish. The Oregon Gray Stone was adopted as being a stone and quarry fulfilling all these conditions; the result is a sandstone front which takes its rank as one of the handsomest in the United States. One of the large arch stones weighs eighteen and one-half tons. The quarry is at Yaquina Bay, Oregon, and belongs to the Pioneer Sandstone Company.

PATTERN WORK.

All the patterns for the band-stand electroliers and elevator enclosures were made by the San Francisco Pattern

Works, O. Brown, proprietor, works 110 and 112 Beale street.

WOOD WORK.

Above the third story the floors are of wooden joists, with wood flooring for the rooms and tiling for the halls, the flooring is of one and one-half wide stuff. The roof is of timber and is framed with trusses sixty-two feet span. All the offices communicate one with the other by doors, and a vista through the seventeen openings when from end to end of the building forms a remarkable perspective. F. W. Kern provided and set up all the carpentry and joinery work of the building.

The sashes are all of ash. The rear entrance on Jessie street is quite a feature in itself consisting of a wide vestibule with three sets of doors, and is finished in mahogany and oak; all the interior finish is of oak. Wm. Crocker of the San Francisco Planing Mill did the major portion of the mill work, viz: all the interior finish of the basement, first and second and mezzanine stories and the third, fourth and fifth stories of the rear building. The corridors are lighted by sashes at the top of the rooms in the usual office building style and surrounded by substantial architraves.

MOSAIC.

All floors of the corridors, halls, naves and stair landings of the department store are finished in mosaic and composed of Tesseræ of African and other foreign marbles as well as different American marbles—so laid as to make a harmonious color effect—with borders of a Grecian pattern. There are 30,000 square feet of this mosaic flooring in the building and at least 4,000,000 pieces was used in the laying of them. This work was done by W. W. Montague & Co.

HOLLOW TILE FIRE-PROOFING.

All the first, second and third floors of this building were constructed of Gladding, McBean & Company's Hollow Terra Cotta Tile Fire-proofing, in fact all the columns and girders and iron work of every description throughout the building were covered with Hollow Terra Cotta Tiles which were made and set in place by this firm.

FIRE HOSE.

In speaking of the complete equipments of this building, the fact of thorough protection against possible fires must not be overlooked. Not only has the construction of the building been such as to render the spread of fires from one part to the other practically impossible, but every precaution has been taken so that in the event of a fire originating at any point in the building, appliances are at hand by which it can be promptly checked and damage reduced to a minimum; standpipes have been laid into the walls from basement to roof, with numerous outlets to connect with fire protection hose, the total number of these being seventy-three. At each connection has been placed one of the best styles of automatic hose reel, and a sufficient supply of hose so that, from the various connections on each floor, any portion of the floor can be readily reached with a strong volume of water.

A peculiarity will be noticed in the appearance of the hose, which was selected by the architects after long and careful examination of the different articles of this description submitted to them. The hose, which is of the rubber-lined cotton variety, is a dark tan color, a condition that has been produced by the chemical treatment to which the cotton was subjected before being woven into the fabric of the hose. This process is known as the Leatheriting process, and is the exclusive property of the New York Belting & Packing Co., Ltd., who supplied the hose and reels for this building.

Insurance Companies have become more exacting in their requirements as to the character of hose for fire protection in factories and public buildings, and policy holders are now required to equip with the best and most reliable hose. The New York Belting & Packing Co. Ltd., have for many years been extensive manufacturers of fire hose, and their experiments have led to nearly all improvements now in use in connection with that branch of manufacturing. The Leatherited Cotton Hose produced by this company may be safely regarded as the highest and most successful result of these experiments, as it has been proved beyond a doubt that cotton treated by this process will resist the action of decay and the attacks of insects to a far greater degree than anything else in the shape of a cotton fabric that has been produced. The New York Belting & Packing Co. Ltd., have a branch warehouse and salesroom in this city at 509–511 Market street.

ARTISTIC METAL WORK.

The art metal work was done by the old and well-known firm, the California Artistic Metal Works, Coppieters & Mockel, proprietors, and includes the balustrades and railings of the band-stand, all the folding gates, the very elaborate and handsome newels and electroliers that will shed a radiance as of day over the throngs passing to and fro along the many aisles, and up and down the broad and spacious steps, listening to the strains of music from the great bandstand in the center of the rotunda, another piece

of work of which this firm have every reason to be proud, as it will challenge comparison with the best work of Eastern or European craftsmen. The accompanying photographic views, however, will give the reader a better idea of the artistic excellence of the work than any amount of mere verbal commendation. The firm has recently moved to more commodious quarters, located at 7, 9, 11, 13, 15 and 17 Stevenson street.

THE ROOFING OF THE MAMMOTH COURT.

The roof surrounding the dome over the great central court presented some problems quite out of the ordinary. A roof was a necessity for the protection of the many operations going on below; while at the same time the work to be done on the dome itself, the skylights, the walls, and the upper portions of the building, was of such a nature as to prove destructive to any ordinary covering. In this exigency recourse was had to Watson's five ply felt, composition and gravel roof. Four plys of tarred roofing felt were laid shingling, the laps being cemented together with roofing composition, of coal tar distilled to 600 F., a fifth ply was then laid as a cap sheet and was mopped solid to the four below, this was in turn flooded with the composition, and while the latter was still hot and liquid, clean gravel was bedded in a complete coat by being scraped into the hot composition as spread. This work was done in the fall, and during the months following, the roof was used as a lumber yard and storeroom for plastering horses, mortar beds, and debris of various kinds; materials for the finishing of the upper stories were hoisted to and passed over it in immense quantities; and scaffolding built, some three and some four stories high, to reach and plaster the surrounding walls; and notwithstanding the severe usage made necessary the roof sustained no injury. The materials used in this roof were manufactured by the Pacific Refining & Roofing Co., who also did the work. Their extensive manufacturing establishment is at the Potrero, where they make tarred roofing felts, building papers, roofing compositions, and paints, creosoting oils and other similar goods and products.

WROUGHT IRON WORK.

Besides the several iron staircases scattered about the building it is supplied with four outside fire-escape ladlers. On the Jessie street front there are two, and one in each of the light courts on each side, all with stand pipes. Traveling ladders, fitted with vertically moving seats for washing the windows of the three lower stories of the Jessie street front, which have fixed sash run on rails above and below the windows, allowing all parts of the front to be got at.

Dyer Bros., Golden West Iron Works, did this work and the stairs to the engine room in basement. They have lately moved from their old stand into more commodious quarters at 117–119 Beal street, where they have installed the largest punching and shearing machine on the Coast; this punches and cuts with ease 1½ plates of any length, angle iron and in fact any heavy structural iron; so that Dyer Bros. were fully equipped to carry out all this class of work on this building with ease and dispatch.

HOLLOW TILING.

All the partitions and wall furrings, and large flues for holding the electric wires and plumbing pipes, etc., from basement to roof, as well as the vaults, of which there are about seventy, built around the iron safes in the offices, were built of Wanner's Hollow Tiles, put up by Wanner & Maddox. The roof space was also divided, by means of the Hollow Tiling, into a number of compartments so as to prevent the spread of fire therein and altogether there were at least 300,000 square feet of partition walls. The ingredients used mainly in the manufacture of these tiles are a fire resisting cement found in the southern countries of this state and cinders and ground clinkers. The result is a light but tough concrete, weighs sixty-five pounds per cubic foot, a poor conductor of heat and sound. Manufactured into hollow blocks for partitions, it takes the place of a stud partition and not exceeding the weight of the latter. The thickness of these hollow walls are three inch and four inch in this building; the sections are generally two feet six inches long and contains about four square feet each. The faces are so corrugated or roughened as to form a good clinch for a one-fourth inch coat of plastering—each block is tongued and grooved and set in mortar.

The grounds for baseboards and chair rails are held in place by carriage bolts driven through the wall before or after plastering; picture mouldings are held in place by nails driven direct in the wall. The furring or air space veneering of the brick walls was made up in sections of same size as the hollow partitions and generally 1¼ inch thick except where pipes came up where they were made up to as thick as nine inch according to necessities. The object attained by these furrings are the prevention of dampness passing from the masonry walls and the equalization of the temperatnre inside the rooms adjacent.

PAINTING AND POLISHING.

All the woodwork of the store is painted a dead white, giving a cheerful effect to the interior and forming a background to the display of goods which doesn't in any way interfere with their colors. All the woodwork of the upper or office portion of the building is polished, leaving it with a natural finish. All the painting and polishing was done by the firm of St. Denis & Co. in their usual complete way.

PLASTERING.

The interior of the grand central rotunda is finished in plaster. The lower story has a Tuscan Order the upper an Ionic. Springing from the large paneled pilasters which run through both stories are the arches for the lunettes; the pendentives between which have panels filled in with decorative plaster above which comes the ornamental circular cornice which forms the base of the glass dome. The whole forms a magnificent *coup d'eil* which it is hard to surpass. All this difficult and elaborate work has been carried out successfully by Mr. D. O'Sullivan, the contractor for the plaster work. The whole of the plastering of the store portion of the building, together with the paneled ceiling of the entrance vestibule was also done by Mr. O'Sullivan.

ART METAL WORK.

Winslow Bros. of Chicago, furnished and set up the metal work of the Market street front, the entrance vestibules and doors, the two large main stair railings, with the adjoining elevator enclosure and the balustrades around the two large light wells on the main floor lighting the basement.

All the store fronts are made of Duplex plated iron, the plating having a coppery bronze effect. The rebates of the sash for the reception of the large sheets of plate glass are made particularly straight and true so that the glass fits close to them throughout. The same may be said of the door frames. The Market street entrance doors are covered

with the galvano-plastic material for which Winslow Bros. are noted.

The enormous semi-circular light filling in the entrance arch is made of the same material with ornamental frame. The before mentioned elevator enclosures have the corner pilasters, frieze and cornices of electro plated copper and the filling in of Bower-barffed iron. The railing of the stairs, landings and wells being composed of ornamented balusters gives a substantial effect not otherwise obtained. This metal work railing is capped by a broad mahogany capping which was made and fitted by Mr. H. M. Frick of this city.

The circular newel posts at the foot of the rotunda staircases surmounted by the electroliers with their urn-like standards are remarkable for the beauty of their design and execution.

URINALS AND SINKS.

The Urinals in this building are the Patent Lenox Urinals made exclusively by The J. L. Mott Iron Works and the Imperial Porcelain Slop Sinks were also furnished by the same company.

HEATING.

The building is heated by steam at a low pressure, either exhaust steam from the engines, or steam taken direct from the boilers and reduced in pressure.

The system of piping used is the single pipe, overhead system; the main steam pipe is run directly from the boiler room to the attic over the fifth floor on the Jessie street side. This main steam pipe is cross-connected so that either exhaust steam from the engines or live steam from the boilers can be used. A Davis Reducing Pressure Valve with a by-pass is used for this latter connection. In the attic the main steam pipe is divided into two mains and run in each wing to the Market street front. These mains reduce in size from eight inch to four inch as the drops for supplying the radiators are taken from them. The drops are taken from the bottom of the steam mains with a nipple and forty-five degree Ell, each drop having a gate valve. The drops are carried down full size, concealed behind the finish of the columns, to the radiators on the first floor, where they are reduced to one-half size. All connections to radiators are made under the floors. In the basement the radiators are semi hot water radiators, being connected top and bottom. The piping is of ample size to insure a rapid and noiseless circulation of steam at one-half pound pressure. The return mains in the basement are galvanized iron pipe encased in terra cotta sewer pipe cemented at the joints, water tight. This manner of running the returns is necessitated by the seepage water being near the surface. These mains are run into a sump built of concrete from which the condensed water is pumped back into the boiler. The main steam pipes are covered with Magnesia Sectional Covering. The Detroit Ornamental Fluted Radiator, manufactured by the American Radiator Company, is the radiato used. Each office, the stores on the first and second floors and the restaurant in the basement, are supplied with radiation. The radiators in the offices are twenty-five inches high and those in the stores and basement are thirty-eight inches high; the total amount of radiation, when the building is completed will be 16,000 square feet. All the latest scientific appliances for the better control and regulation of steam systems are used on this plant and it is one of the most perfect in use on the Pacific Coast. The plant was put in by the Geo. H. Tay Co.

ENCAUSTIC TILING.

All the corridors of the upper portion of the Parrott Building are laid in encaustic tile; the prevailing tints and designs are light gray octagons with red dots. The border is a Greek fret ornament with chocolate boundary lines. This is the largest contract for tiling that has ever been undertaken on this Coast, consisting of about 22,000 square feet. Thos. F. Rigney of 119 Valencia street is the contractor of this work, and we must congratulate him on the fine workmanship he has displayed in this building. These encaustic tiles are practically unwearable and when laid in a fine bed of concrete as they are in this case, while the building lasts the floor will last.

SIDEWALK LIGHTS.

The Sidewalk Lights are made in large steel and stone illuminating slabs, each extending from beam to beam without intermediate supporting bearers, which permits of there being glass where such bearers, would be; besides the steel bottoms are galvanized which prevents discoloration of the paint by rust. These slabs are fire and burglar proof and will sustain loads of not less than 500 pounds per square foot, and extend continuously the whole length of the Market street front nine feet wide. On the Jessie street front the steps to the entrances are all made of illuminating tile treads and risers as well as the sidewalk lights. P. H. Jackson & Co., manufactured and set this work, also the water-tight iron sidewalk doors of which there are six on Jessie street.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Acceptance of Building.—Where an owner accepts a building the contractor is entitled to its value as constructed, though not in all respects as contracted for, and owner is entitled to the difference between the value of the house as built and as contracted for. To recover the purchase under a building contract, only a substantial and not a literal compliance with the contract must be shown.
Jennings v. Willer, Ct. Civ. App. Tex., 32 S. W. Rep. 24.

Damages for Delay in Completion of Building.—A clause in a building contract providing that the contractors should pay a certain sum for delay in completing the building must be treated as a penalty, and not as liquidated damages where the only damage suffered was the delay in the occupation of the new house, the difference between the rental value thereof, and of the house occupied during the delay being considerably less then the sum stipulated to be paid.
Jennings v. Willer, Ct. Civ. App. Tex., 32 S. W. Rep. 24.

Liabilities under a Non-Trading Partnership.—A partnership formed to carry on the business of general contractors and builders being a non-trading partnership, a person who accepts from one of the partners a firm note, signed by him, and secured on the firm's chattels, is charged with notice that under the partnership agreement the partner had no authority to execute the note or mortgage on behalf of the firm.
Snively v. Matheson, Supreme Ct. Washington, 40 Pac. Rep. 628.

Lien not Lost By Taking Notes.—The holder of a mechanic's lien, who takes for his account, notes of his debtor, maturing within the time allowed for fsreclosure of the lien, which he discounts and afterwards pays, does not thereby waive or lose his rank as a lien holder, or his right to file and enforce his claim to a lien.
Wisconsin Trust Co. v. Robinson & Cary Co. 68 Feb. Rep. 778.

Payment for Partial Performance of Contract.—It is well settled that where one party has entered into a special contract to perform work for another and furnish material, and the work is done and material furnished, but not in the manner stipulated in the contract, yet if the work and materials are of any value and benefit to the party, he may recover for the work done and materials furnished. This upon the principal that, if the other party has derived a benefit from the part performed, it would be unjust to allow him to retain that without paying anything. The more equable rule has been generally adopted, which pemits a recovery by one who in good faith attempts to perform his contract, and does so substantially, although there may be a slight deviation, or some technical and unimportant omission or defect. A substantial performance, however, is still indispensable to a recovery, and a failure to carry out any material part of the contract will not amount to a substantial performance. And where a party, by an express contract, undertakes to furnish material and perform labor, he is only entitled to payment according to its terms, and the law will not make for him a contract different from that which the parties have entered into. The implied liability arises, if at all, from the subsequent transaction or conduct of the parties, and if there is a substantial non-performance of the contract, and the party for whom the materials were furnished and the labor performed refuses to accept, and does not receive or retain, any of the benefits of the contract, no such liability will arise.
Modell Tp. of Norton County v. King Iron-Bridge Co., Court of Appeals of Kansas, 41 Pac. Rep. 1059.

Materials Furnished Lessee, Lien on Interest of Lessor.—Under the statute, providing that, where a building shall be erected by a lessee or by a builder or other person employed by such lessee, the lien shall apply only to the extent of the interest of the lessee, a lessor's reversion cannot be subjected to the payment of the claim of one who, after making full inquiry as to the lessee's responsibility, and knowing the nature of the contract between him and the lessor, sold him brick for buildings on the leased premises.
Hoffman v. McColgan, Court of Appeals of Maryland, 32 At. Rep. 179.

CITY BUILDING NEWS.

Ashbury near Waller, Two-story frame; owner, J. Stierlein; day's work; cost $10,000.

Baker near Washington. Two-story frame; owner, Channing H. Cook; architect, D. J. Patterson; contractor, William Linden; signed, March 17; filed, March 28; cost $4885.

Belvedere near Frederick. Two-story frame; owner, William Hinkel; architect, Herman & Swain; contractors, Petterson & Pearson; signed, March 5; filed, March 6; cost $3250.

Belvedere near Frederick. To build; owner, A. H. and Theresia Johnson; contractor, W. W. Rednall; signed, March 31; filed, April 2; cost $1975.

Belvedere near Waller. Two-story frame; owner, P. E. Smith; contractor, W. W. Rednall; signed, Morch 31; filed, April 4; cost $3700.

Bush near Laguna. Two-story frame, owner, William Geist; architects, Laist & Schwerdt; contractor, John T. Hayes; signed, March 7; filed, March 14; cost $4170.

California near Scott. Alterations and additions; owner, Mrs. Hettie H. Rehfish; architect, J. H. Littlefield; signed, April 4; filed, April 7; cost $2797.

California near Second Ave. Cottage; owner, Rasmus Anderson; architect, J. H. Littlefield; contractor, W. Chatham; signed, March 9; filed, March 16; cost $1348.

California and Baker. Carpenter work; owner, Mrs. Mayble E. Denervaud; architects, Smith & Freeman; contractors, J. H. Simpson and A. T. Spence; signed, March 18; filed, March 25; cost $2740.

California near Broderick. Two-story frame; owner, Gotelli; architect, C. M. Rousseau; contractor, R. J. Pavert; signed, March 24; filed, March 25; cost $2094.

Castro near 28th. Cottage; owner, Mrs. Dora Wood; contractor, T. R. Bassett; signed, March 5; filed, March 16; cost $1325.

Clement near 12th Ave. Frame dwelling; owner, Samuel Goodman; cost $1800.

Clay near Laurel. Two-story frame; owner, C. P. Stanford; architect, Louis S. Stone; contractor, August Lund; signed, March 18; filed, March 24; cost $4586.

Clay and Sansome. Alterations; owner, R. R. Thompson; superintendent, G. H. Moore; day's work; cost $2500.

Davis near California. Concrete, twisted iron, etc.; owner, Mrs. Ellen Folger; architects, Percy & Hamilton; contractors, Keatinge, Leonard & Ransome; signed, April 3; filed, April 3; cost $3648.

Davis near California. Cast and wrough iron work, etc., owner, Mrs. Ellen Folger; architects, Percy & Hamilton; contractor, Western Iron Works; signed, April 2; filed, April 4; cost $3285.

Davis and California. Brick work, etc., to six-story brick; owner, Mrs. Ellen Folger; architects, Percy & Hamilton; contractors, Riley & Loane; signed, April 3; filed, April 4; cost $9872.

Davis near California. Carpentery, mill work, etc.; owner, Mrs. Ellen Folger; architects, Percy & Hamilton; contractor, Silas Carle; signed, April 2; filed, April 4; cost $9560.

Devisadero near McAllister. To build; owner, Mrs. Emilie Bramas; architect, W. Koenig; contractor, Ira W. Coburn; signed, March 18; filed, March 27; cost $2340.

Devisdero and Turk. Plumbing, etc.; owner, Mrs. Carolina A. Bollman; architect, Wm. Koenig; contractor, W. Williamson; signed, March 19; filed, March 21; cost $2775.

Devisadero and Turk. Four two-story frames; owner, Caroline A. Bollman architect, Wm. Koenig; contractor, H. P. Conrady; signed, March 14; filed, March 14; cost $15,120.

De Long Ave. near Frederick. To build; owner, Clara A. Cook; contractor, Marcuse & Remmel; signed, March 18; filed, March 23; cost $3100.

Dupont near Bush. Additions and repairs; owner, J. B. Dolet; architect; Emil Depierre; contractor, Jean Salanave; signed, March 21; filed, March 21; cost $2000.

Eddy and Powell. Electric elevator; owner, E. W. Hopkins; architect, Clinton Day; contractors, A. J. McNicoll & Co.; signed, March 30; filed, April 1; cost $2200.

Fell near Lyon. To build except plumbing; owner, Emma Joseph; architect, W. H. Lillie; contractors, White Bros.; signed, April 6; filed, April 8, cost $9270.

Fell near Lyon. Plumbing, etc.; owner, Emma Joseph; architect, W. H. Lillie, contractor, G. C. Sweeney; signed, April 6; filed, April 8; cost $1100.

Fell near Scott. To build; owner, Daniel Eirstein; day's work; cost $4500.

Fourth Ave. near Point Lobos. To build; owners, Mr. and Mrs. H. V. Richit; contractor, E. Ginley; signed, March 3; filed, March 3; cost $2500.

Folsom near 16th. Excavations, concrete, etc.; owner, Enterprise Brewery Co.; architect, H. Geilfuss; contractors, Miller & Beck; signed, March 18; filed, March 18; cost $1275.

Folsom near 16th. Steel construction; owner, Enterprise Brewery Co.; architect, H. Geilfuss; contractors, Schrader & Lutze; signed, March 18; filed, March 18; cost $2100.

Folsom and 25th. To build; owner, Edward Gentry; architect, Chas. M. Rousseau; contractors, Williams & Forten; signed, April 4; filed, April 7; cost $11,025.

Frederick and Clayton. Two two-story frames; owner, Mrs. Margaret Rippon; architect, W. Koenig; signed, April 6; filed, April 7; cost $5744.

Geary near Hyde. To build; owner, Dr. A. Abrams; contractor, H. Jacks; signed, April 1; filed, April 4; cost $6850.

Green near Buchanan. To build; owner, Annie M. Seale; architect, W. O. Banks; contractor, G. H. Walker; signed, March 5; filed, March 13; cost $3800.

Howard near 22d. To build, except plumbing, painting, etc; owner, Herman Zweig; architects, Kenitzer & Barth; contractor, Charles Schutt; signed, March 18; filed, March 19; cost $6700.

Howard near 5th. To build; owner, J. G. Lavonsaler; contractor, G. A. Fisher; signed, March 30; filed, March 30; cost $9000.

Hyde near Green. To build; owner, J. F. Kydd; architects, Mooser & Son; contractors, Westerlund & Sandeen; signed, April 2; filed, April 6; cost $3128.

Jackson near Montgomery. Alterations and additions to brick; owner, Marguerite V. Merle; architect, T. J. Welsh; contractor, M. V. Brady; signed, March 14; filed, March 21; cost $3410.

Lake near 3d Ave. Two-story frame; owner, Mrs. Louisa M. Chase; contractor, Dan P. Dolan; signed, March 14; filed, March 23; cost $1750.

Lott near Waller. One-story frame; owner, Adele L. Rodgers and Isabella M. Rodgers; architect, J. C. Newsom; contractors, Simpson & Spence; signed, March 17; filed, April 3; cost $2177.

Lyon and McAllister. To build; owner, Martin Meyer; architect, Emil John; contractor, Jas. Bucher; signed, March 23; filed, March 27; cost $9681.

Market near 5th. Cafe fixtures, etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, S. F. Furniture Mfg. Co.; signed, March 5; filed March 16; cost $8140.

Market near 5th. Fixtures, etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, S. F. Furniture Mnfg. Co.; signed, Feb. 20; filed, March 5; cost $9772.

Market nr 5th. Partitions, tables, etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractors, S. F. Furniture Co.; signed, Feb. 18; filed, March 5; cost $5362.85.

Market street Ferry Depot. All iron and steel work; owners, Board of Harbor Commissioners; architect, E. R. Swain; contractor, Risdon Iron Works; cost $188,000.

Market near Jones. Alterations and additions; owner, Thos. P. Dunne; architect, A. J. Barnett; contractor, T. D. Gilmore; signed, March 23; filed, March 24; cost $1400.

Market and Third. Steel and iron work, owner, Claus Spreckels; architects, Reid Bros.; contractor, Pacific Rolling Mills; signed, March 23; filed, April 1; cost $118,792.32.

Masonic Ave. and Waller. Three frame dwellings; owners, architects and contractors, Cranston & Keenan; cost $24,400.

McAllister near Hyde. Basement floors, etc.; owner, California Bible Society; architects, McDougall & Son; contractor, Gray Bros.; signed, March 23; filed, March 25; cost $1875.

Minnesota near 22d. Cottage; owner, Chas. Berger; contractor, R. O. Davis signed, March 23; filed, March 25; cost $1983.

Ninth Ave. near Point Lobos. Two-story frame; owner, Margaret Clark; contractor, P. Demartini; signed, March 11; filed, March 12; cost $1950.

Ocean House Road. Two-story frames; owner, The Pacific Jockey Club; architect, T. J. Welsh; contractor, Geo. H. Walker; signed, March 26; filed, March 30; cost $11,730.

Pacific street Wharf. Sheds; owner, Board of Harbor Commissioners; contractors, Healy, Tibbitts & Co.; cost $7893.

Parker Ave. near Pt. Lobos. Two-story frame; owner, James J. Harrison; contractor, Otten & Sorenson; signed, March 12; filed, March 14; cost $2065.

Post near Stockton. Granite and sandstone for six-story brick; owner, Hobart Estate Co.; architects, Percy & Hamilton; contractor, John D. McGilvray; signed, Feb. 29; filed, March 14; cost $14,810.

Pine near Powell. Twelve apartment houses; owner, Clara L. Cunningham; architect, Clinton Day; contractor, S. H. Kent; signed, March 24; filed, March 25; cost $36,697.

Precita Ave. lot 2. Frame building; owners, Horace and David Newell; contractor, R. Fahy; signed, April 6; filed, 6; cost $1712.

Steuart near Mission. Elevators; owner, E. R. Lilienthal; architect, Clinton Day; contractor, W. L. Holman; signed, March 2; filed, March 27; cost $1500.

Sutter near Van Ness. Alterations; owner, Mrs. Amelia L. Leszenski; architect Salfield & Kohlberg; contractors, Charles Condy; signed, March 6; filed, March 25; cost $3250.

Sacramento near Walnut. Two-story frame; owner, Vincenzo Lorenzini; contractors, Cuneo & Cavaglia; signed, March 16; filed, March 18; cost $5100.

Second Ave. near Clement. Two-story frame; owner, Catharena Mehrtens; contractor, Jas. McConahey; signed, April 1; filed, April 2; cost $2440.

Scott near Union. Two-story frame; owner, Margaret J. McNamara; architect, E. A. Mathews; contractors, Knox & Cook; cost $4188.

Second Ave. near Clement. To build; owner, Abraham Lowenstein; contractor, W. W. Redmall; signed, April 1; filed, April 1; cost $2100.

Sutter near Hyde. Additions and alterations; owner, E. Edith Crane; architects, Herman & Swain, contractor, W. H. Bagge; signed, March 11; filed, April 1; cost $2575.

Seventeenth near California. Cottage; owner, E. L. Holder; cost $1800.

Twelfth Ave. near Lake. Cottage; owner, Mrs. Mary H. Atkinson; contractor, L. T. Fenn; signed, April 6; filed, April 7; cost $1216.

Twelfth near H. Cottages; owner and builder; Mr. Williams; cost $4,000.

Tenth Ave. near Pt. Lobos. Cottages; owner, T. G. Parker; contractor, H. Byerly; signed, April 1; filed, April 1; cost $2500.

Twentieth near Diamond. To build; owner, B. Crowley; contractor, T. F. Mitchell; signed, April 2; filed, April 2; cost $2967.

Twenty-fourth near Folsom. To build; owners, Russ Bros.; architects, De Prosse & Meusdorffer; contractors, Wenochl & Franz; signed, April 2; filed April 3; cost $4000.

Twenty-fourth near Folsom. Excavations and brick work; owner, Russ Bros. architects, De Prosse & Meusdorffer; contractor, Chas. Wagner; signed, April 1; filed, April 3; cost $590.

Twenty-fourth and Clement. Cottage; owner, Joseph Joost; day's work; cost $2000.

Twenty-fifth and Folsom. To build; owner, Mrs. A. C. Kratz; contractor, E. W. Hyde; signed, April 1; filed, April 2; cost $5700.

Twenty-seventh near Point Lobos Ave. Cottage; owner, William Conlin builder, M. J. Scott; cost $1000.

Twenty-first Ave. near Pt. Lobos. Cottage; owner, Geo. Hodnett; builder, J T. McInnis; cose $1000.

Twenty-ninth near Dolores. Flats and additions; owner, Claus Linderman architect, W. C. Hamerton; cost $3350.

Twenty-ninth near Noe. To build except brick work, etc.; owner, R. Trost; day's work; cost $2700.

Townsend and Stanford. Two-story brick; owner, Ingelnook Vineyard Agency; architect, Clinton Day; contractor, John McCarty; signed, April 2; filed, April 4; cost $8,000.

Townsend and Stanford. Carpenter work, painting, etc.; owner, Ingelnook Vineyard Agency; architect, Clinton Day, contractor, C. Chisholm; signed, April 2; filed, April 2; cost $4036.

Waller and Clayton. To build; owner, Peter E. and Carrie M. Lammers; architect, Oliver Everett; contractor, Jacob Schuler; signed, March 1; filed, March 2; cost $5,050.

Waller near Steiner. To build; owner, G. Depaoli; architect, E. J. Vogel; contractor, R. Fahy; signed, April 1; filed, April 3; cost $4768.

Waller near Devisadero. Additional story; owner, W. B. Morris; architect, W H. Lillie; contractors, Moore & Cameron; signed, April 6; filed, April 9; cost $2640.

York near 22d. Frame work; owner, Henry Picke; contractor, J. E. Schulz; cost $1700.

Valencia and Stable Alley. Plumbing and gas fitting; owner, Mrs. Rose A Pickering; architects, Havens & Toepke; contractor, H. Williamson; signed, March 1; filed, March 3; cost $1574.

EXISTING POST-OFFICE BUILDING AT SAN FRANCISCO, CALIFORNIA.

PREMISES OF NEW SAN FRANCISCO POST-OFFICE, AUTHORIZED BY ACT OF CONGRESS, MARCH, 1887.

WE publish herewith photographs of the old San Francisco Post-office Building, surrounded with the different wooden sheds that have from time to time been required to meet the needs of a growing city, and also a view of the new post-office premises, authorized by Congress almost a decade ago, and designed to provide adequate accommodation for the postal business of the metropolis of the Pacific Coast.

Possibly our honored Secretary of the Treasury considers we San Franciscans to be a very ill-bred and importunate people, in becoming impatient at such a trifling delay as nine years. What is nine years in the life of a city, why it has taken twice that length of time for us to build a City Hall, and it isn't built yet; and perhaps he thinks if it takes us eighteen years to construct a Municipal building that he should be excused for taking nine years to commence work on a Federal building. Is not the greater dignity of a Federal official to be taken into consideration? Large bodies are proverbially slow in "getting a move on" and the Honorable Secretary of the Treasury is a man of wait (at least he has shown himself to be in this matter.)

Perhaps, however, we may be doing an injustice. It is possible that it is the Supervising Architect of the Treasury

Department who is at fault in the matter. We can readily imagine the despair of an ambitious architect, anxious to surpass some *chef d'œuvre* that has awakened his admiration, and vainly racking his brains in the hopeless attempt. Look at the present main entrance to the old Post-office

Building! verily it would be difficult to design anything more noble and inspiring. Is it not an imposing piece of work? How symetrical is the spacing of voids and solids. How nobly is the severe plainness of the flanking walls relieved by the mullion windows on either side; and in the crowning entablature, see how the æsthetic jig saw has decorated the ornamental portions of the cornice. It is true the shade trees somewhat hide or rather mask the real beauties of the facade, but the glimpses, half concealed and half revealed but whet the imagination, and the trees themselves! how appropriate as rural adornments, how suitable for the little occidental village of San Francisco—how typical of the pastoral life of the wild and woolly west. And then look at the facilities for illuminating the building on fete days and gala occasions. No parsimonious economy can be observed here; instead of the usual single lamp-post that adorns the crossing of the streets, here we have them scattered with lavish hand, not one, but *two*, harmoniously disposed on either side, and gaily decorated with red and green paint. No wonder that the presiding genius of the architect's shop in Washington is dubious about his ability to rival the master hand here displayed—what barbarians must we be to desire the demolition and eternal destruction of such art treasures. Only a few years ago a brand new coat of stucco was applied to such portions of the original walls as remained in place, and the wooden walls of the new lean-to's were painted. Surely the administration is showing a praise-worthy economy in securing the utmost wear out of the coat of paint and stucco. Economy is a virtue and should be inculcated in the masses by precept and example.

Then look at the practical method by which our good government teaches us economy in small things. The fences surrounding the new site are covered with advertisements and not ordinary cheap advertisements but advertisements done in oil, real artistic art, thus encouraging and cultivating the æsthetic sentiment of the people as well as instructing them in the principles of hygiene. Talk about our government not being paternal! Why it even goes so far as to be maternal in its solicitude for the daily habits by which health is preserved, and teaches us what physic is the best to use. So in place of criticizing the government for its lack of action, we should commend it for its masterful inactivity, and hope that we shall reap in the future the rewards of present parsimonies and discomforts.

THERE is an agitation going on by property owners and others in the neighborhood of the Old City Hall site calling for the immediate erection of a Jail and Criminal Court's Building, thereon. One would have thought that such a building as this would not be a very desirable neighbor and the clamor to have it erected appears rather astonishing. This must be one of the anomalies of the present age—for an ordinary sane person would surely not be anxious to have the sight of his friends and customers constantly regaled by views of the patrol wagon with dubious characters therein, and the ambulance with smashed up humanity rattling up every little while, or the loafing, spitting, beer soaked products of modern civilization that are to be found frequently in the environs of such a building.

There is no doubt that the vacant lot should not be allowed to lie idle; but there are plenty of pleasant remunerative uses to which it can be put—e. g., the city could build a large emporium building on the site for the use of the north end of town and either run the business located therein themselves or let it out to tradesmen—or use it for a recreation building for the people; a People's Palace for healthy, rational enjoyment; a more effective way of getting rid of houses of questionable resort than by police force. By either scheme, an income will be obtained for the City instead of a continuous outcome—as will be the case should the supervisors be amenable to the pressure brought upon them by the aforesaid agitation.

OUR attention has been called to an article in the *Builder and Contractor* published at Los Angeles under the head of "Advertising Schemes," it is directed against the business of fake advertisement by means of "leaflets" and "souvenirs" and the method of inducing respectable merchants to advertise under the threat that the architects will not recognize the dealer who does not do so, now this can fairly be called blackmail and should be frowned upon by all respectable architect. It is generally acknowledged by those most capable of judging that the leaflet and souvenir are so much waste paper as far as having any effect upon the purchaser, and therefore any money spent upon such useless trash is money thrown away.

Any person claiming to have the power to prevent the specification of any article of real merit by architects may be set down as a *fraud*.

The architects business and interest is to specify what he considers for the best interest of his employer, regardless of any consideration of friendship or selfishness. Consequently the merchant and manufacturer are perfectly safe in defying any attempt to force him to advertise under the fear of being boycotted by any respectable architect.

The extract below shows the whole nefarious business in its true light and is fully indorsed by the editor:

"We have had occasion from time to time to warn architects, material men and others of the building trades against a certain class of fake advertisers, who happen along at stray seasons and proceed to 'work' everybody and everything in sight for their own behoof; having done so, they clear themselves out, leaving advertisers exhausted and the public flushed with a lot of trash that results of no benefit to the advertiser, nor anyone else, except the fakir.

"Our continued calling attention to this character of itinerents has operated to keep these fellows from pestering advertisers to a considerable extent. They have come to realize that to go to a material-man with any of their fakes, however 'novel,' is worse than useless, so long as said fake has nothing to rest upon but its own merit. Lately, however, they have taken another cut; instead of going to the material-man, showing to him their scheme and soliciting his 'ad,' they bring a force to bear upon him to *compel* him to advertise upon the peril of a loss of prospective trade in his refusal to do so.

SENATOR RAVEY'S BILL.

HIS MEASURE TO LIMIT THE HEIGHT OF BUILDINGS.

The full text of the bill introduced in the New York Legislature by Senator Pavey, at the instance of the City Club of New York, limiting the height of buildings, is as follows:

Section 1. No building shall hereafter be erected in the City of New York in which any floor occupied or used, or intended to be occupied or used, in part or in whole, for working rooms, living rooms, bedrooms, salesrooms, storage offices, or manufacturing purposes, shall be of greater height above the curb level at the centre of the front than fifteen times the square root of the width of the street, road, or avenue on which it is erected, and whenever any building shall front on a street, road, or avenue over 100 feet in width its width shall be taken to be one hundred feet in making this calculation; provided, however, that where any portion of a building shall be set back from the street line the upper floor of the part set back may be carried to an additional height of twice the distance to which it is set back from the street line, and provided further, that where a building shall be built on a corner formed by the intersection of two streets, roads, or avenues, one of which is narrower than the other, the front on the narrower street may be built to the height of the front on the wider street for a distance of 100 feet.

Sec. 2. Where a lot fronts on a public square or open public square, or where the street, road, or avenue on which it fronts is more than 100 feet wide, or where it is opposite the end of a street more that sixty feet wide, the upper floor of any building to be erected thereon may be carried to a greater height above the curb than is above provided; provided, however, that the design and plan for such building shall be approved as being neither detrimental to the health or comfort of the citizens, nor injurious to the beauty of the city; such approval shall be evinced by a certificate in writing, signed by the President of the Health Department of the City of New York, the Superintendent of Buildings of said city; and a member of the Council of the Fine Arts Federation to be appointed from its membership for such purpose, and such certificate, signed by all said persons, shall be filed with the plans of such improvement in the Department of Buildings of said city.

Sec. 3. Nothing in this act contained shall be held or construed to effect buildings already erected, or for the erection of which there have been filed in the Department of Buildings, complete and perfect plans, such as are actually required by the department under existing rules before a permit to build be granted; providing, however, that the work on such buildings shall be actually commenced within sixty days from the passage of this act. If work on any such buildings shall not be commdnced within sixty days from the passage of this act, such buildings shall be deemed to be governed by the provisions of this act, as though no plans had been filed.

Sec. 4. This act shall take effect immediately.

THE SUPERVISING ARCHITECT'S OFFICE BILL.

THE following circular letter is issued to the public by the committee in charge of the Aldrich bill now before Congress, and gives a clear statement of the importance of the bill to the general public and individuals as well, asking general co-operation in securing its passage:

New York, March 24, 1896.

Dear Sir:—It is well known to every public-spirited citizen, and especially to those interested in matters of art, that the present system of designing and erecting the federal buildings of the United States through the agency of the Supervising Architect's office at Washington is the outgrowth of an antiquated and inadequate method, which should have been changed long ago.

The absolutely unsatisfactory results of the present system are apparent to us in the lack of originality and artistic merit of our public buildings, which are constructed after a set pattern, at an expense greatly exceeding the cost of the same class of work and demanding at least three times as long to construct as when built by private enterprise.

Various attempts have been made by the profession, by legislation and otherwise, to remedy these evils. The last attempt was the introduction in the fifty-third Congress of the "McKaig" bill, entitled "A bill to provide for the securing of plans and for the erection of the public buildings of the United States."

This bill provides for the creation of an expert commission, appointed by the President, with the approval of the Senate, to have charge of the architectural work of the government; to select designs, in competitions to be conducted by this commission, for each new building, and to appoint the architect of the building, as in private practice, leaving the Supervising Architect as the representative of the government in all matters connected with the erection and completion of the buildings, and the payment therefor.

In other words, this bill proposes, by a system of competitions, conducted under proper authority, to obtain for our federal buildings the very best designs and the very best architectural skill now available, relieving the supervising Architect's office entirely of the duty of designing, but leaving the supervising Architect in charge of the work

as the representative of the government in all matters of business or general supervision.

The federal buildings would then be under the charge of leading architects in the different sections of the country where they are to be erected. They would become individual to the locality and the outgrowth of the same, not only in design, but in construction and materials. They would also receive constant supervision, and would be built as promptly and as economically as buildings for private individuals.

The Supervising Architect would become the supervisor of the architects commissioned by the government; his duties would be simplified in one direction, and thus give him more time to attend to his important duties in other directions. He would also be able to devote much of his time to collecting and diffusing valuable statistics and information concerning materials and many other matters pertaining to building, so that the profession at large would be able to draw upon Washington for general information, as is now the case with engineers, agriculturalists and other important bodies.

Such a bill must result in better and more prompt and economical methods for the government, in better and more beautiful buildings for the public, and also in raising the standard of architecture, both artistically and otherwise, in the United States.

The "McKaig bill," though drawn at the suggestion of the Secretary of the Treasury and revised by him, was defeated for political reasons. It has been reintroduced in the present Congress and the outlook for its passage is very avorable.

The architects of the country have devoted much time to this work, and have so far subscribed all the necessary funds for legitimate purposes inintroducing and promoting the bill. They find, however, that the work of promoting the bill in a perfectly legitimate way requires ample funds, which they are not in a position to furnish entirely, and they have further found that they are taxed with selfish motives in promoting the bill.

As it is a matter which should interest every public-spirited citizen, as stated above, and which from a business point of view will benefit every individual community where federal work is contemplated, by affording each community the opportunity of erecting its own buildings with local materials supplied by local people, the whole building being under local influence, instead of the present system, where everything is centralized in Washington, to the benefit of a few large contractors who control to a great extent the work and the supplies, not only ignoring local requirements, but in most instances thrusting aside excellent opportunities for local development, it has been decided by the committee in charge of the bill to appeal, through the architects of the country, to the public at large for subscriptions for the purpose of furthering the interests of this bill. Such subscriptions will be not only of material aid, but they will give the bill a very strong moral support by proving that the public at large is interested in its passage.

Yours respectfully,

George B. Post, Chairman.
Bruce Price.
Alfred Stone.
Robert Stead.
James G. Hill.

John M. Carrere, Secretary, 44 Broadway, New York.

Note.—As prompt action in this matter is of the greatest importance, I appeal to you for immediate support, and request that you send your contribution to me at your earliest convenience, should you care to help this cause.

.....Address.

To Mr.....

UNIVERSITY OF CALIFORNIA.

REGENT REINSTEIN'S VIEW AS TO ITS ARCHITECTURAL FUTURE.

The following resolution was adopted by the Regents at their meeting of April twenty-ninth, upon motion of Regent Reinstein:

Resolved—That the Committee on Buildings and Grounds be instructed to confer with Mr. Maybeck, Teacher of Architectural Drawing in the University, together with the President of the University and the Academic Council, to immediately prepare a program to be reported to the Board of Regents "for a permanent and comprehensive plan, to be opened to general competition, for a system of buildings to be erected upon the grounds of the University of California at Berkeley."

In advocating this motion Mr. Reinstein advanced many logical arguments which we are sorry not to be able to quote in full; but we give below some of the most important points in his address:

Gentlemen: Before discussing the subject-matter of this special meeting, namely, the obtainment of a permanent and grand plan for the grounds and buildings of the University of California at Berkeley, I desire to explain, for the benefit of those who may not know the facts in this behalf, that the idea of getting such a plan is neither original with me nor new with this Board. Mr. B. R. Maybeck, teacher of Architectural Drawing in the University, first suggested the matter to me, and I am well aware that this subject has had much thought and attention for many years past from almost every member of the Board, and I desire to state further, that unfortunately I have been unable to give to this subject the amount of attention its importance deserves. That importance has appealed to me with perhaps special force because of my membership on the Committee of Grounds and Buildings of the University, and perhaps also (by reason of the short time I have held the office of Regent), because of my ignorance of the importance of many other subjects which have occupied your time and attention.

In the determination of this question, three factors seem to me guiding and controlling.

First, is the need one which falls within the line of the purposes of the University?

Second, is the time ripe for such need to be answered?

Third, are the means at hand or available to satisfy such need?

And looking at the subject matter of this special meeting with admittedly inexperienced eyes, and having devoted to it far less thought than it deserves, and fully appreciating my ignorance of many other demands of the University, I nevertheless cannot help thinking that the obtainment of a comprehensive, permanent and grand plan for the grounds and buildings of the University of California is at the present time, the need most imminent of all others in point of time, the need most important as a University purpose, and the need, for the accomplishment of which, funds would be most available.

I need hardly say that my own opinion is not without authority and corroboration.

Regarding the subject matter of this special meeting, as I have done from the time it was first mentioned to me in November last, as one of commanding importance, I have communicated with the Presidents of the great Universities and the leading architects of this country, requesting their opinion of the desirability and the importance and the best methods of obtainment of beautiful grounds for the University, and buildings thereon, which should be not only convenient for use but architecturally beautiful in themselves, and parts of a grand, harmonious unity which should contemplate on what is conceded to be the *most beautiful site on this earth, the most glorious architectural pile of history*.

Every person to whom I have written on this subject has answered at length, and with far more interest and enthusiasm than might have been expected from those far removed from us by distance, and it is these opinions, with some of my own views thereon, I beg now to lay before you.

* * * * * *

The present buildings, few in number, and almost all of them admittedly temporary in character, now constitute something of an obstacle to the obtainment of such a plan, but each new permanent building placed upon those grounds will vastly increase and emphasize that obstacle. Those which are there now may be left until they have outlived their usefulness, without seriously impairing the permanent and grand and harmonious structures which are contemplated, but any further additions to such buildings made without regard to such permanent plan would certainly interfere most seriously with our purpose in that direction.

If it be conceded, as I think it will be, without doubt, that the present buildings will not conform to any such purpose as we have in view, and the necessities of the situation demand that the next Legislative appropriation shall be applied to the building of two or three more structures upon that ground, we shall be met again with the same difficulties we have experienced in the buildings for the affiliated colleges; we shall be compelled to advertise for plans; a number of architects (probably most, if not all of them from the Pacific Coast) will compete, and we probably shall have to select three separate plans for three separate buildings. All of these structures will probably be at variance with each other, and with all that has gone before or is expected to come hereafter and will make the present confusion worse confounded, to be emphasized and intensified, when a few years from now, a similar performance will make the present unfortunate condition disgraceful both to the University and the State, and preclude forever the possibility of architectural results at the State University worthy of either a sovereign State or of its highest educational institution.

Our whole method, in the past, of building hap-hazard, has been wrong, and it is high time that we should first lay out our plan for the *whole* University, and then build, forever after, in reasonable accordance with such plan. We have been building at the University just as one would, who built, separately, the various rooms of a house, before having a plan for the entire structure.

The older institutions of learning suffer the most perhaps from this unfortunate condition, and the letters from the Presidents of every old and great University in the land deplore this unfortunate condition in the matter of their University buildings.

Coming now to the proposition that a plan for glorious buildings and beautiful grounds will be a means of benefiting the University financially, first, by appropriations from the Legislature, and secondly by private endowments, it would seem to require no argument that the representatives of the people in the Legislature will be far more apt to give us moneys for buildings when we can show them exactly the purpose for which the money is to be definitely put, and much more apt to give liberally when they can see that the buildings to be erected will reflect credit, honor and glory on the State, and even on the nation.

The people of this State, like those of France, have a just and great pride in their State, a pride which is destined to grow and increase and intensify as the State becomes more populous and better known, and that pride has begun to be manifested in the architecture of our public buildings. In every town and city the city hall, the courthouse, the public library, as the Capitol of the State bear witness to this feeling, and in a sovereign State the buildings which subserve the highest and most important purposes of the State should yield to none in grandeur and beauty, and if we but plan wisely the representatives of the people will be both proud and glad to give lavishly to carry out the plan.

Moreover, such a plan and a few buildings erected in accordance with it, will stimulate private endowment for its speedy completion.

Private individuals will give gladly and freely to perpetuate their names in buildings which are to be parts of a superb architectnral pile *that will excite the admiration of the world*, while they will do nothing if the buildings which are to bear their names are hidden among a lot of others of every conceivable variety of insult to beauty and use, making a hodge-podge which can excite only the pity and criticism of every on-looker.

It is needless to say that all architects agree on the desirability and importance of beautiful grounds and buildings, arranged according to a general plan.

Upon the best method of obtaining such a plan, the leading architects of the country differ most widely. The correspondence received in that regard is however so voluminous that I shall not attempt to present anything more than the points made for the positions taken by such architects. Generally speaking it may be said that all the leading architects are opposed to what is termed an open or general competition and their views are fairly summed up in a pamphlet on the general subject of architectural competitions, written by John M. Carrere of the firm of Carrere & Hastings, concededly among the first of the architects of this country. I quote from said pamphlet the following:

"Architectural competitions, in the judgment of most architects, are 'a delusion and a snare.' The principal of bringing men into rivalry in the solution of the same problem with the hope of producing the best possible work, seems to be a correct one, but even disregarding all other practical reasons, it fails to produce the desired results, because, in the manner of presenting the solution—namely, by drawings—it is impossible, no matter how fully the drawings illustrate the idea, to give a complete conception of the work as it will appear. This would be true even if the judges who select this work were always as able as those who are competing. There is no doubt that in architecture, as in all other liberal arts and professions, the best results are generally obtained by selecting a man on his record for what he has actually accomplished, and entrusting the work to him without competition.

"A competition may result in bringing out hidden talent and give new men opportunities which they would not otherwise secure, but the older men who have their legitimate work to attend to which cannot be neglected, cannot be drawn into competitions for the mere sake of a chance to increase their practice, perhaps at the risk of unfair treatment or prejudiced decisions, and of unreasonable demands upon their time so that it is very seldom that the best men will consent to enter into competition, and the object of the same is thereby immediately defeated. * * * If competitions are to be a success, they should, in the first place, in my opinion, be made such as to commend themselves to the attention of the *entire profession*. The men with established reputations will not look upon competitions favorably, and will not take part in them regularly until a regular schedule has been established making uniform charges for competition drawings in the same manner as for other professional service. * * In the matter of public buildings it is somewhat different, from the fact that the character of the building is one which not only promises *renown* and *honor* resulting from possible success, but which gives the true architect the only opportunity for studying and designing *monumental* art; and for the sake of this *opportunity*, if the competition is properly conducted, the leading architects of this country would probably consent to compete."

These views of Mr. Carrere on the general subject of architectural competition fairly reflect those of the leading architects of this country, and without taking up the time of the members of this Board to quote extracts from the many letters received from such leading architects indicatcating their views upon the subject, I beg to be permitted briefly to epitomize what in my opinion is a fair statement of their position.

First—All of these architects seem to agree upon the proposition that the best plan would be for the Board of Regents to select some prominent architect to work in conjunction with a landscape engineer in the carrying out of our purposes. This idea seems impracticable: first, because of the difficulties in our selection of such an architect, and secondly because we are prohibited from such a course, apparently by the letter, and certainly by the spirit of the laws of this State for the erection of its public buildings.

Second. The plan next favored by leading architects is a competition limited to perhaps ten architects, and in their view the fewer the better, who should be paid for their services in rendering to us plans from which this Board in conjunction with an advisory Board of architects, elected by the competing architects, should choose some plan. As a modification of this idea, many of the architects have suggested that we might have in addition to the plans so furnished us by these ten leading architects, a public competition open to all other architects.

Third, and apparently as their last choice, these architects have suggested an unrestricted, open public competition.

It would seem that under the law only this last method can be adopted by us, and an instinctive feeling of what is fair would recommend this last plan above all the others under the circumstances in which we are situated.

Underlying the feeling on the part of all the great architects that we shall get the poorest results from a general competition, are two factors. First, as such architects are now constantly and lucratively employed, the most eminent architects will not go into such a competition where they claim that the chance of payment for their services and expense is a mere gamble. Secondly, they fear that in such a competition the decision will not be wise or not be just.

We must meet the great architects fairly on both these points. In order to succeed we must arrange some method to secure their services with a practical guaranty of payment to them for such services, and we must safe-guard the decision.

These conditions should be thoroughly recognized by us as essential, if not vital to successful results in any competition.

For these reasons I would suggest an international open double competition; that is, a preliminary, and then a final one. At the preliminary competition the architects competing would present simply a broad general idea or outline of their scheme, with but few and simple drawings.

The competing architects should elect an Advisory Board of five architects, one *each* from England, France and Germany, one from California and one from the balance of the United States.

This Advisory Board of architects, in conjunction with the Board of Regents, should select from the plans submitted at the preliminary competition, a number not less than five nor more than fifteen, among the authors of which there should be distributed equally $5000, and the authors of such selected plans be requested to enter a final competition, wherein their plans and ideas should be amplified and put in greater detail and clearness. As so large a number of plans would thus receive some compensation and the drawings required be but few and simple, each great architect would have a reasonable assurance of some reward for his time and thought thus devoted.

From the plans submitted at the final competition, the Advisory Board of Architects would then select a number of plans, not to exceed five, the author of the first and winning plan to have the construction of all buildings erected within say, twenty-five years and pursuant to his plans, and the authors of the remaining selected plans to have distributed among them $5000.

All the competing plans to be designated only by motto or device, a duplicate of which, together with the name and address of the architect adopting it, to be sent to the President of the United States to be disclosed only *after* the *final* award was made.

We believe that such a course would satisfy every architect of the country in the matter of its absolute justice.

INSULATION.

NEARLY a million dollars loss has been sustained in this city alone, in the past two years, by fires caused by the poor insulation of electric wires. To avoid the possibility of a fire happening from such a cause the installing of the wires in the new Parrott Building has been made with exceptional care. The highest grade of insulated wires was used and these wires were conducted to every part of the building through conduits, which received at least two coats of P. & B. Insulating Paint and a course of the heaviest grade of P. & B. Insulating Paper. Nearly one thousand gallons of the paint and some five thousand square feet of the paper were used. This paint was originated by the Paraffine Paint Co. of San Francisco and is now used in all parts of the civilized world. Like all other articles of merit it has been extensively imitated by unscrupulous parties.

SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE Chapter held its usual monthly meeting this month and elected to active membership Mr. R. H. White. The report of the Committee appointed at a previous meeting to formulate a scheme, etc., in reference to the best method of obtaining competitive designs for the State University, reported the result of its deliberations which were formally approved by the Chapter.

Following is the report in question:

SAN FRANCISCO, April 20, 1896.

J. B. Reinstein, Esq.

DEAR SIR:—Your communication of March 14th, in reference to the best method of obtaining competitive designs for the State University, was laid before the San Francisco Chapter of the American Institute of Architects at their last meeting, and was referred to a committee consisting of Seth Babson, President of the Chapter, Albert Pissis and G. W. Percy, to formulate and express the views of the Chapter in regard to the matter.

Acting under the instructions received, we would say: The Architects of California and the people of artistic taste having in mind the influence of such a centre of learning, agree with you that the time has come for adopting a complete, harmonious and effective scheme for the buildings and grounds of the University at Berkeley.

While in general we do not approve of competitions for architectural work, probably nothing else will be satisfactory to the majority of those interested.

We think that the general plan suggested by yourself is a good one, especially in having an advisory committee of experts selected from the best talent in the Country.

We would make the following suggestions as worthy of consideration:

The present buildings being for the most part inferior to the standard that will be required in the future, they having been erected without any regard to a general plan, and not being harmonious as to their style and location, they should be considered as merely temporary buildings, so as not to interfere with the general proposed scheme.

That an architect to carry out a general plan and arrangements should be selected after two competitive trials.

The first to be open to all, and should consist of preliminary sketches so as not to entail too much labor or expense on the part of the competing architects. Each competitor to be furnished with sufficient data, setting forth existing conditions and a carefully arranged programme prepared by the Regents, stating the accomodations required, also the number of drawings, scale, manner of rendering.

To these drawings may be added a description and explanation. Each design and description to be accompanied with a sealed envelope containing the name and address of the author and each marked with a motto or other device. From the preliminary plans thus submitted, the Board of Regents, with the assistance of their advisory committee, should select a certain limited number of the most satisfactory designs, and number to be determined at the time of calling for competitive plans. The authors of these designs to be invited to make a more complete study of the subject which shall include such drawings, descriptions and explanations as shall be deemed necessary for a proper and sufficient exposition of the design. The scale and number of such drawings to be determined by the Board of Regents, and set forth in the original invitation for the competitions.

Each architect invited for the second competition, should receive a certain sum as compensation for his work. Their designs should be carefully examined by the Board of Regents, and a report made on them by the advisory committee. From these, three designs should be selected and awarded three prizes consisting of a money consideration and in proportion as they are ranked. In addition, the architect whose design is classed first, should be employed at the usual compensation for all buildings erected during his active practice unless found unworthy of such a trust.

All designs except the one accepted should be returned to their authors, and no suggestions should be taken from them without the consent of the authors.

Respectfully submitted,

SETH BABSON,
ALBERT PISSIS,
G. W. PERCY.

BOOKS AND PERIODICALS.

SPECIFICATIONS—A practical system for writing specifications for buildings by W. Frank Bower, New York, Edward A. MacLean, 14 Lafayette Place, publishers. This work cannot fail to be of great service to the architect as an aid in making out specifications; the thorough manner the work has been compiled leaves no excuse for the architect to leave out anything that should go in, as nothing appears to be overlooked.

The author in the preface says:—"I would not wish to be understood as recommending all the methods of construction described—many have been inserted solely because they are in use in some localities neither do I make any particular claim to originality in the matter contained. Material has been collected from many sources, but I entertain the hope that I have, perhaps, compiled a work which will make specification writing more sure and systematic and less arduous."

THE PLANNING AND CONSTRUCTION OF AMERICAN THEATRES, by William H. Birkmire author of "Architectural Iron and Steel," "Skeleton Construction in Buildings," etc., etc., fully illustrated, published by John Wiley & Sons, New York, London, Chapman and Hall, 1896. The preface of this volume fully explains the reason for publication as follows:—

"Theatres, opera houses and public halls among the cities of this country have become so numerous, the planning and construction so governed by stringent building laws enacted and revised from time to time for the safety of the public, that the author has been induced to prepare this volume for architects and others interested in this class o structures.

In the preparation of the work the writer is under obligations and here makes his acknowledgments to well known architects who have made the subject a special study and

from their latest examples of modern theatres the illustrations have been made."

The book is printed on fine heavy paper and fully illustrated and certainly does credit to the publishers and will be found a welcome addition to any architects library.

The FORTHNIGHTLY contains useful articles on contemporary and live subjects one by Oliver Schreiner gives a thorough history and account of the original and non-progress of the unsophisticated Boers—a race dropped out of the seventeenth century into the nineteenth—and which the modern is doing his best to make conform to modern usages and manners; the other by "Ouida" in her usual sympathetic manner congratulating the Italians on their stand against being sent to Abyssinia to be murdered for the benefit of army contractors and money lenders.

Mr. Sidney Buxton's Reminiscence of Cardinal Manning in his connection with the Dock strike in London a few years ago show the Cardinal up in his best light and shows that in his old age after an experience of over eighty years he became practically a Socialist, is shown by the following letter:

Archbishop's House, Westminster,
Dec 27, 1889.

My dear Mr. Buxton:—"I have been laid up for a fortnight. Six hours in the Egyptian Hall gave me a chill. But I have been turning over the Strike matters, and the the more I think, the more I am on the side of labour.

"1. Labour and skill are capital, as much as gold and silver.

"2. Labour and skill can produce without gold or silver.

"3. Gold and silver are dependent on labour and skill, but labor and skill are independent *in limine*.

"4. The union of the two Capitals demands participation in the product.

"5. Wages are a minimized money representation of shares in product, that is in profits.

"6. Silvertown gives 15 per cent to its shareholders, and denies half-pence and farthings to its workers.

"7. This is more or less the state of the labour market at large.

"8. No strike is worth making except for a twofold share in the profits of a twofold capital. But individualism, selfishness, freedom of contract, and competition have obliterated the first principles of the Metayer system.

"I could not write without saying this, but it would be Evangelium Dæmoniacum. My hope is that the permanent Body of Reference and the subordinate Committees will force a thorough sifting of the whole question. So long as our workingmen men live in rooms not fit for human habitation, neither they nor theirs can live a human life.

"I want a great deal more than better wages.

"Many happy New Years to you.

Very truly yours,
Henry E. Card, Archbp."

In another letter, dated January 21st, 1890, he writes, in the bitterness of his heart:—

". . . a clergyman said last week, 'The Dockers' Strike succeeded because the police did not do their duty; the Gas Strike has failed because the police did their duty.'

"The 'freedom of contract' is maintained by the truncheon.

"There is no justice, mercy, or compassion in the Plutocracy.

"There is my creed, and I hope to write it in this year. . ."

Most people lay these opinions to his wise benevolence—the present Cardinal Vaughn lays it to his dotage. Take your choice.

THE PUBLIC ART LEAGUE OF THE UNITED STATES.

CONSTITUTION, LIST OF OFFICERS AND ORGANIZERS.

Article 1. Name—the name of this Society shall be "The Public Art League of the United States."

Article 2. Object—The object of this League is to promote the passage of a law or laws by Congress requiring that before purchase or adoption by the Government of any work of Art, (Sculpture, Painting, Architecture, Landscape design, Coin, Seal, Medal, Note, Stamp, or Bond,) the design or model for the same shall be submitted, to a commission of experts for an expression of opinion as to its artistic merit, and that the approval of such committee shall be a prerequisite to its adoption.

Article 3. Means—The means of accomplishing the object of the League shall be a persistent agitation of the subject before Congress, and the promotion of agencies for the education of the masses of the people.

Article 4. Membership—Persons interested in the objects of the League may become members by authorizing the Secretary to sign their name to the Constitution.

Article 5. Officers—The officers of the League shall be a President and three Vice-Presidents, a Recording and Corresponding Secretary, and a Treasurer, each of whom will serve two years. There shall be twenty-four Directors, six of whom shall retire each year. The Officers and Directors shall nominate three persons for each vacancy that may occur, and from among these nominees one person shall be elected to fill each vacancy by the majority of the votes cast in a letter ballot in which all members of the League may participate.

Article 6. Management—The officers, with the Directors, shall constitute a Board of Managers, who shall have the direction of the affairs of the League and make by-laws for its government. All questions to be brought before the Society must first be submitted to the Board of Managers.

Article 7. Fees—The membership fee shall be one dollar per year.

Article 8. Changes—This Constitution shall not be changed, except upon the recommendation of a two-thirds vote of the Board of Management, and a letter ballot, showing a majority of the League in favor of such change.

LIST OF OFFICERS AND DIRECTORS FOR "THE PUBLIC ART LEAGUE." 1896 AND 1897.

Richard Watson Gilder, Editor *Century Magazine*, N. Y., President. *Richard M. Hunt, Architect, N. Y., 1st Vice-President. Augustus St. Gaudens, Sculptor, N. Y., 2d Vice-President. John La Farge, Artist, N. Y., 3d Vice-President. T. M. Clark, Architect, *American Architect*, Boston, Mass., Recording Secretary. Glenn Brown, Architect, 918 F. street, Washington, D. C., Acting Corresponding Sec'y.

* Deceased. Vacancy to be filled by election under the Constitution.

EMPORIUM BUILDING.

In our last number we gave some illustrations of the exterior and interior of the Emporium Building. In this number we illustrate some of the interior fixtures for the departments of the store.

The San Francisco Furniture Manufacturing Co. made the major part of the fixtures including the fixtures of the Art, Crockery, Clothing and Furniture Departments and the counters and shelves around the Central Cafe under the Rotunda.

They are all constructed in the best methods of joinery of California woods, viz.: California Maple, Spruce, Redwood, Oak and Ash. The only foreign wood employed is Mahogany of which most of the fixtures of the first floor are composed. They are all made from orignal designs by the architects, Pissis & Moore, who in consequence of their complete drawings and details avoided any mistakes or delay in the work.

These fixtures are spread over three floors of this immense building and consist of glass cases, pyramid cases and tables, ordinary tables, shelving, etc. The columns throughout are utilized to advantage by being made the centre around which are placed circular shelving and tables. Besides this the San Francisco Furniture Manufacturing Co. made all the telephone boxes, and dressing boxes for the Tailoring Department and the finish of the Barbers' Shops and Ladies' Waiting Room, the latter in the Grecian style.

The good workmanship of and the short time in which these miles of shelving and thousands of drawers were done demonstrates conclusively that owners and dealers need no more send outside of this State for their furniture or any other work of this description as the San Francisco Furniture Manufacturing Co. challenge any firm in the East to get out any work so good or in such short a time as the work here under consideration.

This firm being established twenty-five years in Chicago has only just moved to San Francisco and therefore the expedition with which this work was done is the more remarkable.

The work done in California Oak in this building will remove the prejudice against that wood so far exhibited. There is no doubt that there is only one Oak that can compare at all with its beauty and that is the English Oak. The cost of that precludes any use of it on this Coast—especially when equally as good can be found in the mountains of Humboldt, Del Norte and other counties of California—as well as Oregon.

When properly kiln dried no fear need be had of its warping or shrinking and we believe that henceforth the days of imported hardwood work are now numbered; as after the demonstration given no excuse can be found henceforth for paying heavy freights which can do no good whatever to this coast. Another advantage of the California Oak is the great length in which it can be obtained—planks forty to sixty feet being obtainable while sixteen feet is the longest piece that can be obtained in the East.

The beauty of the California Maple and Ash likewise cannot be beat in the world and now that the San Francisco Furniture Manufacturing Company has led the way, there is nothing to prevent us not only manufacturing our own furniture here of our own woods but exporting the same to our Eastern neighbors.

THE MORGAN HEATING AND VENTILATING SYSTEM AS USED IN THE MARSHFIELD SCHOOL HOUSE, MARSHFIELD, OR.

In the centre portion is the fuel and furnace room where Walter Morgan & Co. have installed their system of heating and ventilation, which consists of chambers for collecting the fresh air from different sides of the building, then passing same over the surface of large heaters and distributing it to various parts of the building through metallic ducts; in each class room is a patent device for regulating the flow of warm and cool air, so that the temperature can be raised or lowered at the option of the teachers. Along side of each furnace in the basement is an immense flue for ventilation, having a specially designed stove heater to generate heat, and thereby create a power to exhaust the foul air through the various foul air ducts from each room at the floor line.

A TEST OF THE SYSTEM.

A severe test of this system was made during that afternoon by the Board of Directors, which demonstrated the fact that the air in each class room can be changed every ten minutes, thus giving nearly two thousand cubic feet of fresh air each hour to every child without opening a single window or door.

During the summer months it will only be necessary to keep a little fire in the small heaters in order to maintain a perfect system of ventilation.

This system of heating and ventilation is well adapted for schools and other public buildings, being simple in construction, easy to manage and gives good results for a very small consumption of fuel.

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.
Seth Babson, Pres. W. P. Moore, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Southern California Chapter American Institute of Architects, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
Octavius Morgan, Pres. A. M. Edelman, Vice-Pres.
Arthur B. Benton, Sec't. August Wackerbarth, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.
Geo. W. Dickie, Pres. W. G. Curtis, Vice-Pres.
Otto Von Geldern, Sec. Edward T. Schild, Treas.

Master Plumbers' Association, meets every first and third Friday of each month at the Flood Building.
Jas. E. Britt, Pres. J. L. E. Firman, Sec.

Builders' Exchange, Directors meet first Friday in each month at Mission and New Montgomery.
Oscar Lewis, Pres. Jas. A. Wilson, Sec.

Masons' and Builders' Association, meet first Friday evening of each month.
Adam Beck, Pres. M. V. Brady, Sec.

BUSINESS MOSAICS.

The immense amount of damage that is often done by water is clearly illustrated at the recent fire at Ames & Harris' establishment at the corner of Drumm and Sacramento streets. Much of the loss could have been avoided by the use of a course of P. & B. Waterproof Building Paper between the floors. The cost of such a waterproof course amounts to nothing compared to the protection against damage afforded by it.

Visitor—Oh yes, Miss Vantyred, I assure you that while I was on the other side I was considered quite a lion! MISS VANTYRED—The king of beasts?—*Truth.*

With the coming of each and every spring, editors and publishers are offered "Spring Poetry," which is considered by the authors, of a quality quite equal, if not superior, to anything ever launched upon the poetry-loving world. As with poetry, so it is with paint,—as the spring season of painting and repainting comes along there is sure to be offered something new in the way of paint mixture for the protection of roofs, iron work, etc. Fortunately the public, as a rule, discriminate as wisely against such new nostrums as it does in its poetry, and rightly chooses a paint like Dixon's Silica Graphite Paint, which has been so favorably known for over a quarter of a century.

Roofs painted with Dixon's "Silica Graphite" Paint have not required repainting in twelve to fifteen years and over. Railway and other corporations known for their thorough testing and careful selection of materials, use this paint in large quantities. Anyone desiring to know more about Graphite Paint should address the Joseph Dixon Crucible Company, Jersey City, N. J.

Teacher—Now, my boy, tell me what animals are best protected by Nature from the ravages of winter? MY BOY—Those that live on the line of the Equator, sir!—*Puck.*

The heading of this page reminds one to mention the fact that mosaic work is now quite generally used not only in small patches as formerly but now in extensive amounts, witness the floor of the Emporium Building.

W. W. Montague & Co., the layer of this floor has gone into this business with the same vim as they have into the eucaustic tiling, mantels, heating and other branches of their extensive establishment, and have made the same success of it.

Charlie—Miss Flyppe's stockings are extensively clocked. JACK—Yes. They're extensively watched, too.—*Truth.*

Since the establishment of the J. L. Mott Iron Works in 1828, there has never been a time when that company could make such a fine display of goods as at present. Something new all the time appears to be their motto; now we have the hinged drain board for the kitchen sink which marks another advance in sanitary science. You have only to inspect the cut upon page v of this journal to be convinced of the utility of this new departure from the old style of doing things. Mr. M. S. James, Pacific Coast Representative of the company can be found in the handsome sale room 27 Flood Building, San Francisco, Cal.

He—I don't like the man. He called me an ass once! What do you think of that? SHE—I think his politeness does not compare with his knowledge of natural history.—*Truth.*

Samuel Cabot, 70 Kilby street, Boston, Mass., appears to have solved the question of "Sound-proof Construction" by means of Cabot's Deafening Quilt, all this is explained in a little leaflet, published at the above address. It will surprise the reader to find out how much can be said, and well said, in such a small space.

The cabin boy was in the habit of eating his loaf-bread and leaving the crusts. MATE—We ate our crusts here, laddie. BOY—Weel, I'm leavin' them tae ye.—*Dundee News.*

Samuel Kellett, manufacturer of Plaster Decorations will be found at the old stand, 28 Ellis street, San Francisco, with branch office at 375 Twelfth street, Oakland, plastering repaired and whitening.

"How do you keep your collars so bright and clean these dusty days? "They're made of celluloid, and I polish them up with tooth-powder twice a day."—*Judge.*

At the rate Mr. George Goodman is using up cement, one would be inclined to think the market would run short of this article, but we suppose Grace & Co. will tell us there is no danger of this though 20,000 bbls. may be used on one job. If you want a cement sidewalk call upon Mr. Goodman at 307 Montgomery street, Nevada Block, San Francisco.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

WHEN BUILDER CANNOT COLLECT FOR PREPARING PLANS.—Where a contract for a fixed amount is entered into between the owner of property and a builder, according to certain specifications, to which a plan is annexed, as explanatory of same, in the absence of an agreement for it, no charge can be made as for extra services in the preparation of the plan. The builder appears in such transaction, not as an architect, but as a contractor.

Haas v. Hernandez, Supreme Ct. La., 19 Southern Reporter, 269.

WHAT MUST BE SHOWN AS TO EXTRA WORK.—A builder claiming remuneration, over and above the contract price of a building, for certain labor and material, as having been finished for extra work, must establish with reasonable certainty that they were used for that particular purpose.

Hass v. Hernandez, Supreme Ct. La., 19 Southern Reporter, 270.

LIABILITY OF OWNER AND GRANTEES UNDER PARTY-WALL AGREEMENT.—A party-wall contract between O. and K. provided that K., his heirs and assigns, should pay O. one-half the value of such wall when he, or his heirs or assigns, used the same, or for as much as he used of it. The contract was duly acknowledged and recorded. After O. built the wall, K. conveyed his lot by general warranty deed, and from his grantee title was deraigned, by successive general warranty deeds, by D. and S. who appropriated and used the wall. The Court held that, K. was primarily and personally liable to O's. successor in title for one-half the value of such wall, and that K's successive grantees were liable in the inverse order of their deeds.

The fact that such agreement was indexed as a deed, instead of a mortgage, did not affect the question of notice by record.

Knowles v. Ott, Ct. Civ. App. Tex., 34 S. W. Reporter, 295.

INADEQUACY OF CONSIDERATION OF FORECLOSURE SALE.—The Supreme Court of Ohio holds that, where property valued at about forty thousand dollars was sold on execution in a suit to foreclose a mechanic's lien, for nominally two hundred and fifty dollars, but the purchaser was a trustee representing lien claimants whose demands aggregate eleven thousand dollars, and who are equally benefited by the sale, the price cannot be considered grossly inadequate, so as to warrant a vacation of the sale.

Hardware Company v. Cleveland Building Company, 32 S. W. Rep. 1.

MECHANICS LIEN: WHEN CONTRACTOR CANNOT PRODUCE CONTRACT.—A mechanics' lien will not be defeated by the failure of the contractor to register the written contract, when that is required by the law, when such failure is caused by the fact that the written contract is in the possession of the owner of the building, and the latter refused upon demand to surrender it for registration.

Strang v. Pray, Ct. Civ. App. Tex., 34 S. W. Reporter, 666.

ARCHITECT NOT LIMITED BY WORK DONE UP TO TIME OF DISCHARGE.—Under a contract with an architect to furnish the necessary drawings, specifications, and details for the construction of a building for a certain percentage on the total cost of the construction of the building, the architect after furnishing the drawings, etc., is not limited, in case his employment is terminated before the construction of the building is completed, to a recovery of the percentage on the costs of the building so far as it was completed at the time of his discharge.

Havens v. Donohue, Supreme Ct. Cal., 43 Pacific Reporter, 962.

CITY BUILDING NEWS.

Army near Sanchez. Two-story frame except plumbing, etc.; owner, Rober; W. Leslie; architect, C. M. Rosseau; contractors, Westerlund & Sandeent signed, April 8, filed, April 9; cost $2540.

Baker near McAllister. To build; owner, Owen McHugh; architect, C. J. I. Devlin; contractor, F. W. Knight; signed, April 11; filed, April 16; cost $3232.

Battery and Bush. Brickwork, etc., for six-story brick; owners, Isabella D., Alice Ann, Mary E. and Grace E. Clark, by attorney; architect, Edward R. Swain; contractor, O. E. Brady; signed, March 11; filed, April 23; cost $32,974. Carpentry, etc., contractor, T. M. McLachlan; signed, April 6; filed, April 23; cost $10,144. Excavations, etc.; contractor, J. A. McMahon; signed, March 11; filed, April 23; cost $7175. Cast iron work; contractors, O'Connell & Lewis; signed, April 6; filed, April 23; cost $10,900. Wrought iron work; contractor, Ralston Iron Works; signed, April 6; filed, April 23; cost $5420. Plumbing; contractor, W. Wilson; signed, April 6; filed, April 23; cost $1890. Plastering, etc.; contractor, M. Carrick; signed, April 6; filed, April 23; cost $2846. Painting, etc.; contractor, J. H. Keefe; signed, April 6; filed, April 23; cost $845. Roofing, etc.; contractors, Conlin & Roberts; signed, April 6; filed, April 23; cost $760.

Belvedere near Waller. To build; owner, Blanch E. McGivern; architect, John McHenry; contractors, W. H. & T. Kinread, signed, April 24; filed, April 25; cost $3775.

Broadway near Buchahan. Two-story frame; owner, Edward Salz; architect, J. E. Kraft; contractor, Jas. Kemp; signed, April 23; filed, April 27; cost $5760.

Brunswick near Lowell. Two-story frame; owner, Chas. Serveau; architect, F. Diepierre; contractors, J. L. Binet and Ed. Mooney; signed, April 16; filed, April 18; cost $1296.

Bush near Broderick. Alterations and additions; owner, Mrs. C. Meyers; architect, G. Scheadler; contractor, Geo. Lack; signed, April 20; filed, April 21; cost $1500.

Bush and Taylor. Out-buildings, etc.; owner, Board of Education; architect, C. I. Havens; contractor, J. H. McKay; signed, April 18; filed, May 1; cost $1900.

Buchanan near O'Farrell. Three-story frame except plumbing; owner, Pierre Bellue; architect, Oliver Everett; contractor, James Cochrau; signed, April 16; filed, April 17; cost $8524.

California and 12th Ave. Cottage; owner, Jas. Eisen; contractor, A. Aldridge; cost $2000.

California near Scott. Mason work, additions and repairs; owner, Mrs. Hattie H. Rehfish; architect, J. H. Littlefield; contractor, H. H. Larsen; mason work; cost $517. Plastering, etc.; contractor, J. R. Tobin; cost $976. Painting; contractor, W. T. Beck; cost $871. Plumbing; contractor, H. Williamson; cost $442. Mantels, tiles, etc.; contractors, W. W. Montague & Co.; cost $525.

Carlos near O'Farrell. Excavations, concrete, six-story brick building; owner, J. Frowenfelt; architects, Salfield & Kohlberg; contractors, Gray Bros.; signed, April 16; filed, April 16; cost $1450. Mason work; contractors, Miller & Beck; cost $4735. Iron work; contractor, Western Iron Works; cost $800. Plumbing; contractor, Ickelheimer & Bros.; cost $3300. Lathing and plastering; contractor, W. C. Watson; cost $1290. Carpenter work, etc.; contractor, A. L. Bampbell; cost $5430.

Clement near 5th Ave. Two-story frame; owner, Ernest J. Uebner; architect, H. D. Mitchell; contractor, Ed. Ginley; signed, April 10; filed, April 10; cost $3150.

Clement near 31st Ave. To build; owner, Edward Philips; contractor, John Wickman; signed, April 15; filed, May 2; cost $1500.

Clayton near Waller. Two-story frame; owner and builder, Thomas Vodder; cost $4000.

Clayton near Waller. Two-story frame; owner, Julia Schroeder; architects, Hermann & Swain; contractors, Peterson & Person; signed, April 27; filed, April 27; cost $3944.

Devisadero and Ellis. Brick work, etc., for three two-story frames; owner, Hans J. H. Koepke; architect, Emil John; contractor, F. Wagner; signed, April 4; filed, April 9; cost $1497.

Devisadero and Ellis. Carpentry, painting; owner, Hans J. H. Koepke; architect, Emil John; contractor, C. Krecker; signed, April 4; filed, April 9; cost $8585.

Dore and Harrison. To build; owner, F. C. Howard; contractors, Cuneo & Cavaglia; signed, April 28; filed, May 1; cost $2200.

Dolores near 27th. Two-story frame; owner, Jacob Y. Jackson; contractor, James McComahey; signed, May 2; filed, May 2; cost $1850.

Diamond near 18th. Cottage; owner, Th. Binner; contractor, T. A. Bonn; signed, May 8; filed, May 8; cost $1600.

Ellis near Mason. Elevator work; owner, Jacob Frowenfelt; architects, Salfield & Kohlberg; contractor, W. L. Holman; signed, April 7; filed, April 20; cost $2850.

First Ave. near Clement. To build; owner, C. E. Baker; contractor, B. R. Van Deusen; signed, April 10; filed, April 11; cost $2600.

Folsom and 25th. To build; owner, Edward Gentry; architect, C. M. Rousseau; contractors, Williams & Foster; signed, April 9; filed, April 10; cost $3685.

Folsom and 25th. Plumbing and gas-fitting; owner, Edward Gentry; architect, C. M. Rosseau; contractors, Gulick & Wetherbeen; signed, April 10; filed, April 13; cost $1500.

Forth-fourth Ave. near Clement. To build; owner, Theresa Nelcke; architect, V. Knolow; contractor, G. P. Ralston; signed, April 9; filed, April 10; cost $1200.

Freelon near 8th. Two-story frame; owner, Hannah Murphy; contractor, A. Klahn; signed, April 16; filed, April 17; cost $2586.

Fulton near Fillmore. Two-story frame; owner, Harriett H. Moise; architect, W. H. Lillie; contractors, Petterson & Person; signed, April 16; filed, April 17; cost $1422.

Geary near [illegible]. Concrete wall; owner, P. W. Riordan, Archbishop; [illegible]ghnessy; cost twenty-seven cents per cubic foot.

Geary and [illegible]. Excavations for supporting wall; owner, Spring Valley Water Works; contractor, Clinton Day; contractor, James O'Brien; signed, April 30; filed, [illegible]; cost $500.

Georgia and Napa. Cemetery, painting, etc.; owner, Union Iron Works; architects, Percy & Hamilton; contractor, T. McLachlan; signed, April 17; filed, April 23; cost $[illegible]. Granite and mason work; contractors, McCall, Beck & Miller; cost $[illegible]. Plumbing; contractor, W. F. Wilson; cost $1643. Roofing, copper work; contractors, Goodlib & Roberts; cost $[illegible]. Concrete work; contractors [illegible], Leonard & Ransome; cost $7050.

Golden Gate Ave. and Larkin. To build; owner, Katherine Farrell; architects, Shea & Shea; contractors, Bateman Bros.; signed, May 1; filed, May 6; cost $2000.

Gough near California. Grading work; owner, Lewis Gerstle; architect, Clinton Day, contractor, C. A. Warren; signed, May 5; filed, May 8; cost $735.

Greenwich near Jones. Repairs for Cooper School; owner, Board of Education; architect, C. I. Havens; contractor, J. J. Dowling; signed, April 16; filed, May 1; cost $7997.

Guerrero near 16th. Additions; owner, Patrick Hackett; contractor, T. J. Gallehorn; signed, April 9; filed, April 10; cost $1562.

Guerrero near 17th. All work except plumbing and tinning; owner, Stephen Flahoven; contractor, R. Sinnott; signed, April 11; filed, April 11; cost $2540.

Howard near 12th. Additions; owner, C. E. Tosney; contractor, John Foster; signed, April 8; filed, April 10; cost $2175.

Jackson near Gough. Alterations; owner, A. de Uriostegarchitects, Pissis & Moore; contractor, E. J. Duffy; signed, April 16; filed, April 20; cost $1373.50.

Kentucky and Napa. To build; owner, Dr. E. L. Wemple; architect, Hugo W. Storch; contractor, Alfred Hawkins; signed, April 15; filed, April 16; cost $6800.

Kentucky and Napa. Plumbing, gas-fitting, etc.; owner, Dr. E. L. Wemple; architect, H. W. Storch; contractor, P. J. O'Donnell; signed, March 25; filed, April 27; cost $1900.

Kentucky and Sierra. Plastering, staff work, etc.; owner, Dr. E. L. Wemple; contractor, A. Matherson; signed, May 6; filed, May 7; cost $1088.

Locust near Clay. To build; owner, Mrs. Abbie Dyer; architect, Hubert Dyer; contractors, W. T. Veitch & Bros.; signed, April 11; filed, April 13; cost $2268.

Market and 3d. Granite work; owner, Claus Spreckels; architect, Reid Bros.; contractor, J. D. McGilvray; filed, April 24; cost $152,710. Cleaning and pointing stone and granite work; contractor, J. D. McGilvray; filed, April 24; cost $2000.

Market near Van Ness. Gas-fitting, plumbing, etc., for three-story brick; owner, J. H. Mangels; architect, R. Zimmerman; contractor, W. F. Wilson; signed, April 24; filed, April 25; cost $2,845

Market and Van Ness. Plastering work; architect, R. Zimmerman; contractor, M. Carrick; cost $2177.

Market near Van Ness. Brick building; owner, J. H. Mangels; architect, R. Zimmermann; contractors, Riley & Loane; signed, April 13; filed, April 15; cost $5196.75.

Market near Van Ness. Carpentry, marble work, etc.; owner, J. H. Mangels; architect, R. Zimmermann; contractor, F. W. Kern; signed, April 13; filed, April 15; cost $23,949.

Market and Front. Electric Elevator; owners, Agnes M. Agar, J. M. McDonough; contractors, A. J. McNicoll & Co.; signed, April 9; filed, April 10; cost $2600.

Market near 4th. Book-cases, cabinet work, etc.; owner, Mrs. A. M. Parrott; architect, Pissis & Moore; contractors, L. and E. Emanuel; signed, April 15; filed, April 22; cost $1135.

Main near Mission. Two-story brick; owner, John Cherry; architect, J. P. Brady; contractor, John Dunphy; signed, April 11; filed, April 16; cost $3895.

Moulton near Fillmore. Cottage; owners, Mr. and Mrs. Peter Magnussen architect, Emil John. contractors, Stevens & Wood; signed, April 22; filed, April 22; cost $980.

Mission Road near 29th. To build; owner, W. L. Tierney; contractor, W. C. Hamerton; cost $1400.

Oak near Octavia. Alterations and additions; owner, Mrs. B. McCarthy; architect, J. B. Lo Romer; contractor John Blake; signed, April 13; filed, April 14; cost $2300.

O'Farrell near Stockton. Painting, etc.; owner, Walter Orpheum Co.; contractor, H. M. Hesser; signed, April 22; filed, April 23; cost $1400.

Post and California. Plumbing, etc.; owner, W. B. Bradbury; architect, F. B. Wood; contractor, James Day & Co.; signed, April 16; filed, April 16; cost $1815.

Post near Taylor. Alterations and additions; owner, Mrs. Lizzie J. Hemphill; architects, McDougall & Son; contractor, Thomas Butler; signed, May 6; filed, May 6; cost $1920.

Ridley near Sanchez. Additions; owner, L. B. Schmid; cost $2000.

Sacramento and Webster. To build; owner, J. H. Jellett; architects, Salfield & Kohlberg; contractors, T. R. Bassett Bros.; signed, April 27; filed, April 30; cost $8000.

Sansome and Halleck. Piling, etc., for five-story brick and stone; owner, Jacob Stern; architects, Pissis & Moore; contractors, Healy, Tibbitts & Co.; signed, April 2; filed, April 9; cost $3880.

Sansome and Halleck. Sandstone work; owner, Jacob Stern; architects, Pissis & Moore; contractor, John McGilvray; signed, April 2; filed, April 9; cost $23,373.

Sansome and Halleck. Concrete and pavement; owner, Jacob Stern; architect, Pissis & Moore; contractor, Geo. Goodman; signed, April 2; filed, April 6; cost $5400.

Sansome and Halleck. Granite work: owner, Jacob Stern; architects, Pissis & Moore; contractor, Raymond Granite Co.; signed, April 2; filed, April 9; cost $2865.

Sansome and Halleck. Mason work; owner, Jacob Stern; architect, Pissis & Moore; contractors, Mill & Beck; signed, April 2; filed, April 9; cost $7545.

Sansome and Halleck. Cast iron work; owner, Jacob Stern; architects, Pisses & Moore; contractors, O'Connell & Lewis; signed, April 2; filed, April 9; cost $3400.

Sansome and Halleck. Carpenter work; owner, Jacob Stern; architects, Pissis & Moore; contractor, R. Smillie; signed, April 2; filed, April 9; cost $9095.

Scott near Fell. Additional story; owner, T. J. Allen; architect, T. J. Welsh; contractor, A. L. Campbell; signed, April 22; filed, April 27; cost $2491.

Scott near Grove. Two-story frame; owner, John J. Vollmer; architect, H. Geilfuss; contractors, Hood & Watson; signed, May 5; filed, May 7; cost $2489.

Sickels Ave. cor. Sears. Cottage; owner, Eugene H. and James J. Casserly; contractor, James McComahey; signed, April 18; filed, April 18; cost $1000.

Steiner near Broadway. Carpentry, plastering, etc.; owner, Mrs. E. Greenberg; architect, M. S. Lyon; contractor, J. T. W. Saunders; signed, April 8; filed, April 15; cost $3883.

Tenth Ave. near Clement. Cottage; owner, Catherine McFarland; cost $2600.

Tennessee near Sierra. Cottage; owners, John and Catherine Bowes; contractor, John Keneally; signed, April 29; filed, April 30; cost $1197.

Silver near 2d. Alterations; owner, Board of Education; architect, C. I. Havens; contractor, J. H. McKay; signed, April 18; filed, April 20; cost $3800.

Turk and Devisadero. Painting and graining five buildings; owner, Mrs. Caroline A. Bollman; architect, Wm. Koenig; signed, April 18; filed, April 30; cost $1107.

Twelfth Ave. near Lake. Cottage; owner, Mrs. Atkinson; contractor, L. T Fenn; cost $1500.

Twenty-first and York. To build except plumbing; owner, Elizabeth P. Sonntag; contractor, E. W. Hyde; signed, May 2; filed, May 2; cost $2200.

Twenty-first near Hampshire. To build; owner, F. W. Banks; architect, F. M. Cramer; contractor, W. R. Kenny; signed, April 27; filed, April 28; cost $1960.

Twenty-sixth and San Jose Ave. Alterations and additions; owner, Patrick Donellan; architect, J. T. Kidd; contractor, T. F. Doyle; signed, April 6; filed, April 16; cost $1075.

Twenty-ninth near Noe. Alterations; owner, William Inch and Mary Inch; contractor, John Dyar; signed, April 25; filed, April 27; cost $1000.

Union near Scott. To build; owner, Theresa A. F. Peters; architect, H. Geilfuss; contractor, C. Schutt; signed, May 1; filed, May 6; cost $3075.

Vllejo near Laguna. To build; owner, J. J. Boyle; architect, T. J. Welsh; contractor, Thomas F. Doyle; signed, April 8; filed, April 11; cost $4589.

Vallejo near Gough. To build; owner, Charles Meehan; architect, S. Newsom; contractor, W. H. Wickersham; signed, April 25; filed. April 29; cost $3392.

Valencia and 14th. To build; owner, H. T. Scott; architect, W. J. Mathews; contractor, J. A. Smillie; signed, April 13; filed April 20; cost $16,770.

Van Ness Ave. and Clay. Interior work and painting, etc.; owner, Claus Spreckels; architects, Reid Bros.; contractor, San Francisco Mnf. Co.; signed, April 23; filed, May 2; cost $5945.

Van Ness Ave. and Clay. Interior wood work; owner, Claus Speckels; architect, Reid Bros.; contractor, Hester Bros.; signed, April 17; filed, April 21; cost $46,200.

Van Ness Ave. near Golden Gate. Additions and alterations; owner, Geo. H. Goddard; architect, C. J. Coffey; contractors, R. A. Anderson & Co.; signed, April 28; filed, April 28; cost $1507.

Vermont near 23d. Cottage; owner, John F. Struven; architect, Emil John; contractor, H. Born; signed, April 18; filed April 20; cost $1967.

Waverley Place. Alterations and additions; owner, J. B. Stoupe; architect, C. M. Rosseau; contractors, Doyle & Son; signed, April 16; filed, April 18; cost $1700.

EXISTING POST-OFFICE BUILDING AT SAN FRANCISCO, CALIFORNIA.

PREMISES OF NEW SAN FRANCISCO POST-OFFICE, AUTHORIZED BY ACT OF CONGRESS, MARCH, 1887.

A MULTI-MILLIONAIRE is putting up a two hundred and fifty thousand dollar fence around his lot in Newport. The people's lot in San Francisco has a board fence around it, stuck over with advertising placards.

AT the last meeting of the San Francisco Chapter of the American Institute of Architects, the following communication was received from the District Council of of the United Brotherhood of Carpenters and Joiners of America:

SAN FRANCISCO, CAL., June 8, 1896.

Secretary Chapter of Architects.

DEAR SIR:—As the Council of Carpenters will not under

any circumstances work with Shinglers they have instructed me to inform you of the fact and suggest that you put in your specifications "no shingling to be let by piece work." We most earnestly request this as you can save trouble for us, yourselves and the owners. Hoping to hear from you soon, I remain yours,

R. B. Ingle, Secretary.

114 Turk street.

No action was taken by the Chapter other than to receive and file the letter.

This attempt on the part of one body of organized labor to antagonize another body of labor that seeks the advantages of organization on similar lines and for the same purposes, displays a selfish disregard of the rights of others that is not worthy of workingmen.

Until the laboring man and mechanic the world over learns that his interest is identical with the interests of every other workingman and mechanic, it will be in vain for him to hope to permanently better his economic condition through pure and simple "Trades Unionism." Until he learns that he cannot better his own condition without bettering the condition of all workers, and that the interests of the Union man are the same as the interests of the non-Union man, and *vice versa*, he will make no substantial progress towards ameliorating his condition.

It is lamentable to well-wishers of labor, to see this petty jealousy and perpetual bickering between workingmen. The carpenters will not recognize the shinglers; the cooks and waiters will not affiliate with the dish-washers and porters, and so it goes. Instead of uniting, and so obtaining the benefits of organized and concerted action towards a definite goal, the laboring classes remain disunited and unorganized, and consequently, impotent.

What a contrast is presented between this picture and that of the A. R. U. in their fight against the Pullman Company two years ago. In that fight the devotion to their principles of brotherhood was truly remarkable. They recognized the solidarity of the interests of the workingman, and to aid and assist their worthy but persecuted brothers, they did not hesitate at any sacrifice that men can be called on to make; and their deeds may well be chronicled as more heroic than many a noble action that history records, as a lingering death by misery and starvation is more dreadful than a sudden death on field of battle.

Should the time ever come when the spirit that animated the members of the A. R. U. shall govern the actions of the workingmen of America *as a class*, then, and not till then, can they compel the recognition they seek, and enforce such rules and regulations, laws and customs, as shall inure to their permanent betterment of their conditions and environments.

THE National Association of Manufacturers of America are agitating the formation of a separate department of the Government called a Department of Commerce and Manufactures.

The present arrangement of the department is entirely haphazard and unsystematic; witness the following table of the Bureaus of the State and Treasury Department:

State Department—Diplomatic Bureau, *Consular Bureau*, Bureau of Accounts, Bureau of Archives, *Bureau of Statistics*, Bureau of Rolls and Library.

Treasury Department—Supervising Architect, Engraving and Printing, Secret Service, *Bureau of Statistics*, *Life-saving Service*, Commissioner of Customs, Comptroller, Register of the Treasury, Auditors (six), Treasurer of the United States, Comptroller of the Currency, Internal Revenue, Director of the Mint, *Bureau of Navigation*, *Steamboat Inspectors*, *Lighthouse Board*, *Coast and Geodetic Survey*, *Marine Hospital*, Bureau of Immigration.

The bureaus in italic are those proposed to be placed in the Department of Commerce and Manufactures.

The association also proposes the following departments and bureaus to be included in that department:

The Department of Labor, which was established in 1885 as an unattached bureau in charge of a commissioner, deals chiefly with matters directly related to the industrial interests of the nation. The investigations by this department of the cost of production of various staple articles and materials, and the inquiries touching strikes, lockouts and other features of the relations existing between employers and employed are matters which bear directly upon the commercial and manufacturing interests of the nation.

The United States Geological Survey, which forms a bureau in the Interior Department, is engaged chiefly in work that is purely scientific in character, and which does not relate directly to practical business affairs. Certain features of the work of the Survey, however, have a very direct and important bearing upon the industrial interests of the country. The collection of statistics of the production of minerals and metals, and the exploitation of the mineral resources of the country form a line of work that is of practical commercial value. It is likely that the transfer of such work to a Department of Commerce and Manufactures would be of advantage to every interest concerned. Mining, metallurgy and manufacturing are so closely interwoven and so inter-dependent that they natural group themselves together.

The Association also suggests the inclusion of the river and harbor improvements for the following reasons:

Again, it has been suggested that the improvement of the rivers and harbors of the country has no logical connection with the War Department. The reason for placing all these public works under the direction of the War Department doubtless lies in the existence of a large corps of skilled army engineers whose services can be best utilized in times of peace upon the construction and maintenance of public works for the benefit of the nation's commerce. Many civilian engineers are now employed in this work, and the natural and intimate relation of waterways improvement to the commercial interests of the nation invites consideration of the advisability of transferring these functions from the War Department to the proposed department of Commerce and Manufactures. These arguments concerning the Department of Labor, the Geological Survey and the War Department are suggestive, however, rather than conclusive.

The Institute of Architects should join hands in this matter with the Natural Association of Manufacturers and at the same time urge the formation of a separate Department for Public Works which is as much if not more needed than Department of Commerce. The Public Works are now under charge of the Supervising Architect and attached to the Treasury Department, an attachment purely arbitrary and should certainly be severed therefrom at the earliest opportunity. The result of the present arrangement is so patent that we need say no more on that subject.

All other public works outside of building, generally included under the term of engineering, should be included in the Engineering Bureaus of the Public Works Department, including the river and harbor improvements which is suggested above to be placed in the Department of Commerce by the Association. This, however, naturally falls under Public Works.

This matter seems a matter worthy to be taken up by the American Institute of Architects and we hope they will urge upon Congress the necessity of a general re-arrangement of the departments in accordance with modern necessities.

THE ARCHITECT'S BOND FOR THE CITY HOSPITAL, NEWARK, N. J.

FROM *The Engineering Record* of New York, in its issue of May twenty-third, we copy a leading editorial on the absurdity and injustice of requiring or expecting an architect to furnish bonds that the cost of work under his control shall not exceed a stipulated amount.

What would be thought of demanding that a doctor give bonds that he cure his patient, when the patient is free to disregard his doctor's prescriptions; or that a lawyer should bind himself to win his clients case, whether that case was just or unjust. Yet, that is no more reasonable than to require an architect to bind himself that his client shall not spend more than a fixed amount:

"We have had occasion a number of times in the past to comment on the requirement under which a bond is exacted from an architect or other professional man to perform or control something which is beyond his power. Some of the smaller municipalities of the country have occasionally resorted to that vicious procedure, put it seems to be left to the authorities of the city of Newark, N. J., to appear in this particular role among the larger cities of the East. It appears from the publications of the daily press of Newark, that a young architect of that city, Mr. Wilson C. Ely, has drawn plans for the city hospital, which have been or are about to be accepted. Under this acceptance he is to furnish a bank to the amount of $20,000, to indemnify the city against expenditures in excess of $200,000, or those incurred by reason of neglect of the builders to conform to specifications. All this doubtless appears plausible enough to the average common councilman, who has had little to do with or to think of matters beyond the range of ward politics, and it is not unlikely that a young architect fails to give such matters their proper consideration in his eagerness to secure the substantial beginnings of his professional practical. Both these parties, however, are making serious mistakes, if not worse, in entering any such bonded relations.

"In the first place, building committees in charge of such works are seldom composed of men who appreciate the niceties of professional relations, and they too often desire to impress their individualities on work in their charge by modifications of plans without adequate regard to costs or to the architect's ideas of them. In the second place, an architect's estimate cannot often be made with that exactness, in view of the contingencies of builders' bids, which would justify him in guaranteeing the precise limit of cost. His estimate, being subject to these vicissitudes of every day practical experience, should be regarded as the nearest amount to the actual final cost that can reasonably be computed prior to the receptions of the bids. Any attempt to wrest these features of the situation out of their natural proportions or relations will result either in hardships to the architect, or in unprofessional attempts of the latter to evade these hardships or to justify his original position or to other complications leading possibly to litigation, or to all these prejudicial results combined.

"The inevitable consequence of such miserably unbusinesslike procedures is the complete removal of the rational and only proper relations which can exist between the professional man and his client to the detriment of the work in all its details and stages. It must be assumed that the architect will perform his duties in good faith, and in that case conditions are certain to develop under the bond, if enenforced, which seriously will militate against his efficiency. If he does not act in good faith, the pressure of a bond will simply sharpen the keenness of his efforts to evade it. In no event can the bond do any good, and in scarcely any event can it fail to do harm, and much harm.

"The preceding observations show that the bond, among other things, also obliges the architect practically to undertake the control of the building committee. That is usually somewhat of a job, but he must further undertake to indemnify the city against any expense that may be incurred by reason of neglect of the builders to conform to specifications. It is obviously the duty of the architect to exercise the utmost diligence in inspection, and in every other reasonable way to secure the desired excellence both as to material and workmanship, but if after the performance of his whole duty an unscrupulous builder shall have succeeded in introducing in the work that which is an injury to it, as sometimes happens, it is simply common sense to require the builder (and not the architect) to make good that injury. That is the usual procedure, and it accounts for the bond which the builder or contractor gives. It would be difficult, even for a Common Councilman of Newark, to show why the party causing damage by a violation of the specifications, though he should not be caught in the act, should not bear the cost of the consequences of his own violation of agreement.

Any endeavor, such as that contemplated, to shift responsibility so as to prevent its resting where it belongs, is thoroughly irrational and must inevitably impair the efficiency of both the architect and the contractor. It rewards the irregularities (to use no stronger word) of the latter by removing responsibility, and it heavily hampers the former by placing upon him burnens not his own, if, indeed, it does not tempt him to overlook faults of material and construction. The procedure is utterly unbusiness-like, unprofessional, and full of danger to all parties concerned. No conporation should desire it, and no architect should desire it, and no architect should consent to it.

AN ARCHITECTS LEGAL RIGHTS AND DUTIES.

OUR readers will remember the intelligent and reasonable view which has already been taken by the Main Courts of the duties and responsibilities of architects, and it is a satisfaction to be able to note another Main decision affecting the profession, in which the same principles are maintained. In a recent case, an architect was employed to prepare plans and specifications for a house. He had to sue for his pay for them, and the owner, who had not apparently used them, set up in defence that the architect's services were not beneficial to him, for the reason that they were performed in a manner contrary to his express directions and wishes. The explanation of this was, as appeared from the testimony, that he requested the architect to make him plans and specifications for a house to cost twenty-five hun-

dred dollars, "and no more," as he alleged; and when the plans and specifications were made, it turned out that they could not be carried into execution for less than about twenty-seven hundred dollars. In the court below, the judge instructed the jury that if the architect was explicitly told by the defendant, in addition to other things, that the building he was designing must not exceed a certain named cost, the architect should have made plans accordingly, or stated that he could not do it, and thereupon declined to do it; and that if he undertook to make plans with the restriction as to the cost of the building, he must do it before he could recover any pay.

The Supreme Court held that this instruction was erroneous. "It punishes the plaintiff" said the Chief Justice, in delivering the opinion of the Court, "for what might be merely an honest mistake or miscalculation, it leaves out the elements of care and good faith. . . . The ruling implies a guaranty or warranty, when none was testified to, or really pretended. Upon the testimony reported, the Court is of the opinion that even if the defendant's version of the facts be true, then the undertaking of the plaintiff was to make plans for a house to cost twenty-five hundred dollars and no more; and if, acting in good faith, he exercised his skill and ability in an endeavor to bring about that result, that it is all that could be expected or required of him; and no defence is established against his claim even if he failed in his attempt. But if the house designed by him could be built for less than twenty-seven hundred dollars, it could hardly be called a failure, especially in view of the interferences on the part of the defendant's wife; nor a failure if the plaintiff could have so altered his plans, as he claimed might have been done had he been permitted, as to to reduce the house in price; and it seems preposterous to to say that he could not; and he was willing to make alterations, but the defendant or his wife would not consent thereto." In the first part of the opinion the Court laid down its view of the general principles of the employment of architects as follows: "An architect is not a contractor who enters into agreement to construct a house for its owner, but is his agent to assist him in building one. The responsibility resting on an architect is essentially the same as that which rests upon the lawyer to his client, or upon the physician to his patient, or which rests upon any one to another where such person pretends to possess some skill and ability in some special employment, and offers his services to the public on account of his fitness to act in the line of business for which he may be employed. The undertaking of an architect implies that he possesses skill and ability, including taste, sufficient to enable him to perform the required services at least ordinarily and reasonably well, and that he will exercise and apply in the given case his skill and ability, his judgment and taste, reasonably and without neglect. But the undertaking does not imply or warrant a satisfactory result. It will be enough that any failure shall not be the fault of the architect. There is no implied promise that miscalculations may not occur. An error of judgment is not necessarily evidence of a want of skill or care, for mistakes and miscalculations are incident to all the business of life." It will be remembered that the Supreme Court of Texes held the same doctrine, in very similar words, in a case of this kind, so that architects may feel that their legal position in such matters is now tolerably well established in this country.—*The American Architect and Building News.*

THE UNIVERSITY OF CALIFORNIA.

THE University of California has taken a very sensible step in deciding to make provision at once for a systematic and well-studied plan for the buildings which it now needs, and for those which it is likely to need hereafter, for, at least, the next twenty-five or thirty years, says *The American Architect and Building News*. The University owns a beautiful tract of land at Berkeley, near San Francisco, and proposes to invite a general competition for a system of buildings suitable for erection on this tract, with, naturally, suggestions for an appropriate topographical scheme. It is intended to select in the first competition, which will be for sketches only, a certain number of plans, the authors of which will be paid a suitable sum, and compete for the final award, which is to carry with it the making of designs for all the buildings likely to be needed for a quarter of a century to come, and their execution, as the necessities of the University may require them, and its resources permit their erection. It is well known that the University of California has made a very rapid growth in influence and importance within a few years, and the Regents could hardly have taken a wiser or more judicious step than in providing thus early against the wasteful inconveniences arising from a confused arrangement of such buildings, as well as in securing for future generations of young people the æsthetic advantage, which is every day becoming better understood, of artistic surroundings at the most impressible period of their lives.

It is a misfortune that the excellent intentions that have animated the Regents in formulating their programme are not likely to evolve better results. They have sought advice and enlightenment from members of the profession in all parts of the country and have received it without stint, but it has evidently been of a very varying and often contradictory character. Doubtless, much advice that was rational and excellent had to be set aside, as it was found to be in opposition to the enabling legislative act which governs the Regents' course and makes a public competition obligatory. The double-competition method is peculiarly adapted to the problem in hand and if the requirements of the programme for the first one are as simple, and the requirements as exactly stated as they should be, the fifteen prizes of five hundred dollars each offer a sufficient incentive and a fair recompense if the number of competitors is not to be unduly large. But if the requirements are simple and the rewards fairly attractive, a very large number of designs will be sent in, not by the leaders of the profession, but by the average practitioner, the draughtsmen and the office boy, not only in this country, but in England, France and Germany as well, for architects in these countries are especially invited, and are promised they each shall have a representative on the jury. What is likely to be the result of this competition so conducted? This: the Regents will, if properly aided by their experts, find that the solutions presented will arrange themselves in half a dozen general groups, one group of which will be found to be pretty obviously the "*plan type*" the Regents are seeking. But there may be scores and scores of designs which all contain the essential elements, and all practically identical with one another, and yet, one and all, the work of men to whom no sane business man would entrust the work. It is one thing to preceive how to do a thing, but quite another thing to do it. Invention in all of its forms is largely a matter of accident, and the discovery of a typical plan is often as purely an accidental matter as any other "discovery," and in the discovery of the germinal idea of the solution of such a problem as this the tyro and Nestor are more on a par than the latter likes to believe, and it is tyros and not Nestors who will risk their time and labor in a scramble that is open to all the world. The Regents, under the terms they proposed may count on having may schemes presented to them—so many that it will be impossible to award the few prizes with fairness—and many, after all, find that the method they have followed has deprived them of the very aid they desire to have.

COMPETITION IN BUSINESS.

THE two absorbing phenomena of to-day, both in economics and in politics, are the opposite two tendencies—Centralization and socialism. It seems quite sure that the former must run its courss, be its own cure, or fine its complete and final expression, as all anti-trust laws and enactments are vain and futile. It is a tendency of the age which can not be stopped by artificial barriers. It is not often clearly seen that it has much in common with socialism, in the suppression of individualism and of competition, and in its effort to bring all things to the stagnation of a dead level.

Socialism is a beautiful theory, charming in books, but going to pieces in actual operation. How do you know? Of the many efforts which have been made to give practical expression to this idea in business, but few can be said to have had even a modern share of success. They do fairly well when the seas are smooth, and the wind is fair, but in the time of storms and financial stresses, they are pretty sure to be badly wrecked.

It is now seen by those who have given the matter a partial study, that Socialism is confronted with two insuperable difficulties. The impossibility of realizing, excepting temporarily, and in a most limited degree, the Utopian state where each man shall have absolutely a fair and untrammeled chance in life, and the equal impossibility of maintaining this state of affairs when it is once reached.

The plain truth of the matter is that in business, as in nature, the laws of the survival of the fittest and of natural selection work unerringly and unceasingly. They are the essentials of progress, and no sort of an advance is possible without them. It is by keen and active competition alone that new things have developed, new enterprises been brought forth and new methods inaugurated. The best proof of this is the study of some of the nations of the old world, particularly those in the East, where the methods of barter are the same now as prevailed a thousand years ago, and where such things as honesty, fair dealing and frankness are looked upon as iridescent dreams. A shining example to the contrary is in our own country, where the finest hardware in the world is produced, and where we have the best things in this line that the ingenuity of man is able to devise, and we all know what competition means in this country.

If this competition seems at times ruthless and grinding, it denies the right of the unfit man to continue as an individual factor, and is certainly far less cruel than that we see in the every day life of the natural work.

Since the survival of the fittest is a fact proven by experience, it is useless to shut our eyes to it, or to endeavor to set it aside by Utopian means, for humanity has at last reached the stubborn conviction that somehow the highest good must underlie all this, or else it would not be an absolute accompaniment of progress. Further than this, one can not help feeling that if business be warfare, yet nevertheless it is a very mild and modified style of fighting, and that there was never so much frankness, so much honesty in dealings, so much courtesy and kindly feeling between competitors as now prevailing.—*The Age of Steel.*

A BILL TO CHECK THE WASTE OF TIMBER.

A BILL is pending in Congress which, if passed, would do much to check the frightful waste of timber in this country through forest fires. This bill, which is introduced in the House of Representatives, with the sanction of the Committee on Public Lands, provides that the Secretary of the Interior shall be authorized to survey and mark, through all public forests which are liable to destruction by fire, avenues, one thousand feet in width, and five or ten miles apart, running in such directions as will make them most effective in preventing the spread of fire. The timber now standing in these avenues, or ways, is to be offered for sale at public auction, each purchaser binding himself to clear the tract for its entire width, so far as his purchase extends; and, when no bidders appear, the work of clearing the avenues is to be done by contract. The proposed bill is approved by the American Forestry Association, and would probably be passed without difficulty, were it not for the fact that the work of clearing the avenues, in the forests too far from railroad transportation to make the timber valuable, would involve an expense of, at least, half a million dollars, and Congress is not now in the mood for making appropriations which can be postponed.

One trouble about such a law would seem to be that, as it is made no one's interest to see to keeping the avenues, or "ways," clear of brushwood, it would be necessary to repeat the clearing operation every three years, at least, in order to make them effective as barriers against fire; and, as no one would pay anything for the brushwood, the whole expense of the clearings, after the first, would have to come out of the public treasury. Perhaps our public forests are too far from civilization to be treated like those in Europe, but it seems as if it might be possible to gain, at least for some of them, reasonable protection in exchange for certain rights, without calling on the National Treasury to make up the deficiency. We remember spending a day once in the New Forest, in England, which covers seventy-six thousand acres, and yields a net revenue of something like two dollars an acre per year. Speaking about danger from fire, we were reminded that there is no underbrush in the New Forest, and that forest fires cannot start without underbrush; and we were told that the New Forest is kept free from this source of danger, in the simplest manner, by merely authorizing the people who live in the Forest, which, it must be remembered, contains many villages and hamlets, to help themselves to all the brushwood that they need. Of course, the Crown officers determine what shall be considered brushwood, so that there is no danger of interference with the young trees of the valuable sorts; but, apart from these, the ground is free from the inflammable mass of twigs and shrubs which chokes the edges and cleared por-

tions of all our forests, and fires are practically unknown, although the roads through it are mere narrow lanes, which would not check a rdgular forest conflagration for a moment. As the new forest, is Crown property, all the people who live within its limits are tenants of the Crown, and are thus to a certain extent under the control of the forest officials; and it seems not unreasonable to suppose that a somewhat similar system might be applied to our great forests, both public and private. Instead of cutting up the public forests by enormously wide avenues, which must be kept clear at a vast annual expense, and would needlessly sacrifice a very large part of the land, it might, for example, be possible to lay out roads of ordinary width, and, after cutting and selling the timber from a strip five hundred feet wide on each side, to lease this strip to tenants, at a low rent, for cultivation, and allowing them the privilege of gathering brushwood for fuel in the forest beyond, under the supervision of the forest guardians. Of course, some of our forest land is so poor and sandy that it would be worthless for cultivation, even if cleared, but much of it is quite rich enough to attract tenants on such terms, and it is hardly necessary to say that a strip of cultivated land is quite as effective for checking conflagrations as a similar strip overgrown with ferns and brushwood; while the fact that the lives of the tenants of the strip might be sacrificed in case of forest fires in the neighborhood would give them a special interest in seconding the efforts of the forest wardens to remove sources of danger.—*The American Architect and Building News.*

ANTIQUATED STREET CAR HEATING.

WITHIN the city limits and near them there is in use a method of heating street cars which would be appropriate in Wayback, but seems somewhat out of place in the metropolis, says the New York *Sun*. It is used on the street car route connecting City Island with Bartow, a route very much overcrowded in Summer and very little used in Winter. The cars have to be run all the year round or the company would lose its charter. No provision was made in the building of the cars—they are gems of antiquity—for the introduction of stoves or any other means of keeping the passengers from freezing; so the company, in a spirit of kindliness, has put oil stoves into the vehicles. Each car has its own little stove set down in the middle of the floor. Around the stove the passengers gather, and they are expected to give it such care as is needed. Sometimes it happens that there are no passengers, in which case the driver, who is also conductor, takes the stove out on the platform and sits on it for warmth. One cold day recently a party of three men were the sole occupants of the car.

On the way to the City Island they disembarked quietly; so quietly that the conductor didn't notice their departure. He did notice, however, on his arrival at the terminus, that the oil stove was missing, and he concluded that he would have to settle for it. But on the return trip he found the stove standing in the middle of the tract near a cross road, and on it a piece of paper, held down with a stone. The writing on the paper read:

"Being obliged to wait here for a delayed conveyance, we took the liberty of borrowing the company's oil stove. Enclosed find balm for the wear and tear upon your anxiety."

The paper contained a half dollar.

A NEW FIRE-PROOF FLOOR CONSTRUCTION.

A NEW sort of fire-proof floor construction is described in the *Deutsche Bauzeitung*. It is a patented affair, applied only by the firm of Muller, Marx & Co., of Berlin, but it has some interesting features. After a floor has been laid with iron beams, which may be spaced two feet from centres, or even more, if the floor between them is given a curved intrados, parallel slips of sheet-iron, on edge, are laid on them, four or five inches apart. The intervals between the slips are then filled with similar slips, bent to a zig-zag shape, so that the angles will just touch the longitudinal slips on each side, and the points of contact are secured together by wire rings. This skeleton is then filled in with concrete, and the floor so made is found to have great resistance, so that, as the patentees claim, it will support safely a load of one thousand to twelve hundred pounds per square foot.

CHICAGO ARCHITECTURAL CLUB.

THE Syllabus of the "Chicago Architectural Club" for 1896—indicates a healthy interest among the architects of that locality in their profession. Clubs working on the same lines in all the large cities of America would advance the progress of architecture materially. As the result of the club's experience so far it is worth while quoting their syllabus *in extenso*.

"Encouraged by the growth and activity of the Club in the past year, it is proposed to broaden more than ever our range of action.

Believing that the greatest benefit is to be derived from united work and continuous criticism among ourselves rather than from many competitions which, as a rule, excite but little emulation, the club proposes to take up the study of serious problems, which will be studied by the members organized as a class, having a regular time of meeting. The first of these, which will be entered upon immediately, will be the central portion of the new Lake Front Park, which has been delegated to this club by the Municipal Improvement League.

Beginning with the second Monday in January, and on every second Monday following, there will be meetings devoted to illustrated lectures on architecture, and artistic and practical subjects related to it. At irregular intervals in this series there will be exhibitions of lantern slide views of Architecture in Europe. The subjects exhibited will be discussed by those present.

The "Bohemian Nights" will be kept up, beginning for the year on the first Monday in January, and occurring on every second Monday succeeding.

The months of June, July and August will be devoted entirely to outdoor work, sketching trips, bicycle tours, etc.

The regular meetings will be discontinued during these months, but the Club house and the class-room will be kept open for the use of members at all times.

The classes of the year will be kept up and meet as follows:

Every Tuesday evening will be devoted to the study of the regular problems in Architecture.

The class in Pen and Ink Rendering meets every Thursday evening.

The class in Architectural Modelling meets every Friday evening.

The class in Sculpture and Drawing from Life meets on Saturday evening; this class is conducted jointly by this Club and the Chicago Society of Artists.

The class in Water Color meets on Sunday mornings.

No tuition is charged for any of these classes.

The Music Pavilion in the Lake Front Park will be the subject of the Third Annual Competition for the Gold Medal presented by the American Institute of Architects.

The subject for the Eight Annual Competition for the Robert Clark Testimonials will be announced before the Summer vacation.

The Ninth Annual Exhibition will be held at the Art Institute beginning on March 27, 1896.

POINTS ON PLASTERING.

PERHAPS some information on the general practice of lathing and plastering will be interesting. There is undoubtedly much bad plastering, and in every case the mortar and plastering material is blamed. This is not just.

The first essential of good plastering is good preparation to receive it. For plastering on brick or terra cotta, have your work straight and true, the joints rough. Don't use dry press brick, nor terra cotta with smooth face. If your walls are not straight don't expect to get a straight wall in two-coat work—lime mortar cannot be made that is equally good when used half an inch thick and two inches thick in the same wall.

Don't plaster with cement made from gypsum or similar compounds, such as acme, royal, agatite, etc., on Columbian fire proofing, or on Portland cement, unless you have them dry enough to prevent sweating or condensation. Portland or native cements, or even lime mortar is preferable in such work. Don't allow mortar to go on thicker than ¾ of an inch at one time, and have your brick or cement free from dust or dirt. Don't plaster on smoked bricks or old bricks from chimneys; they will stain badly.

In preparing for lathing have your joisting, trimmers, etc., heavy enough to prevent vibration, and strap all large ceilings, using 2"x2" strapping on 16" centers. If you don't strap, at least have all joisting and studding sized; very much crooked work would be avoided by enforcing this rule. Have all angles made solid. See to it yourself and don't rely on lathers who work by the piece to inform you of the carpenter's defects, and have trouble with him in consequence.

Use white pine lath, seasoned but not to dry; 1⅜"x⅜" lath are light enought; 1"x⅜" lath are only fit for use on joisting or studding at 12" centers. 18" breaks are frequent enough, but don't allow lath to break at door posts; the slamming of door or even the nailing of trim will cause a crack here. Don't blame the plasterer for this when you have allowed the carpenter to center his work so as to cause waste of time and lath to avoid it. Don't be unreasonable. Contractors are working at close figures for a living. Blame the right party. When you see a crack at an internal angle just above base, you did not have that angle made solid, and nailing the base caused it to crack.

Lath stains cannot be avoided in two-coat work, and are even more liable to appear when patent plasters are used, as the first coat is put on much thinner to save cost. Two-coat work is also liable to have every lath and joist show through when work gets old—you can count them through the plaster. * * * *By "Plasterer" in the Canadian Architect.*

SAFEGUARDS FOR THE MODERN BUILDING.

IN commenting on the recent disaster to a building in Cincinnati in which several lives were lost and several others wounded, the *Times*, of Pittsburgh, referring to the cause—the explosion of a gosoline engine used for driving a dynamo for lighting the building—says: "While we have been greatly improving the housing of the people and the comforts and conveniences they enjoy, it has in many cases been secured at an increased risk of life and limb which overbalanced the apparent advantages gained." And further points out that "the Cincinnati disaster ought to prove an incentive to more care in the erection of buildings as well as in the safeguards thrown around the modern powerful forces which are placed within them." The conditions under which the house of to-day is erected, with all its modern improvements, are very different from those existing under more primitive conditions, and required not only greater care in introducing these improvements, but greater care in construction to provide the greater strength called for by machinery, electric systems, etc. Even within the short time electric lighting has been used the need of proper insulation has created a special industry to provide effective protection from diverted currents and fires in consequence. In fact, the path of advance in almost every similar line has called for extra precaution, and like provision of safeguards is needed against the new agents brought into use by the requirements of the modern building.

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.
Seth Babson, Pres. W. P. Moore, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Southern California Chapter American Institute of Architects, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
Octavius Morgan, Pres. A. M. Edelman, Vice-Pres.
Arthur B. Benton, Sec't. August Wackerbarth, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.
Geo. W. Dickie, Pres. W. G. Curtis, Vice-Pres.
Otto Von Geldern, Sec. Edward T. Schild, Treas.

Master Plumbers' Association, meets every first and third Friday of each month at the Flood Building.
Jas. E. Britt, Pres. J. L. E. Firman, Sec.

Builders' Exchange, Directors meet first Friday in each month at Mission and New Montgomery.
Oscar Lewis, Pres. Jas. A. Wilson, Sec.

Masons' and Builders' Association, meet first Friday evening of each month.
Adam Beck, Pres. M. V. Brady, Sec.

BOOKS AND PERIODICALS.

Journal of the WESTERN SOCIETY OF ENGINEERS, papers, discriptions, abstracts and proceedings. published bi-monthly by the society, 1737 Monadnock Block, Chicago, Ill. The opening article entitled "Mechanical Methods of Rock Excavation Used on the Chicago Main Drainage Channel," will be found of great interest as giving some of the latest improvements in the methods adopted to do away with the use of the pick and shovel and the hydraulic dredge—this article is fully illustrated by half tone engravings that give a very good idea of the progress of this great undertaking.

FIRE AND WATER, a New York publication devoted to furnishing information in regard to these important interests, comes to hand as a Convention Number with a history of the proceedings of the Convention at Indianapolis of the American Water Works Association. From a comparatively small beginning in 1881 of a number of water works men, whose chief aim was mutural instruction, the association has gradually grown in numbers and influence, till now it is recognized as a real power in the country.

As an adequate supply of water intimately concerns the well being of the community, and therefore interests each individual all the information obtainable upon the supply and purification of water to our cities and large towns is very desirable.

PROCEEDINGS of the TWENTY-NINTH ANNUAL CONVENTION of the AMERICAN INSTITUTE of ARCHITECTS, held in the St. Nicholas Hotel, St. Louis, October 15th 16th and 17th, 1895. Published by the Board of Directors of the A. I. A. under direction committee on publication and library. Alfred Stone editor, Providence, R. I. This volume contains the likeness of the late Robert M. Hunt. A list of the members present at the Convention as well as a list of all the members. The President's address is well worthy of careful consideration not only by the Architects, but the public at large who are interested in having our Government buildings more what they should be, than what they are.

WOLSEY'S GOLD KNOCKER.

JAMES Payne says that at Ottford, in Kent, there was formerly a palace of the archbishops of Canterbury, in which Wolsey is said to have held his court. "It was but a small place and is now a farmhouse, picturesque enough, but exhibiting no special signs of prosperty. The other day, however, this little incident happened: The farmer sent for a carpenter to do some odd jobs about the house, and among other things to mend the knocker. The man took it off and said, after a close examination of it: 'Do you know what this knocker is made of?' 'Why, brass, I suppose.' 'No; it is pure gold.' And it was. Think of the years that that rich prize has hung at the mercy of every tramp?"—*Boston Transcript.*

THE NEW PLUMBER.

EVERY reader of this paragraph is no doubt able to give a satisfactory definition of the work "plumber"—that is, satisfactory from his own point of view. If he is a scholar and acquainted with the dictionary history of the word, he would perhaps entertain us with the literal meaning of the word, which is, "a worker in lead." On the other hand, if he is a mechanic of middle age. with the traditions of the shops of his boyhood in mind, he would perhaps give us, in addition to a definition, some particulars concerning the way in which the trade was conducted when he was an apprentice. Again, if he is a young man of the period, or a man of general observation, he would possibly tell us that a plumber is a man who works largely with iron, brass and plated fittings, who puts in place articles manufactured in large establishments known as plumbing supply concerns, and who occasionally has a little lead work to do.

If we take still another view of the plumber, we are afforded a very different conception of his trade. In certain parts of the country, at the present time, if anything is wrong with the stove, from a mica light to a burned-out grate, or from a superannuated piece of pipe which needs replacing, to a lid lifter which has been lost, the mechanic or tradesman who seems to be first in mind, to whom the housewife should send for the necessary assistance and repairs, is a "plumber." Again, in certain sections of the country, if anything is wrong with the roof or the leader pipe, a "plumber" is sent for, notwithstanding there is no lead whatever about the roof covering. It is the plumber who cleans out the furnace, and it is the plumber who digs a trench for water service or drainage, and it is the plumber who is useful in fixing a pump and occasionally in doing still other odd jobs about the premises.

Going only a little way back in the industrial history of the country, especially outside of the large Eastern cities, the mechanic who formely did all these things was the tinner. Tinners, years ago, or perhaps we should say originally, were men who made tinware or assortment ware, as it was called, but as that trade declined, or, rather, as the demand for hand-made tinware declined before the fierce competition of factory-made goods, the tinner was obliged to find something else to do. Accordingly, in a short period, he become the handy mechanic of the community in which he lived. He repaired the pump, he fixed the range, he tinkered the roof, he mended a leak in the water pipe, and at times he would even put in a piece of glass. On occasion he has been known to do a bit of painting, while fixing cesspools, running drains, putting up windmills and arranging a domestic water supply upon one or another of various plans, are pieces of enterprise that have more or less fallen to his lot since his original calling failed him. The tinner became a roofer because metal roofing came into demand about the time that assortment ware, as it was commonly called, went out. He became a cornice man because sheet metal cornice work was in demand when his industry went into decadence. From a cornice man he became a skylight maker. In some instances the tinner took up certain branches of work which has commonly been assigned to the plumber. He did plumbing work in the absence of plumbers in his locality as best he was able.

The passing of the plumber as he was, that is, as a mere lead beater, and the passing of the tinner as he was, are among the peculiar industrial incidents of the day. Of tinners of the old school probably we shall never have any more, nor are we likely again to have plumbers of the old school in the sense of men who beat out of lead the traps they employed, who made their own fittings, and who took the greatest pride in their manual skill. The plumber of the day is a good mechanic in what were formerly different lines of trade. He is a handy man and able to take care of himself wherever placed. He is able to fit iron pipes, to put in place tubs and trays, and bowls and closets and various other fixtures, in the making of which he is not concerned in the least. He is a man with many times the scientific knowledge of his father and grandfather in the trade, and a man carrying much larger responsibilities than ever were known to the plumber of old. The plumber that can do some of the duties that formerly belonged to the tinner is especially useful. And those who have come into the plumbing trade out of the tinners' school find their old knowledge and skill in frequent demand. Two-branch hands and three-branch hands are much in evidence, especially in the smaller towns.

Many tinners are naturally turning to the plumbing trade at the present time, not to the trade as it was formerly conducted, but as it has been latterly carried on, and right good plumbers do they make, particularly when they take the trouble to become equipped with the scientific part of their trade, gained by a course at a trades school, or by careful perusal of books and technical papers. Useful plumbers n advancing the interests of the trade do they also become when they secure membership in a local association, or take the initiative in establishing an association. The plumber and the tinner of the future may possibly blend, not that either will entirely lose his identity, but that the two will be doing similar work in the community at large. Still later, it is possible that the plumber of the period will be a man doing things differing materially from what the plumber of to-day is doing. The trade is not yet finished.—*Sanitary Plumber.*

NEW PLUMBING LAW FOR NEW YORK CITY.

LAST month Governor Morton signed the new plumbing law for New York City. This law requires all master plumbers to register their names at the Building Department and thereupon the person so registering shall receive a certificate of registration from the department, "provided he holds a certificate of competency from the Examining Board of Plumbers. The time for registration is March. Where, however, a person obtains a certificate of competency at a time other thon in March in any year, he may register within thirty days after obtaining such certificate of competency, but he must also register in March in each year. The registration may be cancelled by the Superintendent of Buildings for a violation of the rules and regulations for the plumbing and draining of the city, or whenever the person registered ceases to be a master or employing plumber, after a hearing before the superintendent and upon a prior notice of ten days. It is made unlawful for a person to expose the word 'plumbing' or 'plumber' or to enter into partnership with a registered plumber unless all of the parties to the co-partnership or firm are registered." The law makes violation of the provisions of the act misdemeanor, and subjects the person on conviction to a fine of $250 or three months' imprisonment, or both, and forfeiture of certificate of competency. The law seems a very stringent one, and with its provisions for inspection should hold plumbers pretty strictly to their duties.—*Architecture and Building.*

PARK LODGE, SAN FRANCISCO.

THIS Lodge for the purpose of housing the Superintendents of the Park and as headquarters for the Park Commissioners and officers in charge of the Park, as well as a store house for tools, implements, seeds, etc., is built of stone with a terra cotta tile roof. The interior is finished in hardwood and redwood. Edward R. Swain was the architect.

The plastering was the work of J. R. Tobin, who has done his part of the work in such a complete and workmanlike manner as to add materially to the charm of the pretty interiors which abound in the Lodge—what ornamental plaster work there is has been rendered faithfully and effectively.

The body of the building is built of the hard sandstone quarried in San Francisco at Twenty-sixth and Douglass

COMMISSIONERS' ROOM, PARK LODGE, SAN FRANCISCO.

street by Gray Bros. This sandstone is a remarkably hard and heavy sandstone being heavier and stronger than granite and is of a pleasing blue color. This is the first occasion when stone quarried in San Francisco County has been used in any large amount, and Gray Bros. have conferred a benefit on this city by developing a building stone supply right in its midst and proving that San Francisco need not go outside its own precints for building stone. The same firm also did all the concrete work in and about the Lodge.

The "Mission" Tile Roof, including the dormer windows, was put on by Jos. F. Forderer and forms the most artistic and durable roof extant. The tiles are of the small type and are laid up in cement, and makes a thoroughly waterproof roof. The Forderer Cornice Works have lately been removed to the Pacific Nail Works Building, 8 and 10 Natoma street, corner of First street, and includes in its business the manufacture of architectural sheet metal cornices, copper and zinc ornaments and tile, slate and metal roofing in all their branches.

The heating of the building is done by W. W. Montague & Co., and the woodwork by J. F. Logan.

ANNUAL CONVENTION OF CIVIL ENGINEERS.

THE American Society of Civil Engineers will hold their Annual Convention in the City of San Francisco. The Convention will open June twenty-ninth.

FLATS ON POST STREET.

THE row of flats on Post street near Larkin, built for Messrs. G. Berson and A. Cailleau, according to the plans of Wm. Mooser & Son, was erected by Mr. J. F. Logan the well-known contractor and builder at a cost of thirty-five thousand dollars.

CONCRETE.

The concrete foundations and stone sidewalks were put in by H. M. Petersen & Co. This work, the durability of which is essential to the well-being of the structure, was done with care that characterizes all of Petersen & Co's. work.

MILL WORK.

Mr. Andrew Wilkie turned out the mill work.

PLUMBING.

Mr. R. Rice did the plumbing, sewering and gas fitting and in a manner that was not only satisfactory to all parties concerned, but a credit to his skill as a competent mechanic. All the bath rooms have porcelain tubs and are finished with tiles; the plumbing is all open and finished with the latest sanitary appliances.

PATENT CHIMNEYS.

All the chimneys in these flats were built by the firm of L. E. Clawson & Co., with Clawson's Patent Chimneys. Each chimney has a bearing of four wrought iron stirrups 2½x½ with ¼ inch boiler flat iron full size of fire-place and hearth. There is eight inches of brickwork around the opening of each fire-place.

Clawson's Patent Hood and Arch-bar which projects seven inches from brick work to face of tiling of mantel is used over top of every opening. This hood makes a perfect seal and bond from brick work to mantel, thereby preventing one from settling away from the other. With this arrangement the fire cannot work in between the brick work and mantel and ignite the furring. The hood conducts the smoke to the flue without any break in the same giving a perfect draught.

The clay pipe used in these chimneys is composed of pure calcined fire clay full inch in thickness. The clay pipes are well cemented together at joints with metal bands six inches wide. There is a galvanized iron air chamber one inch larger than clay pipe which connects with top of roof and conducts off all hot air that may accumulate between clay and iron pipe. The chimneys are braced every four feet with wrought iron braces which keeps them one and a half inches away from all wood work making a perfectly safe chimney with a perfect draught.

This firm superintends all of their work and have never had a fire from one of their chimneys in the eighteen years they have been in this business. Particular pains is taken in the construction of their chimneys so that they will draw and give entire satisfaction.

BUILDING PAPER.

To insure absolute protection against dampness, heat, cold or dust, all the walls of the building are sheathed with P. & B. Building Paper, a California production manufactured by the Paraffine Paint Co., 116 Battery street. This paper is now used in all first-class houses and is specified by all the leading architects as a most perfect insulator.

HARDWARE.

The hardware furnished by Dunham, Carrigan & Hayden Co., made by Yale & Town Manufacturing Company in their Branford factory, is all of most recent designs and finish. The locks are all made with "easy springs" to relieve the jar when closing the door. The hardware is well adapted to this class of building.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

When Contractor for Public Work is not Liable for Defects in Work.—Under a contract to furnish labor and material for the construction of a public work, which provided that the contractor should, as to the quality of material furnished and the manner in which the work was done be subject to the directions of the engineer in charge, and that he should be paid monthly for the materials furnished and work done, such contractor is not responsible for defects in the work as a whole, if the directions of the engineer were complied with.

In re Freel (Supreme Ct. N. Y.) 38 N. Y. S. Reporter, 143.

Fire Escape Law in Ohio Unconstitutional.—The Supreme Court of Ohio holds that the law of that state in relation to fire escapes "on all buildings (save private residences) of three or more stories in height" "within any city of the first class and first class grade" is in conflict with the section of the constitution of that state which prescribes that "all laws of a general nature shall have a uniform operation throughout the state," and is therefore invalid, inasmuch as the act is of a general nature, and yet has operation in only one city.

City of Cincinnati v. Steinkamp, 43 N. E. Reporter, 490.

Sufficiency of Payment to Agent of Contractor.—A sub-contractor on a building authorized an agent to collect an installment due him for work done, given him a written receipt for same, made out to a title company, which had insured the mortgagee of the property against loss by reason of liens, and which was, for its own protection, superintending the disbursement of the funds belonging to the owner. The court held that, the company having paid the agent on the strength of the receipt in his hands, the subcontractor could not again collect his claim, though the agent embezzled the money.

Shroeder v. Waters, Sup. Ct. Penna, 34 Atlantic Reporter, 217.

Execution of Contracts.—A written agreement, of which there are two copies, one signed by each of the two contracting parties, is binding upon both, to the same extent as if there had been only one copy of the agreement, and both had signed it.

Morris v. McKee, Supreme Ct. Ga., 24 S. E. Reporter, 144.

Elevator Part of Building.—Where the original plans for a large building provided for an elevator, and the contract for the construction of the elevator was let when contracts for other work were let, the elevator was a substantial part of the building, and the building was not completed, so that limitations for filing mechanics' liens (under the laws of California) would run, until it was finished.

Coss v. McDonough, Supreme Ct. Cal., 44 Pacific Reporter, 325.

Lien not Invalidated by Claim Including Other Material.—The fact that a claim of lien for material used in a building includes material used in a side walk around the lot on which the building is located will not invalidate the lien, where an itemized statement in the claim renders it possible to determine the exact amount used in the construction of the walk, and the precise amount charged for same.

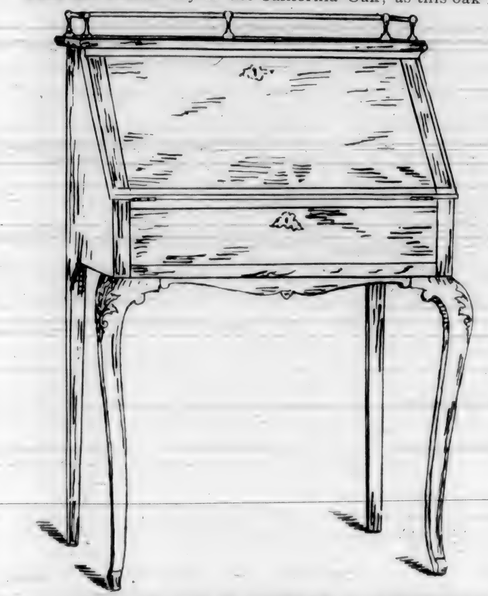
Harrisburg Lumber Co. v. Washburn, Supreme Ct. Oregon, 44 Pacific Reporter, 390.

Churches not Exempt From Liens.—A church is a "building" within the laws of California giving a lien for material used in a building, and is not exempt because another statute makes "pews rented by householder in a place of public worship exempt" from debt.

Harrisburg Lumber Co. v. Washburn, Supreme Ct. Oregon, 44 Pacific Reporter, 391.

BUSINESS MOSAICS.

In calling attention to the advertisement on page x of the San Francisco Manufacturing Company, late of Chicago, it will be well to remember that this company make use exclusively of the California Oak; as this oak is



unquestionably superior to Eastern Oak, the buyer has the satisfaction of encouraging home industry, and at the same time obtain a superior class of goods. Estimates for Oak Flooring of California Oak are furnished by Mr. Charles J. Bruschke Manager, 644 and 648 Bryant street, San Francisco, Cal. Wood mantels, interior work and office furniture a speciality.

"I can see no reason," said the S. P. C. A. boarder, "why it should be thought advisable to dock a horse's tail." "Probably," suggested the Cheerful Idiot, "they are docked for being behind."—*Indianapolis Journal.*

The Imperial Porcelain ware with its substan tial thick ness, fine glaze and beautiful appearance is undoubtedly gaining ground among those who wish their houses to become an abode of beauty as well as of health. The reduction in price has no doubt had much to do with inducing householders to demand Imperial Porcelain, and once fairly introduced there is little to prevent its universal use in all first-class dwellings.

The J. L Mott Iron Works should be awarded the credit of having introduced and placed upon the market this much desired article while Mr. M. S. James, the Pacific Coast representive of this company is at all times prepared to show what has been done in improving this line of goods. Room 27 Flood Building, San Francisco.

Bachelor—"I am told that a married man can live on half the income that a single man requires." Married Man—"Yes; he has to."—*Town and Country Journal.*

Almost anything in the way of plaster decorations can be found at 28 Ellis street, San Francisco as well as at 375 Twelfth street, Oakland. Mr. Samuel Kellett the manufacturer also attends to plastering repairing and whitening.

CITY BUILDING NEWS.

Bartlett and 22d. To build; owner, Pat Deeney; architect, H. D. Mitchell; contractor, A. Petry; signed, June 4; filed, June 5; cost $3180.

Beulah near Cole. To build; owner, W. Hatteroth; architects, Salfield & Kohlberg; contractor, L. M. Weisman; signed, June 4; filed, June 6; cost $4727. Plumbing, etc.; contractor, H. Williamson; signed, June 4; filed, June 6; cost $376.50.

Boyce near Pt. Lobos. Cottage; owner, N. J. and A. E. Jorgensin; contractor, Peter Fredriksen; signed, June 6; filed, June 6; cost $1480.

Brannan near 5th. To build; owners, and builders, Campbell & Pettus; cost $2000.

Broadway and Devisadero. To build; owner, J. W. Ward; architect, A. C. Schweinfurth; contractor, Daniel Sweeney; signed, May 22; filed, May 23; cost $17,100.

Buchanan and Oak. To build; owner, Sine Ludvigsen, wife of N. P. Ludvigsen; architect, R. H. White; contractors, Campbell & Pettus; signed, May 21; filed, May 22; cost $1440.

California near Steiner. Stone work for church; owner, St. Pauls Church; architect, S. Newsom; contractors, McPhee Co.; signed, May 14; filed, May 22; cost $1800.

California near Steiner. All work except stone; owner, St. Pauls Church; architect, T. Newsom; contractor, R. Sinnott; signed, May 14; filed, May 22; cost $8722.

Central Ave. near Golden Gate. Cottage; owner, Diedrick Gerken; architect, Emil John; contractor, William Tegeler; signed, May 11; filed, May 12; cost $1420.

Church near 23d. Two-story frame; owner, Bridget Locke; architect, J. T. Kidd; contractors, Bassett Bros.; signed, May 25; filed, May 26; cost $2800.

Clay near Laurel. Frame dwelling; owner, C. E. Knickerbocker; architect, W. H. Lillie. days work; cost $12,000.

Clay near Spruce. Two-story frame; owner, T. J. Mitchell; architect, J. B. La Romer; contractor, W. C. Boswall; signed, June 3; filed, June 3; cost $2600.

Clipper near Sanchez. Cottage; owner, G. A. Miller; contractor, W. W. Rednell; signed, June 3; filed, June 3; cost $1800.

Connecticut near Napa. To build; owner, Michael Driscoll; contractor, John Keneally; signed, June 1; filed, June 4; cost $2139.

Devisadero and Ellis. Alterations and additions; owner, Cherubino Lombardi; architect, James E. Wolfe; contractor, George Lack; signed, May 29; filed, June 3; cost $905.

Devisadero near Post. Alterations and additions; owner, M. Foley; architect, T. J. Welsh; contractor, J. E. Mooney; signed, June 1; filed, June 4; cost $6000.

Dupont near Bush. Alterations to two-story brick; owners, Le Breton estate; contractor, W. T. Thompson; cost $5000.

Eighth near Harrison. Brick work, etc., for two-story brick; owner, S. F. Brewing Co.; architect, H. Geilfuss; contractor, F. Wagner; signed, May 22; filed, May 23; cost $1628.

Fifth and Mint Ave. Alterations and additions; owner, T. Kelly; architect, E. Kollofrath; contractor, Adam Miller; signed, June 8; filed, June 8; cost $2920.

Fifth and Mission. Painting various buildings; owners, Peter J. Donahue, Margaret Burke; contractor, Thomas F. Mulhall; signed, May 25; filed, May 25; cost $2300.

Fifteenth near Castro. Cottage; owner, Chas. S. Noyes; contractors, Marcuse & Remmel; signed, May 19; filed, May 20; cost $1710.

Fillmore near Union. Alterations; owner, Adolph Lefor; architect, C. Winstanley; contractor, Alve R. Wilkins; signed, May 25; filed, May 25; cost $2400.

Folsom near Jefferson Ave. Cottage; owner, James Rodgers; contractor, W. W. Rednell; signed, May 21; filed, May 21; cost $355.

Folsom near 9th. Alterations and additions; owner, W. Botsford; contractor, C. W. Little; signed, May 28; filed, June 4; cost $4500.

Fulton and Scott. Two-story frame; owner, J. D. Lacy; architect, E. H. Mathews; contractors, Knox & Cook; signed, May 6; filed, May 9; cost $4680.

Geary and Franklin. All work for one-story frame except painting and plumbing, etc.; owner, L. Schilling; architects, Salfield & Kohlberg; contractor, G. G. Gillespie; signed, May 8; filed, May 8; cost $5700.

Geary and Stockton. Concrete work; owner, S. V. Water Works; architect, Clinton Day; contractor, Geo. Goodman; signed, June 1; filed, June 3; cost twelve cents per cubic foot.

Geary and Larkin. Excavations, brick and iron work for two-story building and alterations to an old building; owner, Jones Schoenfeld; architect, Salfield & Kohlberg; contractor, F. Wagner; signed, June 3; filed, June 6; cost $4798.

Geary and Larkin. Carpentery, mill work, etc.; owner, James Schoenfeld; architects, Salfield & Kohlberg; contractor, John Furness; signed, June 1; filed, June 6; cost $9475. Plumbing; contractor, W. F. Wilson; signed, June 2; filed, June 6; cost $2017. Sidewalks, etc.; contractor, Silas A. Chase; signed, May 6; filed, May 6; cost nine cents per square foot. Painting and graining; contractor, J. L. Ostland; signed, June 2; filed, June 6; cost $985.

Haight near Cole. A frame pavilion; owner, Gustav W. A. Walterstein; architects, Knoth & Behrnd; contractor, Silas Carle; signed, May 11; filed, May 13; cost $7500.

Hampshire near 22d. One-story frame; owner and builder; J. Winstron; cost $1500.

Hampshire near 22d. Cottage; owner, J. B. Parr; builder, E. Eriksen; cost $1100.

Hampshire near 22d. Cottage; owner, Chas. Iiger; contractor, C. Eriksen; cost $1400.

Hancock near Church. Two-story frame owners, T. A. Bermingham and Hannah M. Bermingham; contractor, W. W. Rednall; signed, May 15; filed, May 15; cost $4600.

Harrison near Stanley Place. To build; owner, W. F. C. Schmid; architect, H. Geilfuss; contractor, L. B. Schmid; signed, May 8; filed, May 11; cost $3294.

Harrison and Dore. Two-story frame; owner, John Sullivan; architect, M. J. Welsh; contractor, Joseph Sullivan; signed, May 28; filed, June 2; cost $2000.

Herman near Steiner; Two-story frame; owner, Geo. Reichley; cost $4000.

Heron near 8th. Cottage; owner, Mary Sosser; architect, A. J. Barnett; contractor, T. W. Crawford; signed, June 2; filed, June 4; cost $1250.

Hyde and Geary. Carpentry, mill work, etc.; owner, Mrs. P. Rosenweig; architects, Salfield & Kohlberg; contractors, Campbell & Pettus; signed, May 18; filed, May 23; cost $8057.

Hyde and Geary. Excavations, concrete, brick and marble work; owner, Mrs. P. Rosenweig; architect, Salfield & Kohlberg; contractor, Crawford Ferris; signed, May 16; filed, May 23; cost $1523.

Hyde and Geary. Plumbing, etc.; owner, Mrs. P. Rosenweig; architects, Salfield & Kohlberg; contractors, Gullick & Wetherbeen; signed, May 16; filed, May 23; cost $1877.

Jackson and Jones. Three-story frame; owner, Mrs. Jane Trubody; architect, Clyde Corrigan; contractor, E. P. Stone; signed, May 28; filed, June 2; cost $4916.

Kansas near 24th. One-story frame; owner and builder, J. Winstron; cost $1500.

Kentucky near Sierra. Additional story; owners, Claus and Jochim Sass; architect, H. Geilfuss; contractor, C. Krecker; signed, May 19; filed, May 19; cost $1940.

Market near 4th. Brick work for three-story brick; owner, Claus Spreckels, architects, Reid Bros.; contractors, Rae Building and Contracting Co.; signed, May 19; filed, June 1; cost $14 per M for bricks actually laid.

Market near 4th. Carpenter work; owner, Claus Spreckels; architects, Reid Bros.; contractors, Thomas Day & Sons; cost $4515.

Market near 4th. Carpenter work; owner, Claus Spreckels; architects, Reid Bros.; contractors, Thomas Day & Sons; cost $4515.

Market street at Ferry Depot. Frame building for Post-office; owner, State of California; contractors, Healy, Tibbets & Co.; cost $4938.

Market near 16th. Two-story frame and shop; owner, W. E. Dubois; cost $6000.

Market and 3d. Brick work; owner, Claus Spreckels; architects, Reid Bros.; contractor, John McCarthy; signed, May 8; filed, May 22; cost $19,136.

Masonic Ave. near Page. Alterations and additions; owner, Rev. W. Kerby; architect, T. J. Welsh; contractor, Frank Doyeu; signed, May 23; filed, May 26; cost $1075.

McAllister and Baker. Alteration and additions; owner, Owen McHugh; architect, C. J. I. Devlin; contractor, F. W. Knight; signed, May 9; filed, May 13; cost $2350.

Mission near 7th. Mason work on three-story brick; owner, J. Noonan; architect, P. J. Donahoe; contractor, L. C. Schroeder; signed, May 26; filed, May 27; cost $4000.

Mission near 7th. Carpenter work, etc.; owner, J. Noonan; architect, P. J. Donahue; contractor, John Miron; signed, May 27; filed, May 27; cost $1300.

Mission near 3d. Alterations and additions to Howard Presbyterian Church; superintendents, Mahoney Bros.; cost $25,000.

Napa and Georgia. Carpentry, mill work, etc.; owner, Union Iron Works; architects, Percy & Hamilton; contractor, F. W. Kern; filed, May 28; cost $10,344.

Napa and Georgia. Brick and cement work; owner, Union Iron Works; architects, Percy & Hamilton; contractors, McCall, Miller & Beck; filed, May 28; cost $8450.

Napa and Georgia. Concrete, etc.; owner, Union Iron Works; architects, Percy & Hamilton; contractors, Keatinge, Leonard & Ransome; filed, May 28; cost $3590.

New City Hall Dome. Finishing work; owner, City of San Francisco; architect, Frank T. Shea; contractor, San Francisco Novelty Works; cost $83,311.46. Marble work; contractor, California Travatine Co.; cost $16,584. Grand stairway; contractor, W. H. McCormick; cost $3351.60. Marble work for 2d gallery; contractor, W. H. McCormick; cost $4156.80. Plain glass; contractor, F. N. Woods & Co.; cost $900. Elevator; contractor, Cahill & Hall; cost $3075.

Oak near Devisadero. To build; owner, Theresa McKenna; contractor, T. F. Mitchell; signed, June 2; filed, June 8. cost $3430.

Park Ave. near Broderick. To build; owner, Annie Clark; architects, Herman & Swain; contractors, Anderson & Greig; signed, May 21; filed, May 21; cost $3000.

Pine near Dupont. One-story brick; owner, Mr. Tietjen; architect, E. Depierre; contractor, Miller; cost $1500.

Point Lobos near 18th Ave. Cottage; owner, Mr. Wagner; contractor, C. Knutte cost $800.

Polk and Ellis. Additions; owner, E. Bruck; architect, E. J. Vogel; contractor, I. W. Coburn; signed, May 26; filed, May 27; cost $2650.

Post near Taylor. Additions; owner, Mrs. Maggie J. Hemphill; architectst McDougall & Son; contractor, J. H. McKay; signed, May 9; filed, May 9; cos, $2715.

Post street, No. 103-109. Alterations and additions; owners, Kohlberg, Strauss & Froham; architects, Salfield & Kohlberg; signed, May 29; filed, June 2; cost $1400.

Quincy near California. A new brick building and alterations to old; owner, G. Garrsler; architect, E. Depierre; contractor, J. E. Dnuphy; signed, May 29; filed, June 1; cost $2350.

Sacramento and Webster. Plumbing and gas fitting; owner, J. H. Jellett; architects, Salfield & Kohlberg; contractors, Welsh & McCusker; signed, May 27; filed, May 29; cost $1540.

Sacramento near Broderick. Reconstructions; owner, John H. Boardman; architect, W. H. Wharff; contractors, Hood & Watson; cost $850.

Second near Howard. Two-story brick; owners, San Francisco Breweries; architects, Smith & Freeman; contractors, Mahoney Bros.; cost $10,000.

Seventeenth near Noe. Additions; owner, Jas. Hallihan; architect, T. J. Welsh; contractor, Neil Mallory; signed, June 1; filed, June 2; cost $1275;

Sixth street No. 23. Alterations and additions; owner, Nellie J. Hinricks; architect, A. J. Burnett; contractor, T. D. Gilmore; signed, June 1; filed, June 1; cost $2200.

Sixteenth and Folsom. Three-story hotel; owner, John Center; superintendent, N. R. Ellis; days work; cost $18,000.

Stockton near Sutter. Two-story brick; owner, Geo. H. Sanders; architect, G. H. Sanders; mason work R. Beattie; cost $4500.

Sutter and Hyde. Carpentry, mill work, etc, on five-story and basement brick; owner, Dr. J. Rosenstern; architects, Salfield & Kohlberg; contractors, Campbell & Pettus; signed, May 9; filed, May 13; cost $25,450.

Sutter and Hyde. Excavations and concrete; owner, Dr. Julius Rosenstern; architects, Salfield & Kohlberg; contractor, S. Giletti; signed, May 9; filed, May 9; cost $8245.

Sutter and Hyde. Plumbing and gas fitting, etc; owner, Dr. J. Rosentern; architects, Salfield & Kohlberg; contractors, I. Ickelheimer & Bros.; signed, May 16; filed, June 4; cost $12,000.

Sutter and Hyde. Brick works, etc.; owner, Dr. J. Rosentirn; architects, Salfield & Kohlberg; contractor, S. Giletti; signed, May 22; filed, May 2; cost $17,975.

Tenth Ave. near California. To build; owner, John & Margaret Neuenberg; contractor, August Guilbert, signed, May 11; filed, May 12; cost $2200.

Twenty-first near Protrero. To build; owners, Braida & Pasquali; contractor, J. Macconi; cost $1600.

Twenty-second near Shotwell. One-story brick; owner, J. P. Marasson; architect, G. A. Berger; contractor, J. B. Pene; signed, May 15; filed, May 19; cost $1430;

Twenty-second Ave. and Lake. Two-story frame; owner, A. L. Bowhay; architect, H. D. Mitchell; cost $10,000.

Twenty-fourth near Kansas. Too frame dwellings; owner and builder, F. Nelson; cost $4000.

Twenty-fifth and Florida. Three-story frame; owner, F. V. Pistolesi; contractors, M. A. Steward, L. L. Berger; signed, June 1; filed, June 1; cost $2216.

Twenty-seventh near Guerrero. To build; owner, J. M. Burk; cost $4000.

Turk near Fillmore. To build; owner, Mrs. M. T. Welsh; architect, T. J. Welsh; contractors, Williams & Foster; signed May 29; filed, June 1; cost $4750.

Van Ness Ave. and Clay. Steel and copper plated blinds; owner, Claus Spreckels; contractor, James J. Wilson; signed, May 6; filed, May 22; cost $7250.

Van Ness and Clay. Elevator work; owner, Claus Spreckels; architects, Reid Bros.; contractors, Cahill & Hall; signed, May 23; filed, June 3; cost $2950.

Vermont near 25th. Seven frame dwellings; owner and builder, F. Nelson; cost $14,000.

Waller near Masonic Ave. Four two-story frames; owner, W. Whealan; day-work; cost $20,000.

Washington near Leavenworth. Concrete, Brickwork, etc.; owner, Charles D. Cushing; architect, J. H. Littlefield; contractor, H. H. Larsen; signed, May 10; filed, May 20; cost $1474.

EXISTING POST-OFFICE BUILDING AT SAN FRANCISCO, CALIFORNIA.

PREMISES OF NEW SAN FRANCISCO POST-OFFICE, AUTHORIZED BY ACT OF CONGRESS, MARCH, 1887.

E PUBLISHED last month a clipping from *The Age of Steel*, setting forth at some length, the greater desirability of the present *competitive system* of society, as contrasted with the results which it predicts would occur, should the people ever attempt the *co-operative system* advocated by Socialists.

In order to give our readers food for thought, we will give Socialism (the under dog in the economic, as well as the political fight to-day) a chance to answer the statements made by *The Age of Steel*.

To begin with, *The Age of Steel* in asserting that Socialism is a beautiful theory that "*goes to pieces in actually operation*," has no actual basis of fact on which to rest its assertion. Socialism has never been tried that we ever heard of by a modern civilized government individual efforts at co-operation are not in any sense of the word, Socialism.

Until this trial has been made by a *government* and *failed*,

a Socialist cannot be made to understand why his ideal is "impossible of realizing" and "impossible of maintaining," when realized. On the contrary, he argues with some degree of plausibility, that if the government can successfully conduct the mail service, it could also conduct an express service and a freight service; and that if it is a proper function of the government to conduct a mail service, there can be no logical argument advanced why the government should not conduct an express and a freight service. Once grant that it is right for the government to own and conduct the telegraph (as is done in England) or to own and conduct the railroads (as is done in Germany and a dozen other countries) or to run a pawn-shop (as in done by the Municipal government of Paris,) how can it be denied that the government could, on equal grounds of expediency and justice, own water works, supply gas and electricity and run a bakery? and when the present functions of the government (which are universally acknowledged to be legitimate and desirable and effective) have been extended to embrace all those means of production and distribution of life's necessities that still remain under the control of individualistic or corporate enterprise, then the era that Socialists are striving to bring about, will be practically achieved—the government now erects structures not oniy for the accomodation of the public, for the transaction of Municipal, State and National business, but also at the public expense cares for the sick, the wounded, the insane, the paupers and the criminals. Socialists claim that it would be only one step more in the line of present tendencies, to add to the functions of government the care of the *unemployed*. In other words direct their energies into productive channels, or apply their unoccupied time, first in all ways *useful* to the community, and when all utilitarian avenues have been supplied, then to those productive of public pleasure and recreation; such as the building and maintaining of public parks, museums, memorials, the cultivation of desert places, the ornamentation of public roads and pleasure grounds, national boulevards, etc., etc.

To simply assert that a dream is impossible of fulfillment, is not a valid argument against that dream unless reasons are adduced in support of the assertion.

Napoleon did not chose his Marshals because they were fond of telling him his plans were *impossible*. To a Socialist the fact that Society manages to exist at all under the competitive system, is the strongest kind of an argument that it would florish more vigorously still under a co-operative system.

A Socialist when confronted with the argument that the "fittest must survive" might pertinently ask why a garden is cleared of weeds; if it be true that the fittest must survive, without regard to usefulness to mankind, then why not let the plants fight it out with the weeds, relying on the fact that the fittest must survive, and calm in the consciousness that nature does all things well, and that if the weeds conquer (as they probably would) therefore it is best they should, being the "fittest to survive."

It is no doubt true that among the nations of the East such things as "honesty, fair dealing and frankness" are looked upon as irridescent dreams. But to claim that the ordinary business man of to-day is "a shinging example to the contrary" is to claim just a little too much.

The president of a powerful railroad corporation in this country, stated in public only a few years ago, that while he had every confidence in the truth, honesty and integrity of the word of the presidents of rival corporations when spoken by them as private individuals, *yet he would not trust one of them to tell the truth in a business transaction.*

The Age of Steel seems to be willing to admit that this competition is at times *ruthless and grinding*, but thinks it far less cruel than nature.

This statement might be questioned. Is a lingering death by starvation under the horrors of the blacklist any better than the quick sharp death that nature's beasts of prey inflict on their victims? certainly it is not much, if any, improvement.

A Socialist will hardly admit that much courteous and kindly feeling existed between the Standard Oil Company and the rivals it drove from the field, or much honesty and frankness in business methods that tolerate adulteration in all its forms, even in the food that gives us life.

IN THE PROGRESS made in the flooring of public buildings within the last few years the old fir and cement floors have given place to floors of more expensive character; oak and other hard woods, encaustic tiles, marble and mosaic. It becomes then a necessity to keep these free from stains if one wishes to enjoy their beauty. The trustees of Alameda have come to this conclusion—and have passed an ordinance making it a misdemeanor to expectorate upon the floors of public buildings or in public conveyances—thus keeping up the reputation already gained by them in acquiring their own electric light plant, as the most progressive public body in their vicinity.

It is high time that action on the same lines should be taken in all other communities; why should one be allowed to damage the floors of other people's property, any more than he is allowed to damage the walls by chipping or other means—this is looking at the matter of dollars, but besides that the senses of people of taste deserve some respect, which cannot now be said to be the case, as long as one has to pick one's way on the street, sidewalks and pavements of buildings amidst the spots and splashes of putrescent and tobacconesque matter. One look at the floor and steps of San Francisco's City Hall, with its evil looking decorations, is sufficient to show at once the necessity of a similar ordinance in this City.

A MODEL "FAKE" CAPITOL COMPETITION.

APROPOS to the seeming epidemic of "invitations to architects" just now, and which seem to be accepted with alacrity, is that recently issued by the State of Mississippi for a new capitol building. The general scheme is so attractive that the express business in the South should be greatly stimulated. On July 15 the committee, consisting of the Governor, Attorney-General and Secretary of State, will "meet for the purpose of collecting all plans and information obtained by them," and at that time will be pleased to confer with such architects as may prefer to visit the capital city. As the building is to cost from $550,000 to $1,000,000, and a sum not to exceed $1,000 is to be paid for the plans, or in case the architect is employed to superintend, no compensation shall be paid for plans and specifications, and in no case shall there be any compensation for plans not used, this should be an exceptional opportunity to prove the cheapness of an architect's service. The assurance that the committee will be assisted by a competent and disinterested architect to collate all plans and information that would be useful to the legislature in letting the contract should lend additional attraction to this most unique "invitation." We were wont in times past to point out to these misguided committees that respectable architects would not compete under such conditions, but recent events in the competition line have so far modified this opinion that we would not be surprised to see a long list of competitors for the state capitol building for Mississippi.—*The Inland Architect and News Record.*

THE NEW RULES AND REGULATIONS OF THE SAN FRANCISCO BOARD OF HEALTH.

WE HAVE received the Rules and Regulation adopted by the Board of Health of San Francisco, taking effect July 1, 1896, in place of those heretofore in force. The words and grammar are hardly commendable and there are a few ambiguities, *e. g.*, in Section 10—"The sewer shall have a trap placed either at the line of curb of sidewalks, or immediately inside the area wall under sidewalk"—"at the line of curb of sidewalks" may mean in the gutter of the street, in the curb itself, or in the sidewalk at the inner line of curb, may be all are intended.

"Sec. 26. (Surface Drainage)—No opening shall be provided in the sewer pipe of any building for the purpose of surface drainage unless said opening is properly trapped and supplied with water from a suitable fixture."

"Suitable fixture" is very vague—a definition of a suitable fixture is required—then it says:

"When said surface drain is situated at a distance greater than twenty feet, reckoning in a horizontal line from said suitable fixture, than it may be supplied by a hose-bibb."

It does not say where the hose-bibb shall be, whether standing up in the middle of the yard, over the trap, or twenty feet off. From information we find that the hose-bibb may be twenty feet off as long as the water from it is conducted either with a hose or gully in the pavement to the surface trap. But if the trap is 19'6" from a "suitable fixture" it must be supplied from the "suitable fixture," but in what way we know not and the regulations do not help us out.

When in Sec. 29 it says that "branches must be connected to main vent at an angle not *less* than forty-five degrees." Surely it must mean *more*.

In Sec. 31 where it says that "the branch fitting must be 3'6" from *the floor line*" we would suggest from *the fixture*, as floor line is an indefinite statement.

In Sec. 33 "Every vertical soil, waste or vent pipe must extend full bore two feet above the highest line of roof or coping" should be qualified by "at the intersection of said pipe with said roof or coping"—as it reads now a plumber might be compelled to run his vent pipe two feet above the ridge of the roof which is the "highest line of roof" instead of two feet above the place that the pipe protrudes through the roof.

No distinction is made between a "vent" and a "vent-pipe"—which leads in some cases to confusion, the term vent is generally used for both.

We will stop here or we may be considered hypercritical.

PROFESSIONAL GRADUATES.

AT this season of the year, when our professional schools are launching on the community multitudes of young men who have completed the school course in their preparation for the professions, one is disposed to ask, is all this material needed in keeping up the requisite strength to serve the public in professional lines? While we are disposed to apply it to one profession, is it equally pertinent in the case of the lawyer, the doctor and other similar callings. The world has a great capacity for absorbing material of this sort. In fact, we find that professional study very very often is the step to positions outside the regular lines of practice which the course of study of the school specially points to, yet for which it fits them to a nicety. Graduates of medical schools become chemists or pursue special lines, never, perhaps, touching the regular line of practice. Lawyers become associated with great business enterprises, for which their legal training especially fits them. Examples of such change of work are constantly before us. Take, for example, President Depew of the great New York Central and its immense system. Who can doubt that his training as a lawyer has stood him in good stead in handling and systematizing the business of these roads?

In viewing the exhibition of the Columbia School of Architecture the other day, the value of the training there afforded struck the writer as being of far wider scope than is generally supposed. And to come back to the question of how all these young fellows that are going out from this and similiar institutions are to be employed in architecture, we answer, they don't need to be. There is a broad field for the employment of men who have received this class of training outside of mere building. Architecture may be regarded as a fundamental art. In fact the study of its history shows that all the other arts have grown out of it, however widely separated they may have in time become. So that like classics in literature, and as their study is needful to broad literary culture, thus the study of architecture, its forms and proportions, is the fundamental work in any broad school of design. Recognizing this feature of architectural school work, one can easily see the broad field open to these graduates.

The vast need of able designers is felt in every branch of manufacture that rises at all above the plane of utilitarianism. Intelligent and traveled Americans have long recognized that there was something that made many articles of manufacture from the Continent, in many cases at least, better than ours, and that not found in the value of material or construction, but in the better proportion, the more apt use of color, or in all those directions which are influenced by what we call taste. It is no disparagement to our people to say these things. Americans have been too busy erecting

the material structure of a nation and furnishing the needs of a new people to have had time to dwell on the æsthetic character of their work. Here, however, is where the work of our architectural schools comes in. Any one who looks upon them as the breeding places only of master builders falls far short of a recognition of what they are doing. Their work is to train the minds of young men in the study of design as they teach them to develop their construction in that artistic manner which we call architecture. All design is closly allied, and the same character of ornament may be seen on a terra cotta vase or a silver goblet that appears in a classic frieze, and be equally appropriate in either case. So that in a measure a graduate of an architectural school has gone through a class of training that fits him for all manner of technical design. It is true he has not received that technical knowledge of material or appliance that may be necessary for the execution of his design, but he soon comes to it. His training has all along been such as to exercise his invent ve faculties, and has cultivated a quick comprehension of the circumstances surrounding him and the materials with which he has to work. Here the young architect's training differs from the artist's. The latter can, to a certain extent, create his own surroundings and bring them into harmony withhis own ideals, while the architect must bring his art ideas into harmony with his surroundings; he is confined to limits and bounds beyond which he cannot go, and "to construct beautifully" within the limits of the conditions surrounding him must often tax severely his genius. It is this very circumstance that makes architectural study an especially good introduction to all classes of technical design. In both cases a high degree of mechanical comprehension is required. The architect must understand the limitations of his site, the characteristics of his materials—stone, brick, wood or whatever they may be—and mould them into artistic form, all the time preserving the highest quality of usefulness and commodiousness in the structure. Like conditions govern the designer of carpets, oil cloths and fabrics of all sorts, and the conditions of manufacture and the character of materials have all to be intimately known and carefully considered, otherwise the design is a failure.

Viewed in this light the opportunities of these schools are great, and their influence must be far-reaching and to the benefit of students not only in reference to building, but to every class of industrial pursuit. Besides, they are training schools of our art educators, and their graduates may be found in all the schools for art-artisans throughout the country. These schools are thus centres of artistic growth for the whole country.—*Architecture and Building.*

AN IMPROVEMENT IN WALL FINISHES.

THERE is no one feature in the house which is more constantly before the eye than wall finish, none which appeal more strongly to artistic taste, with the exception perhaps of plumbing, none has a greater hygienic importance, and no other feature has so often to be replaced. The three methods in use of finishing walls, water colors, *i. e.*, kalsomining and frescoing, wall paper and oil paint each have their objectionable features.

All ordinary kalsomines of fresco paints get their adhesive qualities from glue, which being animal matter, in time decays, emites foul and unhealthy odors and causes the finish to crack and chip off. All such finishes are porous and absorptive, and naturally attract and retain disease germs. Not one of them can be washed when soiled and if a leak comes through the wall or a spot gets on them, there is only one way to repair the damage and that is by going over the entire wall again.

Wall Paper is porous and absorption; it is applied with a vegetable paste which becomes food for vermin; it is quickly ruined by dampness and stains, and is expensive.

Oil Paint which is permanent, non-absorptive and washable soon turns yellow when used on interior walls; it intensifies cracks and other defects in the wall and requires four or more coats to make a solid finish, making it expensive. Its gloss which it is impossible to entirely kill, gives the wall a greasy effect, and last, it is not possible to produce with it the delicate shades and soft velvety color effects so admirable in water colors.

It would seem therefore a wall finish which possesses none of these objections should be welcome both to the house-owner and architect. It can be found in Zinolith a California product.

CORRESPONDENCE

[The Editor is not responsible for anything which appears in this column.]

To the Editor of the California Architect and Building News.

SIR:—I have had presented to me a copy of the New Rules and Regulations of the Board of Health of San Francisco, and being interested in what concerns the welfare of the people, it struck me that one part of them at least might be open to criticism. I believe there is incorporated in them a very undesirable principle when they compel a master plumber before he is allowed to register to give "a bond to the State of California for $500 with good and sufficient sureties, for the faithful discharge of his duties as master plumber."

This is a special law and unconstitutional, why should a plumber give bonds more than a doctor, architect, house mover or builder, these have the health and welfare of the citizens as much in their hands as the plumber. If one tradesman is to give bonds, start in fair and make every business man, tradesman and professional man give bonds for the faithful discharge of their duties—for all businesses when improperly carried out are dangerous to the public welfare. How many bodies do incompetent doctors kill off without bonds. How many souls do incompetent divines send to damnation without bonds. How many lives are wasted in badly lighted, badly ventilated abodes and otherwise destroyed by incompetent architects and builders without bonds. How many people are poisoned by adulterated goods sold to them by traders without bonds. Let everybody give bonds *if bonds are the go*, either all bonds or no bonds to be consistent.

The President of the United States is about to issue another batch of bonds, so the Board of Health is evidently in the fashion, and bond servant will be a term quite in vogue, even more so than in Abrahamic times.

But the poor plumber has not only to give bonds but has also to pony up one dollar for his certificate every year. He has also to have an established place of business in San Francisco, so that the plumber over the San Mateo line or in Oakland, San Rafael or other adjacent towns may not come over to San Francisco to do work for his friend. Why this is worse bigotry than the whilom charter-makers of San Francisco wish to foist upon us when they would like us to be compelled to take all our school teachers from California.

These attacks on the liberty of the individual must be stopped or where shall we land?

When a plumber passes his examination and is declared competent—if that examination is honestly conducted as is the presumption—then he becomes a worthy master plumber and the asking him to put himself under obligation to obtain bonds appears very much like an insult.

Yours truly, STROLLER.

PROPOSED FOREST RESERVE IN MINNESOTA.

AFTER the most unparalleled destruction of property and of life by forest fires in Minnesota less than two years ago it is hardly to be wondered at that the new law against these fires in that state is the most effective of all that have been enacted in the various states of the Union. But the advocates of sound forest policy in Minnesota have not rested here, they are making a determined move toward acquiring, in the name of the state, a large area on which it is proposed to restore and preserve the forest. We have received a circular containing a synopsis of the plan proposed by Mr. Judson N. Cross, of Minneapolis, at the meeting of the Forestry Association of Minnesota, held in January of this year, and since the plan is novel and has far-reaching possibilities, all persons to whom the circular is sent are requested to express their opinions as to the details and to send any recommendations for changes, together with reasons for the same, to the Secretary of the Association, Mr. J. O. Barrett, Brown's Valley, Minnesota.

The plan is essentially this: (1) The Legislature is to constitute state, county and town boards of forestry. For the sake of economy the town board of supervisors will act as a town forestry board, the county commissioners will constitute the county forestry boards, and the state forestry board of nine members is made up of the State Land Commissioner, the Professor of Botany in the Agricultural Department of the State University, the chief officer of the Climate and Crop Service of the United States Weather Bureau in Minnesota, and one member appointed by each of the following associations, namely, the State Forestry Association, Farmers' Institute, the Board of Regents of the University; the State Lumbermen's Association, the Board of Public Health and the Fish and Game Commissioners. These are to serve without pay, except for actual expenses, and an executive committee of three is to be selected by the entire board. (2) Owners of Pine lands which have been lumbered over and other lands, especially if they are rocky, rough or sandy, and will probably not be utilized for agricultural surposes for some years, may deed that land to the state when this course is recommended by the town and county forestry boards. This land is deeded for forestry purposes only, all rights in minerals, coal, oil, etc., being reserved. Land so deeded shall be exempt from taxes, because it is dedicated to public use. (3) This land shall be called the Reserved Forest Area, and it shall be under the charge of the State Forestry Board, who is to care for it as the Legislature may direct. (4) Of the future income to be derived from such lands, one-third shall go to the state to reimburse it and the towns and counties for care and protection and loss of taxes, one-third to the person deeding the land and his heirs for a period of, say, one hundred years, after which it is to go to some institution, the other one-third to go to some designated institution or the State University. (5) The state shall have full power to lease low meadow tracts where such are needed as protection against fire, or for pasture where this will not interfere with the growth of the forest-trees. It shall have power also to sell dead and down timber, which it is supposed when the adjoining lands are settled up will bring in a large income, and generally the state is to have full power of control, even the power of alienation of certain tracts when recommended by the State Board of Forestry in such cases, for example, as where the growth of towns, the building of railroads, water-power, etc., may necessitate such alienation.

Of course, this is the merest outline of the scheme, and we have omitted many of the details given in the circular. We call attention to it, however, as a step forward, that the great prairie states, as well as New York and those in the middle Appalachian region, are taking serious thought of securing and maintaining large areas in permanent forest. Experience in Europe and in India has demonstrated that such areas owned by the commonwealth will prove a source of revenue if properly managed. Besides, they will furnish examples which private forest-owners will be eager to follow. More than all, a community which is sufficiently farsighted to take such action will see to it that the heights and slopes which are the sources of water-supply to the valleys below are kept covered forever as the only security against those disasters which the reckless destruction of forests on highland or lowland has invariably brought.—*Garden and Forest.*

THE BISHOP PAID THE BILL.

THE principle of charging for the "know-how" is not forgotten by professional men who have got on well in their work. The story is told in an English book of a distinguished Bishop, who, being dissatisfied with the arrangements of his palace, employed a first-class architect to superintend possible alterations. The architect took time to consider, and at last submitted plans. By this time the Bishop had decided that the cost was too great, and relinquished his building project altogether.

"And now said the Bishop, "I shall be glad if you will tell me how much I shall pay you for your trouble."

"I thank your lordship, £100," answered the architect.

"One hundred pounds!" exclaimed the Bishop. "Why, I have curates in my diocese who do not receive so much as that for a whole year's services."

"That may be true, my lord," said the architect, "but I happen to be a Bishop in my profession!" There was nothing more to be said, and the Bishop paid the bill.—*Youth's Companion.*

ARCHITECTURAL COMPETITION.

AT the closing meeting of the Boston Society of Architects for the session, held May 8, much of the evening was given up to a discussion of the matter of competitions, which was introduced by the following paper which was read by Mr. John A. Fox:—

The treatment of this subject, one of the vital issues of our practice to-day, must depend largely upon the precise nature of our calling. Is it, in the future, to be an art, a profession or a business? At present it has characteristics of all these. But we live in an age of reforms and in a nation of progressive tendencies. Our part of the world's work must advance or lag behind. What are our young men going to make of their chosen occupation? An art, pure and simple, it cannot be. It is too intimately connected with practical matters, and can only be followed exclusively as an art by the subordination of the designer to the engineer, or the man of business. None of us would counsel such degradation. If it is to be a business, the standard will of course be low enough to include all the weak, the lazy, the incompetent and the unscrupulous; and the decay of art, science and morals in our practice will be rapid and complete. All societies and rules will become superfluous, except such as belong to "trades-unions" or "trusts," and are created merely to increase profits. No laws will be needed but the "common law"; and the only incentive to, or test of, success will be the greatest return of income.

The tendency of the times is to measure everything by a money standard. The age is feverish with rivalry, envy and discontent. But we note the fact, while the methods of business and politics seem to be steadity deteriorating, three callings, the church, medicine and law, though somewhat partaking of the current demoralization, still maintain educational and ethical tests and standards, and guard their patrons by examinations and legal certificates. The clergyman, the doctor and the lawyer, with no less love than others for the ease and comfort that money may bring, still look for a part of their reward in the social standing given by their professional position and in the consciousness of intellectual work well done.

Assuming, then, that our choice is to make the practice of architecture a suitable profession for educated gentlemen, what are we to do to prevent the field from being invaded, our standards lowered and the public defrauded by the unqualified and the dishonest.

This brings us to the main problem. Where do we find, in other professions, any system of employment like that known to us as "a competition"—even as seen at its best? and what is there peculiar in our work that demands this form of "trial by battle?" We are considering mainly "public" or "open competitions." What are known as "limited" ones are of minor importance. If a promoter elects to pay adequate prices for the sketches of several architects, though the practice is not a businesslike one for him, or a dignified one for the architects, except under conditions that seldom prevail, yet it may not merit the condemnation called for by the other.

But in the open contest, with all its variations and complications, real artistic feeling and sentiment are thrown to the winds and we have an attempt to select an architect by choosing from a set of sketches one that seems to the promoters, or at best to their adviser, to meet the imperfectly expressed requirements. The party offering the sketch is not known to be its author, or even to be an architect at all. His purpose is at war with the nominal one, for he aims only to secure a premium, or a commission; whereas the promoters wish to employ a competent professional adviser and to secure a thoroughly good and beautiful building—two very different objects.

Perhaps I am not drifting too much into the burlesque, which the absurdity of the situation seems to suggest, in drawing a comparison with another profession. Suppose that one's wife suffers under the affliction of a malignant tumor. The husband wishes the most thorough relief for her, consistent with his limited means. He calls in half-a-dozen physicians and a few medical students, and if very liberally inclined, invites an extra doctor to advise with him. The invited competitors, after being furnished with some general facts in the case, proceed, in the absence of the patient, to illustrate in a sketchy way, and perhaps with aid of a carving-knife and a loaf of bread, how each would treat the case, and to the one who makes the most attractive showing the wife's fate is intrusted. Does this seem a forced comparison, and do you object that the surgeon deals with life and death? If so, what do you count the dignity of a profession that favors "competition," for the most complicated building problem, among draughtsmen and office-boys; and puts its veteran experts on a level with unqualified charlatans? The doctor deals with life and death! What are our dealings with? Pictures? Are there no far-reaching results affecting the health and comfort of thousands? their education in what is lovely, and even their moral welfare, in the design and construction of every important building? Would you select a man to design a national monument, and to expend millions, as you would buy a chromo or a carpet? Few architects accumulate money enough to build extensively; but, if by chance one did, he would surely ignor his own prescription.

Here seems to be the root of the evil. Our methods tend to land our employers, who are ever too ready to adopt superficial views of expert service and with a natural selfishness to undervalue it and give ear to the counsels of quacks, to mistake the shadow for the substance. How easily they could be set right by our united efforts.

We all know that success in competitions implies the possession of faculties and the adoption of methods entirely foreign to the true purpose of building design as a creative art and science. It is well understood that an office organized for success in this unreal and speculative department is less fitted for the legitimate service of clients. The working-plans are often careless in execution, deficient in number and inaccurate. Competition in merit leads to competition in rates of commission and to direct solicitation of work. More work is undertaken than can possibly receive the attention of the chiefs, and professional methods give way to those of syndicates and combinations. The draughtsmen, forced into the rooms of dull routine, lose their interest in their work; do it in a mechanical way; and are deprived of their educational rights. This leads them to settle down into mere machine workmen, or to look for their emancipation to some happy venture, for the successful conduct of which their training has utterly unfitted them. From these temptations and influences follow the various minor irregularities, dissensions and heart-burnings of our professional lives.

It is a matter of record that an open competition seldom

results in the selection of the best architect or the best design. The technical journals have been filled for many years with the history of failures of the system, and the war of words sure to follow the vain attempts at regulation. And more than all we have repeated and reliable accounts of successes gained in this manner by men not architects in any proper sense and by the use of means that would discredit them in mercantile ventures, even as judged by the low moral standards of modern business.

In view of all this, and more of the same sort, it becomes us to inquire who is responsible for the system and its abuses. Not the public. The general desire of promoters is to have the best building. No clear-headed business man would, on his own motion, think of reaching such a result in such a manner. He does not hire his lawyer or doctor in any such foolish fashion. If he is a sharper, he might try to obtain gratuitous service by some irregular contest; never through (so-called) fair competition. The people learn our ways, good or bad, from our technical journals, the publications of our societies and from intercourse with our individual members. They institute competitions because they are advised so to do by those whose personal interests are forwarded by such methods, or by those who honestly believe that they cannot exist without them. When we announce that an architect's abilities can be measured by an expert, or even by an expert consideration of a sketch, is it strange that the public come to consider his employment as a simple matter? What wonder that so childish a calling becomes a prey to the hard-headed and hard-working engineer, the glib sanitarian, or the enterprising upholsterer! "The fault is not in our stars but in ourselves that we are underlings."

The outlook, however, is improving. When hoary abuses reach the danger-line, it is an American custom to sweep them away. They are marked indications that a large and increasing body of practitioners, including many of the younger architects, are determined to regulate the competition system. Failing in this, their good sense may be relied upon to abolish it. It is an indirect tax on the whole body for the benefit of the few, and no less a tax because indirect. The comparison drawn with works of sculpture and painting is nothing to the purpose. In these the presentation for selection is the thing itself, or something from which a fair estimate of merit can be made. The fact that something of the sort is claimed to bring good results in foreign practice proves nothing. It may suit the Gallic or Teutonic temperament to do serious work under such conditions. The English have nothing favorable to show us. I could weary you with a list of their failures to regulate, and could quote many of their best and ablest men against the practice in any form. But even they have excuses that we have not in their stubborn adherence to precedent, good or bad, and in the restrictions of their social orders which prevent the advance or promotion of men of talent without position or influence. But we have outgrown the provincial habit of commending everything foreign, and why waste your time with the Old World's record of disgrace, dishonor and loss. Have we not American State-houses and court-houses and city-halls?

It is impossible to show by any reliable statistics the relation of expense to return in competitions, or the incidental losses which come through interference with regular work. But, judging from cases where such results can be estimated, there is no doubt that the accumulated cost far exeeds the sum of the gains. It is still harder to compute the physical and mental wear and tear of such needless excitement and anxiety on a class of men ordinarily subjected to the weight of heavy responsibilities and to the enervating effects of sedentary occupation. The time given to effectual rivalry is sadly needed for the professional study that should never be neglected, and in perfecting work in hand, which fails with us more from lack of thoughtful and careful treatment than from any other one cause. Competition brings out qualities of American practice and American architecture that we should exert our utmost efforts to avoid; such qualities as unreality, superficiality, caprice and extravagance (in design), irresponsibility, favoritism, intrigue, jobbery and speculation. Surely a dangerous array of faults to receive the encouragement of a profession of educated gentlement.—*The American Architect and Building New.*

CELERY FOR RHEUMATISM.

A medical authority says celery is a cure for rheumatism, and asserts that the disease is impossible if the vegetable be cooked and freely eaten. The fact that it is almost always put on the table raw prevents its therapeutic powers from becoming known. The celery should be cut into bits, boiled in water until soft, and the water drunk by the patient. Put new milk, with a little flour and nutmeg, into a saucepan with the boiled celery, serve it warm with pieces of toast, eat it with potatoes, and the painful ailment will soon yield. Such is the declaration of a physician who claims to have tried the experiment with uniform success. He adds that cold or damp never produces, but simply develops, the disease, of which acid blood is the primary and sustaining cause, and that while the blood is alkaline there can be neither rheumatism or gout. English statistics show that in 1 year (1876) 3640 persons died of rheumatism, which might have been cured or prevented by the adoption of the remedy mentioned. At least two-thirds of the cases named heart disease are ascribed to rheumatism and its agonizing ally, gout.—*Mining and Scientific Press.*

ELECTRICAL HARDENING OF STEEL.

A FRENCH technical journal anounces a new invention in the field of electrical metallurgy. It is a process which will give an extraordinary hardness to steel. It is reported that the inventor, a Mr. Taux, has executed the following experiments before a committee of engineers at Strasburg. A drill hardened by electricity pierced a shell twice as quick as a drill of the best steel hardened in the ordinary way. The drill was closely examined afterwards by means of a strong microscope and not the least injury could be discovered. An electrical hardened circular saw cut iron bars with surprising ease. With a cold chisel similarly treated a steel bar, one by one-half inch, was cut through and the operation was repeated five time on the same bar. Then a cast-steel plate, one-quarter inch thick, was cut with the chisel, the edge of which showed neither a fissure nor any other alteration afterwards. An electrically hardened table knife cut iron wire of one-eight inch diameter just as easy as a cotton string. The process is said to consist in the hardening of the red-hot steel objects in a conductive bath traversed by an electric current. If these tests should be confirmed by further practical experiences, the consequences would be of the greatest importance for the manufacture of tools.—*Electrical Review.*

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.
Seth Babson, Pres. W. P. Moore, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Southern California Chapter American Institute of Architects, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
Octavius Morgan, Pres. A. M. Edelman, Vice-Pres.
Arthur B. Benton, Sec'y. August Wackerbarth, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.
Geo. W. Dickie, Pres. W. G. Curtis, Vice-Pres.
Otto Von Geldern, Sec. Edward T. Schild, Treas.

Master Plumbers' Association, meets every first and third Friday of each month at the Flood Building.
Jas. E. Britt, Pres. J. L. E. Firman, Sec.

Builders' Exchange, Directors meet first Friday in each month at Mission and New Montgomery.
Oscar Lewis, Pres. Jas. A. Wilson, Sec.

Masons' and Builders' Association, meet first Friday evening of each month.
Adam Beck, Pres. M. V. Brady, Sec.

SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE regular monthly meeting of the San Francisco Chapter of the American Institute of Architects was held Friday afternoon July 10, at four o'clock.

The following members were present: Messrs. Babson, Sanders, Percy, Curlett, Pissis, Welsh, Curtis, Maybeck, and Everett.

Regent Reinstein, of the University of California, was present to confer with the Chapter concerning his scheme for a grand International Architectural Competition, to secure suitable plans for the future buildings and beautification of the University. The outline of such a competition as was drawn up by the Chapter on a previous occasion, was discussed at some length, and the desirability of future and more detailed information and advice was urged by Mr. Reinstein.

A committee of three, consisting of Messrs. Babson, Percy and Sanders, was appointed to act for the Chapter, and assist Mr. Reinstein with such advice and information as lay in their power to bestow, whenever called upon by Mr. Reinstein.

After some routine business the meeting adjourned.

A STRONG CEMENT.

A cement which will fasten stone, wood and other substances to metal, and will be entirely waterproof, has long been needed. Such an article, whose composition is a secret, is reported from Switzerland. It is a metalic composition, melts at between 450 and 500 Fahrenheit, and is then sticky like thin glue. It is said to have great adhesive power. To use it, one breaks it up in small pieces and melts it in an iron kettle. Many pretty and delicate objects can be made out of the material in plaster of Paris molds.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

A PUBLIC ESTIMATE OF ARCHITECTS' SERVICES.

THE comments of the Columbus *Dispatch* upon the refusal of certain Cincinnati architects to enter a competition for a state house is refreshing as its knowledge of an architect's services is vague. Of course, if it were a legal, instead of an architectural problem, this verdant newspaper would talk differently. Even its narrow scope of vision would see something ridiculous in the state asking written opinions from ten or more celebrated jurists and agreeing to accept and pay for the one it liked best. True, the jurist's opinion would only involve the employment of a ty pewriter lady for a few hours, while that of the architect calls for the work of skilled draftsmen for days (supposing this to be the basis of the *Dispatch's* argument when it speaks of measuring the state house with a tape line, adding a few columns of figures and calculating the utmost expenditure), and nothing to be allowed for the legal or architectural ability involved. After all, the profession is largely responsible for the estimate in which it is held regarding competitive opinions. While the legal profession has taught the public that no lawyer will open his mouth without a fee any more than you can get a piece of gum from the nickel-in-the-slot machine without shoving in the coin, the architectural profession has shown itself only too willing to take chances in the general lottery. The stand maintained by the Cincinnati architects is most commendable, and those in Columbus and elsewhere, by taking the same position, should teach the state government that architectural services mean something more than measuring the ground with a tape line.—*The Inland Architect and News Record.*

ANNUAL SUMMARY OF BUILDING OPERATIONS.

IN the following table we present the number and value of buildings erected in San Francisco during the past six months, it will be noticed there is an increase in both the number of buildings and the amount of the cost as compared with the first six months of last year.

FOR FIRST SIX MONTHS.—1896.

1896	No. of Buildings	No. of Contracts	Brick Building Value	No. of Buildings	No. of Contracts	Frame Building Value.	No. of Buildings	No. of Contracts	Alterations & Addit'ns Value.	No. of Buildings	No. of Contracts	Total Value.
Jan'ry ...	5	11	$ 40,743	34	40	$ 177,309	13	13	$ 33,153	52	64	$ 251,205
Feb'ry ...	2	7	251,925	56	60	130,778	13	13	25,605	71	80	408,306
March ...	2	6	38,082	57	63	215,372	6	6	13,500	65	75	266,954
April.....	32	49	694,417	108	120	365,687	28	28	60,796	168	197	1,120,900
May.....	2	14	235,042	30	38	146,752	39	39	24,047	71	89	406,441
June.....	10	19	221,234	93	103	460,234	17	17	70,890	120	139	748,358
Total	53	106	$1,482,041	378	422	$1,496,192	116	116	$157,991	547	644	$3,136,224

To this amount should be added the further estimated sum of $500,000 where costs have not been given, which would make the total for the first six months, $3,636,224.

FOR FIRST SIX MONTHS.—1895.

1895	No. of Buildings	No. of Contracts	Brick Building Value	No. of Buildings	No. of Contracts	Frame Building Value.	No. of Buildings	No. of Contracts	Alterations & Addit'ns Value.	No. of Buildings	No. of Contracts	Total Value.
Jan'ry ...	2	3	$ 50,025	31	33	$ 148,880	4	4	$ 20,847	37	40	$ 219,752
Feb'ry ...	7	9	59,336	38	42	122,880	6	6	12,071	51	57	194,287
March ...	6	9	170,489	76	81	208,081	8	11	17,418	90	101	395,988
April.....	7	9	163,333	57	69	274,080	24	24	87,411	88	102	466,824
May.....	3	7	36,043	85	90	385,377	19	19	33,357	107	116	468,053
June.....	2	5	74,775	67	85	288,791	11	11	24,012	80	101	385,178
Total	27	42	$ 496,001	354	400	$1,435,719	72	75	$195,362	453	517	$2,125,082

The business of the first six months for several years is shown by the following table.

1885—754	contracts	value,	$4,267,375
1886—670	"	"	2,486,633
1887—516	"	"	3,269,914
1888—437	"	"	2,719,820
1889—546	"	"	3,910,600
1890—556	"	"	3,793,858
1891—583	"	"	3,916,973
1892—411	"	"	2,942,496
1893—475	"	"	3,024,498
1894—524	"	"	2,456,424
1895—517	"	"	2,625,082
1896—644	"	"	3,636,224

THE HIGHEST BUILDING.

THE highest building in the world, not counting the Eiffel Tower and the Washington Monument, is the Cologne Cathedral. The height from the pavement to the top of the cupola is 511 feet. It is 511 feet long and 231 feet wide. It was begun August 15th in the year 1248, and was pronounced finished August 14, 1880, over six hundred years after the corner stone was laid.

BOOKS AND PERIODICALS.

THE LAW OF WAGES THE RATE AND AMOUNT by Jno. Richards, published by Industrial Publishing Company, San Francisco.

Mr. Richards is the editor of the Technical Journal *Industry* and has in this little book added to the many Theories of the Law of Wages and looks at the matter in a new and sensible light. He lays down the following four propositions or axioms as a foundation for his Theory:

First.—All manufactured articles of every kind are made up of three elements or components, namely:—material, wages and expense.

Second.—All staple articles of manufacture such as enter into the world's trade must have a nearly uniform or international value.

Third.—The *amount* of wages entering into the cost of manufactured commodities is also nearly uniform, irrespective of the *rate* of wages paid for their production.

Fourth.—The *rate* of wages depends mainly upon what workmen produce, varying with the efficiency of labor, and cost of material and expense.

Here the "amount of wages" is employed to designate that part of the cost of commodities that is paid for labor the balance being made up of cost of material and expense account the expense account meaning taxes, rent, insurance office service, advertising, lighting, heating, etc.

The term "rate of wages" is employed to designate the rate per day, week or month paid to workmen for their services.

These axioms are undeniable and the author shows pretty conclusively that whatever is added to the cost of any one of the three components of the cost of production must be deducted from one or both of the others—for the cost of staple articles must be the same all over the globe, so that one country can successfully compete with another. This being the case a raise in the rate of wages means a reduction in cost of material or expenses—and anything tending to reduce the cost of these components tends to raise wages. So that we see that taking off duties and reducing freights on raw material, will increase the rate of wages if "expenses" remain the same. If the employer is willing to economize in his office expenses, if rent is cheap, etc., this also increases the rate of wages, cost of material remaining the same.

From this Mr. Richards reasons that any arbitary attempted raise of wages by Trades Unions must be abortive unless the cost of material and expense can be reduced; implying we presume thereby that the wage earner should thoroughly look into whether these two components are getting more than there fair share of the total cost before going into the expensive luxury of a strike, if it be a strike for an increase of wage. Sympathetic strikes connot be measured by any such material measure.

This is a rough outline of the arguments of the book, to get completely at the author's argument it is necessary to study the whole.

The matter is presented in a clear practical manner: somewhat unscientific in expression but so that we can understand what he means.

Some of his deductions we must take exceptions to—*e. g.*:

"A fall in the values of the necessaries of life is the same thing as a rise in wages, and for the working man a much better thing, because more permanent."

According to this a Chinaman or Hindoo is much better off than an American, for the necessaries of life are much cheaper in their countries than in this. Experience teaches us that such a proposition is utterly absurd. The experience of the producer to-day proves to the contrary, every thing is cheaper in the United States to-day than they have ever been before at least in the memory of man, but

the people are a great deal worse off than they ever have been before—these are undeniable facts, so that any argument that leads to such a *reductio ad absurdum* must be wrong.

The fallacy lies as in most economic theories, we believe, in the attempt to treat the sentient human being, full of affections and passions as a machine, and coming under certain hard and fast laws applicable to matter but not to soul. The aristocracy of France believed that certain natural laws put them in the position in which they were, but their calculations were all knocked out by the French Revolution, the plutocrats of America to-day believe that certain natural laws govern their financial systems and wages system; but their calculations will be knocked out in a few years as badly as those of the French aristocrats of one hundred years ago.

To show how completely Mr. Richards fails to apply his own arguments he inserts a diatribe against "Trusts." To follow logically his argument trusts are the very best things for the wage earner. By concentration of effort they save considerably the cost of raw material and very considerably the "expense" as it is a well known axiom that a large establishment under one head costs a great deal less to run than a number of little ones—so that these two components of cost being so considerably reduced surely the amount of wage fund must be increased and so the rate of wage.

He states this system of Trusts is among many other bad things "complete Socialism, with Commerce destroyed". Commerce can look after itself, at present it is not an immitigated blessing to America—as almost all the profits of Commerce to-day go into foreign pockets—"*Complete* Socialism" is a mistake; to make it complete these trusts must be run by the people and for the people on a scientific basis; on which basis so far neither production nor distribution has been run.

The ELECTRICAL REVIEW has just completed its twenty-eighth volume, which contains some of the best newspaper work ever done by a technical journal. In addition to giving thoroughly reliable news of the progress of electrical work in all its branches, it has secured in the past six months a large number of unusually valuable and exclusive articles on important subjects. It printed the first official interview with Professor Roentgen and the only interview with Professor Salvioni, of the University of Perugia, Italy, who made some very interesting and remarkable discoveries on the Roentgen ray.

The *Review* was also the first to give an illustrated description of the new Westinghouse-Baldwin electric locomotive and obtained the first official interview with Thomas A. Edison on his new fluorescent lamp. This interview was illustrated with a sketch of the lamp made by Mr. Edison for the *Review*. The greatest honor that this journal has attained is that it was selected exclusively by Nikola Tesla for giving to the world the remarkable series of articles written by him, describing his wonderful progress in X-ray photography and in vacuum-tube lighting.

The electrical field is rapidly broadening and the class of people interested in its progress is as rapidly widening; the progress made from week to week is faithfully delineated for their benefit in the *Electrical Review* of New York City.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Contractor May Have Fraudulent Conveyance Set Aside.—A contractor having a mechanics' lien may sue to set aside as fraudulent a conveyance of the premises by the owner. His standing, said the court, is not that merely of a general creditor, who must first obtain a lien on the property of the debtor by the recovery of a judgment and issue of execution. His lien is perfect on complying with the requirement of the statute, and it is a specific lien on the particular property, similar in all respects to a mortgage.

Mahoney v. McWalters, Supreme Ct. App. Div., 38 N. Y. S. Rep. 256.

No Liens for Plans Without Superintendence.—An architect, who prepares plans for a building, and also superintends its construction, is entitled to a mechanic's lien for his entire services; but the preparation of plans alone, not supplemented with superintendence, does not give him a lien. It is the part the architect takes during the construction that draws his services within the lien law? And where only a portion of the work has been done, and the construction indefinitely suspended, the argument that the plans may be used eventually in the completion of the building does not assist the architect, for he never had a lien for his plans. If nothing had been erected, he would have had his damages, no more. He may have judgment for damages now, and the court can no further aid him.

Rinn v. Elec. Power Co., Supreme Ct. App. Div. 38 N. Y. S. Rep. 345.

Effect of Estimate By Architect.—Where the owner and a building contractor have agreed that payments shall be made as the work progresses on estimates to be made by the architect, such estimates have the force of findings between the parties, and are binding on them unless impeached for fraud.

Kilgore v. N. W. Tex. Bap. Ed. Soc., Supreme Ct. Tex , 35 S. W. Reporter, 145.

Action for the Price of Brick on Refusal to Accept.—A purchaser who, after the delivery of part of the brick called by a contract, refuses to accept or receive the balance, must pay the contract price for the brick delivered. And for damages for breach of contract by refusal to receive the balance, the seller has the right to show the market price of the brick at such time, and recover the difference between such price and the contract price.

Breneman v. Kilgore, Ct. Civ. App. Tex. 35 S. W. Reporter 202.

Purchase of Interest in Property Does not Extinguish Right of Lien.—The fact that, during the progress of their work, contractors claiming mechanics' liens purchased an undivided half interest in the property, will not extinguish their lien, where it appears that the owner had become insolvent, and unable to pay such contractors; that the deed was taken in order to secure a loan on the property, and complete the work; that the contracts were not surrendered or cancelled; and that there was no express agreement for discharge of the liens.

Blatchford v. Blanchard, Supreme Ct. Ills. 43 N. E. Reporter, 704.

When Right to Lien is Waived.—A mechanics' lien is waived or discharged where the parties enter into a special agreement inconsistent with the existence of the lien; as, for example, by the laborer or material man extending credit to the owner beyond the statutory period for bringing an action to enforce the lien.

Elenniken v. Liscoe, Supreme Ct. Minn., 66 N. W. Reporter, 979.

Rights of Purchaser of Effects of Insolvent Contractor.—Where one buys at sheriff's sale the property of a contractor who has failed, and assumes the place of the contractor, under a partially performed building contract, completes the work for him, he is entitled only to the amount which would have been due the contractor, who had been overpaid for the work already done by him.

Marshall v. Brick, Sup. Ct. Penn. 34 Alt. Rep. 520.

BUSINESS MOSAICS.

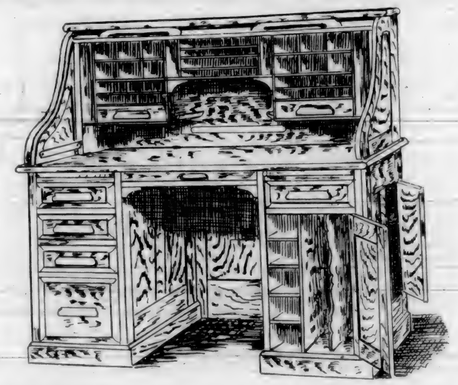
In calling attention to the advertisement of the John Douglass Co., 208 Ellis street, San Francisco, we have this to say, that you miss something worth seeing if you do not call and examine their absolutely noiseless tank and other improvements in the way of water closets.

Lawyer Quibble—What was the greatest trial you ever presided over, judge? Judge—Bringing up ten daughters, sir!—*Spare Moments.*

Architects that have the interest of their clients in view should not fail to specify the use of Dixon's Graphite Paint for roofs and all iron work—as it is unquestionably the best paint for that purpose now on the market. Don't keep in the old rut and use something else because you have been in the habit of so doing, but order the best and see that you get it.

"Is it cold out your way, Mr. Stubbub?" "Cold? Our billygoat won't eat a bite of anything but woolen underwear."—*Chicago Record.*

Oak flooring and Oak furniture are good things to have, if you get California Oak manufactured in California all the better; now this is what the San Francisco Manufacturing



Company does, therefor, that should be the place to go for your Oak furniture. Estimates for Oak flooring are furnished by Mr. Charles J. Bruschke, late of Chicago, 644–648 Bryant street, San Francisco.

He—Even the undertaker was overcome with grief. She—Was he a relative? He—No, but the deceased was the only doctor in the town.—*Ex.*

If you have not examined the merits of the Imperial Porcelain ware, manufactured by the J. L. Mott Iron Works, now is the time to do so, as Mr. M. S. James the Pacific Coast representative of the company has on hand a fine display of this ware at his show room, 27 Flood Building. Seeing is believing, therefore we recommend any in want of the best the market affords to call upon Mr. James.

"Before they build any more skyscrapers in this town," observed Uncle Al, picking his way gingerly across the muddy street, "my opinion is that they ought to pay a little more attention to scrapping the earth."—*Chicago Tribune.*

"Mrs. Beverly always does her hair up in such a beautiful twist." "Yes, but it reminds me of the rumor that her father once kept a pretzel bakery."—*Chicago Record.*

Chili Bar Slate Company furnish roofing slate, slate slabs, black boards, etc., etc. Estimates furnished on application. It should be remembered that this slate comes from quarries in El Dorado County, California, and is the only California slate on the market. At a time when the effort is being made to encourage home industry this is an important fact to consider, as the quality of the slate is all that can be asked for. J. A. Baxter, superintendent, room 24 Merchants' Exchange, San Francisco, Cal.

Aunt Susan—"He was a bad man, and I'm afraid he has gone to the hot place. Nephew George—Oh, well aunt, he won't mind it; he's used to scorching, you know.—*Ex.*

If you are in doubt what window cord to use, send for samples of Samson Spot Cord, warranted free from waste and imperfections. Address 115 Congress street, Boston, Mass.

Merchant & Co., Philadelphia, have published a charming leaflet entitled "Overhead," showing buildings in this State, as well as in other portions of the country where Merchant's Metal Spanish Tiles, made of copper, steel and tin have been used with very good effect—besides being attractive and ornamental, these tiles make a thoroughly storm-proof roof.

"Bill, there's a deal of poetry about the moon after all!" "Tom, there ain't no poetry in nothing when it gets down to its last quarter!"*Life.*

Dugan Bros., contractors for steam and hot water heating apparatus, 404–406 Mission street, San Francisco, are the Pacific Coast agents for H. B. Smith Co's. boilers, also Van Auken Steam Specialty Co's. various inventions relating to the use of steam; see their advertisement on page x of this Journal

"My," said the freckled boarder who came late to break, fast, "I wish I had my wheel kit here; I'd pump up these muffins."—*Chicago Record.*

If you are going a hunting it would be well to call upon Phil. B. Bekeart, 159 New Montgomery street, as you can get a good gun as well as a Hunter Cycle and between the two you would be sure of good sport.

CITY BUILDING NEWS.

Bartlett near 23d: Two-story frame; owner, Mrs. Lucy McPherson; architect, Martens & Coffey; contractor, Wm. Tegeler; signed, June 30; filed, July 1; cost $3940.

Bryant and Broadman Place. Frame building; owner, E. F. Smiddy; contractor, H. Munster; signed, June 29; filed, July 1; cost $6800.

Broadway and Hyde. Frame building for twenty-six flats; owner, Anna L. Whittell; architect, Clinton Day; contractors, Campbell & Pettus; signed, June 12; filed, June 12; cost $28,256.

Broadway and Hyde. Plumbing for twenty-six flats; owner, Anna L. Whittell; architect, Clinton Day; contractor, W. F. Wilson; signed, June 22; filed, June 23; cost $4613.

Broadway and Buchanan. Interior wood work; owner, Annie Donahue; architect, Clinton Day; contractors, Fink & Schindler; signed, June 10; filed, June 25; cost $3484.

Broadway and Buchanan. Plumbing, etc.; owner, Annie Donahue; architect, Clinton Day; contractors, Westphal & Volkmann; signed, June 25; filed, June 25; cost $1165.

Brannan near 4th. Carpenter work, etc.; owner, Rev. Denis Nugent; architect, R. J. Clinch; contractors, Cameron & McDonald; signed, June 26; filed, June 26; cost $6990.

Bush near Taylor. Three-story frame; owner, Mrs. Babette Federlein; architect, Martens & Coffey; contractor, R. Trost; signed, June 11; filed, June 13; cost $3600.

Castro near 19th: Three-story frame; owner, J. H. Berghauser; contractor, T. A. Bonn; signed, June 24; filed, June 30; cost $7350.

Church near 16th. Two-story frame; owners, Hampton & Baily; architect, A. C. Hampton; contractors, Dutton & Halm; signed, June 27; filed, June 27; cost $1175.

Clay near Walnut. Two-story frame except plumbing, mantels, etc.; owner, Annie L. Osborn; architects, Coxhead & Coxhead; contractor, Robert Currie; signed, June 15; filed, June 18; cost $4507.

Clay and Locust. Carpentry, brickwork, etc.; owner, Henry Fordman; architects, Salfield & Kohlberg; contractors, W. H. and T. Kinread; signed, June 23; filed, June 27; cost $6837. Excavations, etc.; contractor, C. Greise; cost $720. Painting, etc.; contractor, F. Wagner; cost $360.

Cortland and Andover. Alteration and additions; owner, Board of Educations; architect, C. I. Havens; contractor, A. H. McKay; signed, June 4; filed, June 11; cost $24,390.

Columbia near 26th. Water closets; owner, Board of Education; architect, C. I. Haven; contractor, J. H. McKay; signed, June 4 filed, June 11; cost $1140.

Devisadero near Oak. Two-story frame; owners, Mary A. Phelps, Ynez O. Phelps; architect, J. M. Curtis; contractor, Neil, Mulloy; signed, June 24; filed, June 26; cost $6500.

Dolores and 17th. Three-story frame; owner, College of Notre Dame; day's work; cost $20,000.

Eighth Ave. near C street. Cottage; owner, Mrs. Alma Bradeen; contractors, Leterell & Kartick; signed, June 30; filed, July 1; cost $1300.

Fillmore near Fell. Alterations and additions; owner, Rev. James Flood; architect, T. J. Welsh; contractor, John J. O'Brien; signed, June 15; filed, June 17; cost $1230.

Fremont near Howard. Reconstructing brick building; owner, W. F. Whittier; architect, E. R. Swain; contractor, James M. Kelley; signed, June 5; filed, June 11; cost $12,136.

Geary near Jones. Alterations, etc.; owner, William Sharp; architect, F. B. Wood; contractor, R. Currie; signed, June 6; filed, June 12; cost $1870.

Golden Gate Ave. near Polk; Alterations and additions; owner, Louisa E. Conrad; architects, Havens & Toepke; contractor, Peter J. Lynch; signed, June 12; filed, June 12; cost $1275.

Green near Baker. Two-story frame; owner, George H. Baker; architects, Mooser & Son; signed, March 25; filed, June 16; cost $2170.

Grove near Larkin. Water closets, etc.; owner, Board of Education; architect, C. I. Havens; contractor, William Linden; signed, June 1; filed, June 11; cost $4997.

Haight near Fillmore. Alterations and additions; owner, George Wendel; architects, Laist & Schwerdt; contractor, D. Currie; signed, June 22; filed, June 25; cost $5275.

Haight street, No. 1166. Alterations and additions; owner, A. Lopresti; architect, W. J. Cuthbertson; contractors, Perry & Green; signed, June 10; cost $800.

Howard near 17th. Two-story frame; owner, Peter Windeler; architects, Martins & Coffey; contractor, Carl Schutt; signed, June 22; filed, June 22; cost $5300.

Hyde near Turk. Three-story frame; owner, Jabob Silverstein; architect, A. J. Barnett; contractor, William Plant; signed, June 18; filed, June 20; cost $3300.

Jackson near Leavenworth. Two-story frame; owner, G. A. McCaw; contractors, Marcuse & Remmel; signed, June 11; filed, June 28; cost $4400.

Leavenworth near Geary. Alterations and additions; owner, A. Wisel; architects, Salfield & Kohlberg; contractor, J. J. O'Brien; signed, June 10; filed, June 20; cost $4780.

Market near 3d. Steel and iron work; owner, Claus Spreckels; architects, Reid Bros.; contractor, Pacific Rolling Mill Co.; signed, June 1; filed, June 13; cost $4681.

Market near Stewart. Brick work, etc., for six-story brick; owner, Harriet McCarthy; architects, Shea & Shea; contractor, W. J. Field; signed, June 6; filed, June 6; cost $14,772.

Market near Stewart. Carpentry work, etc.; owner, Harriet McCarthy; architects, Shea & Shea; contractors, Leahy Bros.; signed, June 4; filed, June 19; cost $42,000. Terra Cotta work; contractors, Gladding, McBean Co.; signed, June 4; filed, June 19; cost $2228.

Mission and West Ave. Two-story frame; owner, J. J. Silk; architects, Mooser & Son; contractors, Westerlund & Sandeen; signed, June 15; filed, June 15; cost $3100.

New City Hall. Plumbing and gas-fitting; owner, City of San Francisco; architect, F. T. Shea; contractor, J. J. McGowan; cost $1885.

Pennsylvania near Yolo. Cottage; owner, Fred. X. Walker; contractor, Chas. Koenig; signed, June 26; filed, June 26; cost $1085.

Post near Powell. Carpentry, roofing, etc.; owner, S. F. Gas Light Co.; architect, Clinton Day; contractor, S. F. Kent; signed, June 1; filed, June 11; cost $10,229.

Post near Powell. Granite work; owner, S. F. Gas Light Co.; architect, Clinton Day; contractor, Raymond Granite Co.; signed, June 1; filed, June 12; cost $11,120.

Post near Powell. Excavations, brickwork, etc.; owner, S. F. Gas Light Co. architect, Clinton Day; contractors, Richardson & Gale; signed, June 1; filed, June 11; cost $22,582.

Post street No. 103-109. Elevator work; owners, Kohlberg, Strauss & Frohman, architect, Salfield & Kohlberg; contractor, W. L. Holman; signed, June 12; filed, June 17; cost $1750.

Post near Taylor. Additions and alterations; owner, Marion Levertritt; architects, Wright & Saunders; contractor, W. J. Field; signed, June 5; filed June 19; cost $2075.

Powell near O'Farrell. Excavation, etc.; owner, George D. Loy; architects, Herman & Swain; signed, June 25; filed, June 25; cost $2-00;

Seventeenth and Caroline; Two-story frame; owner, George Sutter; architect, H. Hess; day's work; cost $2700.

Scott near Green. Two-story frame; owner, Mrs. Chas. B. Stone; architect, E. A. Mathews; contractor, A. S. Ruch; signed, June 10; filed, June 10; cost $5500.

Stockton near Vallejo. Two-story frame; owners, Hirsh Bros.; architects, Salfield & Kohlberg; contractor, Robert Currie signed, June 13; filed, June 15; cost $6400.

Stockton near Vallejo. Plumbing, etc.; owner, Hirsch Bros.; architects, Salfield & Kohlberg; contractor, Henry Hufschmidt; signed, June 13; filed, June 15; cost $675.

Stockton near Filbert. Alterations; owner, John Nollhenins; contractor, H. Grieb; signed, June 20; filed, June 24; cost $1450.

Stockton near Jackson. Carpentry work etc., for two-story brick; owner, M. Schuppert; architect, A. C. Lutgens; contractor, F. V. Steinman; signed, June 30; filed, July 1; cost $1640. Brick, iron and stone work; contractors, Fennell & Son; signed, June 30; filed, July 1; cost $3685.

Sutter near Jones. Brick for alterations; owner, Henry Kohler; architect, H. Geilfuss; contractor, F. Wagner; signed, June 26; filed, July 1; cost $1797. Plumbing; contractor, H. Williamson; cost $4910. Painting; contractor, Schafer & Slade; cost $1020. Raising and moving, etc.; contractor, Silas Carle; cost $10,699.

Sutter and Hyde. Tin and copper work for six-story brick; owner, Dr. J. Rosenstirn; architects, Salfield & Kohlberg; contractor, Jos. F. Forderer; signed, June 10; filed, June 16; cost $2660.

Sutter and Hyde. Cast and wrought iron work; owner, Dr. J. Rosenstirn; architects, Salfield & Kohlberg; contractor, Otto Schrader; signed, June 8; filed, June 16; cost $3281.

Taylor and Clay. Three-story frame; owner, John Rohde; architects, Martins & Coffey; contractors, Lorenzen & Fevrier; signed, June 23; filed, June 24; cost $4964.

Third Ave. near Point Lobos. Two-story frame; owner, F. Nusbaum; contractor, A. Dahlberg; signed, July 1; filed, July 1; cost $2600.

Twelfth near Isis. Alterations and additions; owner, Kate Mars; architect, W. H. Wharff; contractor, F. A. Blanchard; signed, June 9; filed, June 9; cost $1745.

Twenty-sixth and Point Lobos. To build; owner, J. J. Kenny; architect, Winfield Kenny; contractor, M. J. Scott; cost $3000.

Van Ness Ave. and Clay. Marble and bronze work; owner, Claus Spreckels; architect, Reid Bros.; contractor, Patterson & Eisele; signed, May 29; filed, June 13; cost $75,025.

Van Ness Ave. and Clay. Electric and gas fixtures; owner, Claus Spreckels; architects, Reid Bros.; contractors, Thomas Day & Co.; signed, June 15; filed, June 27; cost $7757.

Van Ness Ave. and Clay. Bronze andirons, etc.; owner, Claus Spreckels; architects, Reid Bros.; contractor, F. Happersberg; signed, June 16; filed, June 27; cost $9092.

Van Ness Ave. and Fulton. Mill work, etc., for three-story frame; owner, I. Selig; architect, M. J. Lyons; contractor, W. H. and T. Kinread; signed, June 26; filed, June 29; cost $15,750. Plumbing; contractor, R. Rice; cost $2660. Painting; contractor, D. Zeliuksy; cost $1200.

The California Architect and Building News.

Copyrighted 1895, by the California Architectural Publishing Company,

OFFICE, 408 CALIFORNIA STREET, SAN FRANCISCO, CAL., U. S. A

VOLUME XVII. AUGUST 20th, 1896. NUMBER 8.

A MONTHLY JOURNAL DEVOTED TO THE ARCHITECTURAL INTERESTS OF THE PACIFIC COAST.

Published on or about the 20th of each month by The California Architectural Publishing Company. The Stockholders being Architects and others interested in the profession.

SUBSCRIPTION TO THE JOURNAL, - $3.00 PER YEAR IN ADVANCE.

ESTABLISHED 1879. - - - INCORPORATED 1889.
NOW IN THE SEVENTEENTH YEAR.

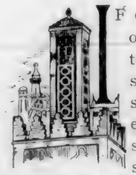
PREMISES OF NEW SAN FRANCISCO POST-OFFICE, AUTHORIZED BY ACT OF CONGRESS, MARCH, 1887.

EXISTING POST-OFFICE BUILDING AT SAN FRANCISCO, CALIFORNIA.

A MULTI-MILLIONAIRE is putting a twenty-thousand-dollar sidewalk in front of his residence. How does that compare with the nation's sidewalk in front of its post-office site illustrated above.



IF our readers will compare the above view of the existing condition of the property of the Federal Government with the view shown in our last month's issue, he will see that the government is enlarging and extending its advertising plant. A second story has been added to the wooden fence surrounding the site for San Francisco's new post-office building, and in addition to its previous

announcements of physic and flour, beer and tobacco, it it now engaged in booming a new brand of baking powder.

As the prosperity of the country is becoming beautifully less year by year, and the poverty and degradation of the laboring classes is augmenting in a corresponding degree, it is possible that the government is seeking to off-set the resulting idleness and discontent, by itself embarking in the advertising business, with a hope that it may possibly stimulate business.

We would like to call attention to the fact that private individuals are prohibited by our municipal ordinances from erecting or maintaining any advertisement frame or fence which is more than ten feet above the ground. Of course the Federal Government is superior to any restrictions imposed by local legislation, and has the power to deface the appearance of our streets at will; nevertheless it would ses a very desirable example of respect for law, by conforming to reasonable regulations, instead of haughtily ignoring them and allowing them to be contemptuously violated.

While on the subject of our new post-office site, we would like to notice the fact that according to the columns of the daily press, there is now sojourning amongst us, an agent of the Treasury Department, who has extended an invitation to all dealers in building materials to furnish samples of their wares, to aid the Supervising Architect of the Department in selecting suitable materials of which to construct the new post-office, which the authorities have for some years past been asserting is their intention to erect.

It seems to us rather puerile to ask for samples of bricks and samples of lime and cement. Surely the department is capable of deciding upon a standard of quality in the matters, and of specifying that any materials not of the quality demanded shall be rejected, thus leaving the field open to all manufacturers who can furnish goods of the required standard. If it takes the course of chosing a particular make of bricks and a particular brand of cement, it will certainly be an arbitary method that will not give the best results, and if it does not propose to act in this arbitary manner, it is simply putting dealers to useless inconvenience in submitting samples.

If we were called on for an opinion as to why this request was made, we should quote from one of Victor Hugo's novels: he says in *Notre Dame de Paris*, that when an audience is becoming clamorous for the play to begin, and the management is not ready to begin the play, the only sure way of pacifying the audience, is to announce that "the play is to begin at once;" this invariably quiets the audience, and gives the management time to prepare. This is possibly a parallel case; the commencement of work on the post-office has time and time again been publicly announced; as the date is long since passed, and there is still no probability of work being begun, some sop must be thrown to the public, and an agent is sent here to announce that "the play is about to begin."

UGLY BUILDING.

SOME day we shall reach the point of enlightenment that was attained by a certain pagan race on the Aegean some twenty-four centuries ago, and shall speak out boldly thus: "He that builds an ugly building robs me of so much blue sky. He shall restore my sky or go to prison."—*Baptist Standard.*

A CURIOUS discussion has lately taken place in one of our daily papers, as to the truth of certain statements made in the *Arena* by Jno. E. Bennett in an article entitled "Is the West Discontented? Is a Revolution at Hand?" in which he states that "The West IS discontented. It is a simmering, seething cauldron of discontent" and gives Los Angeles, where he is living, as an example.

He gives the state of mind of his neighbors in the same street as he is living and he finds them all discontented from his standpoint.

In regards to discontentment in the building trades and architectural profession, he has this to say:

"There is a great deal of building going on at present in the city; let us inquire among the architects. None of them are busy, yet almost every man has one or more jobs in his office, through which he manages to keep the establishment afloat. We remark to him that there is plenty of building going on in town just now, and he replies: 'That's so, but the architects get little of it.' Ask him why and he tells you that the contractors do most of it, furnishing their own plans, enabling the owners to avoid the services of an architect. The business, too, is cut up, he tells us. It is impossible any longer to get a living remuneration for the services of an architect. The fees of five per cent on the cost of the building, fixed by the Architects' Association, are lived up to solely by the members of that association, and if suspicion is correct many of these default in the observance of this rule. Outside of the association no one pretends he will let a job go because he will not take less than five per cent. "You can get an architect to design you a $10,000 building for $50. You will have to look sharp, though, that he does not make it up on you through collusion with the contractor, for he will do it if he can.'

"If the contractors are doing the bulk of the work, we reason that these, at least, must be well employed, and with excellent returns. Yet when we move among them, what do we find? The number so great, and the competition so intense, that a $1,500 building will be figured on by twenty-two contractors! Ask them if they are discontented, and if so, why? They will say there are too many men in the business; too many contractors for the work; that half of them ought to be doing something else; that a contractor can't get a job unless he finds an owner who wants to build or he can become the favorite of an architect.

"But the building trades are not alone in their discontent; it is in all trades, in all professions. A few are doing well; the many are struggling, barely keeping down expenses."

In San Francisco prices have not quite got so low as in Los Angeles and yet we will find at least the great majority of men in the building trades discontented and thoroughly disgusted, even those who are quite busy, don't seem to be happy over it. Ask them and they will tell you "Yes I'm busy, but things are cut down so there's nothing in it." If discontent then is so rife in San Francisco, where prices are higher than in Los Angeles it would be reasonable to suppose that discontent is still greater in Los Angeles, and we shall have to admit the truth of Mr. Bennett's statements.

However, the San Francisco *Examiner*, which has taken up the cudgels against *The Arena*, states "There is no difference of opinion amongst the well informed as to the condition of Los Angeles, all are agreed that the city is flourishing and its people well to do and reasonably happy."

This statement altogether depends upon what one considers as *reasonably* happy. A man is happy or he is not happy—happiness has nothing whatever to do with reason, being one of the passions, so "reasonably happy" is an incomprehensible term.

In confirmation of the above statement it publishes telegrams from "representative" men.

The representative men are the Mayor of Los Angeles—who would, holding the position he does, not dare to admit that the city he represents in such an honorable position is a discontented city, and he should have been excused.

Next come W. C. Patterson, President Los Angeles Chamber of Commerce. It would hardly do for the President of the Chamber of Commerce to admit that Los Angeles is a discontented city officially. "Nothing succeeds like success" and it is necessary for the sake of commerce to keep up the standard of Los Angeles as a contented prosperous city.

Next comes J. S. Bancroft, Ex-President Los Angeles Typographical Union and delegate in Council of Labor—in a paragraph picked out by the *Examiner*, he says: "The reports from the various labor organizations represented in the Los Angeles County Council of Labor are, *in the main*, to the effect that at least a *fair* state of trade exists." The italics are ours.

We cannot call this a very enthusiastic report or a very roseate view of affairs; "a fair state of trade" doesn't appeal to the imagination as denoting anything rushing or indicative of a mass of contentment, especially when the *fair* state of trade is reported only "in the main," there are evidently some reporters that report trade as bad—if these report trade as good surely Mr. Bancroft would have mentioned them.

There are other protests against *The Arena's* article coming from newspaper men, these depend on the advertising community chiefly, and it would not do to antagonize that class; so they are excused, being interested parties.

Then there are hotels and theatre proprietors and railroad men, these all depend on travel and it would not do to have Los Angeles advertised as filled with a large discontented class. The rich tourist upon whom they depend, doesn't wish to come among such a class, he wishes to have pleasurable surroundings.

Eliminating all these parties we have G. J. Griffith a ranch owner, whose picked paragraph says: "Probably this is the most prosperous city in the country to-day, and the healthful growth of the place is assured beyond question." Mr. Griffith carefully ignores the fact of their being a large body of discontented people in Los Angeles, but branches out into these generalizations, which are issued almost every day in every city by enterprising real estate agents. He calls Mr. Bennett's statement "a piece of flagrant misrepresentation" but gives not an iota of evidence proving it is so.

C. W. Pendleton—who does not give his business and therefore is presumed to be a gentlemen of leisure—makes this statement picked out by the *Examiner* as specially pertinent being printed upside down: "The article is out of all reason, and shows a disregard for the truth which relegates old Ananias to the shades of has-beens. It is a needless misrepresentation, and one which can have but the single result of rebounding to the discredit of the author."

Which is simply a tirade against the author and proves nothing. He says also that "Los Angeles is good enough for anybody," this, Bennett nor nobody else disputes, it's the conditions which make discontented people therein which are not good enough for anybody.

The last is from Frank P. Flint, Attorney-at-law, who says: "This place stands to-day one of the most influential cities of the West, and one whose prosperity has heretofore been pointed to as an object for envy." This also goes to prove nothing, except the melancholy fact that such an influential city and one whose prosperity is an object of envy, should be filled with such discontent as that proven by Mr. Bennett, and raises the saddening thought of what a terrible amount of misery and discontent must be in those cities which are not objects of envy. He calls Mr. Bennett's articles a "palpable exhibition of misdirected effort." It might be even so, and yet the facts he exhibits be true.

HOUSING OF PEOPLE OF SMALL INCOMES.

No. 1.

IT is the object of these papers to present to our readers all that has been done in the way of housing the class which form the majority of our citizens—those of small incomes.

So far in the Pacific Coast States we have not got into the over-crowded state which prevails in the East and in the old countries. It is well, however, to be prepared for it—for the incomes of the majority of our people have become so low within the last two or three years that those who formally occupied seven rooms have come down to three, those who occupied three, to one.

We shall take as the basis of our remarks the Special Report of the Commissioner of Labor on the Housing of the Working People, and shall cull from its pages liberally, and shall follow its arrangement generally. The book is divided into twelve chapters:

"Chapter I, is on the scope and character of the present inquiry. Chapter II, while disclosing general sanitary organization in England, France, Belgium and Germany, gives special attention to the local regulations of metropolitan centers within these countries and the United States. A comparative method of social study is the only really valuable one, and the disclosure of what is being done in one center is a positive advantage to all the others. Local conditions, of course, may vary, but the efficiency of general lines of policy is the point to guage. Chapter III deals with expropriations for purposes of public health in their legal aspect and financial and sanitary results. The facts cited are useful both for precept and for warning. Chapter IV treats of certain results of sanitary reform in a few metropolitan centers at home and abroad. Chapter V deals with sanitary aid societies and their work. Chapter VI sets forth the building regulations of representative cities in different countries with the aim of showing what provision is made for guarding against the perpetuation of structurally defective habitations. Chapter VII treats of public intervention in the housing of working people, giving the most notable laws which have been passed and furnishing data showing the encouragement accorded by municipalities,

savings banks, etc. Chapter VIII presents information in relation to rent collecting and other agencies for improving the living environment of working people. Chapters IX, X and XI deal with model housing, and treat respectively of block buildings, small houses, and lodging houses. These three chapters constitute the major part of the present volume. The prominence given them is justified, because it is important to know whether model effort has accomplished or can accomplish useful work. Hence a history of the operation and financial results attending the activities of model enterprises has received conspicuous attention. There exists an undoubted sphere of effort for them in all communities, and for this reason great pains have been taken to present all the facts (even to technical details), with plans of various types of buildings, so that any community, corporation, or individual contemplating action may find in these pages a choice of that particular form of enterprise which will best suit local conditions. It is not pretended that a complete census of model enterprises has been made, but it is believed that almost all of importance in Great Britain, France, Belgium, Germany, the Scandinavian countries, and the United States have received mention. It may be a revelation to some to know that so many exist. The general lesson gleaned from a study of the facts in these three chapters is encouraging. It shows that proper housing of the great masses of working people can be furnished on a satisfactory commercial basis. * *

"Chapter XII is entitled 'Economic and ethical aspects.' The caption may suggest more than perusal of the text will justify. Academic discussions have no part in a statistical investigation such as this; hence only the economic and ethical features of the facts revealed by the inquiry have received treatment. Chapter XIII summarizes briefly some of the more important conclusions.

"The aim of this report is to communicate information which will be serviceable to all persons who are in any way concerned with house sanitation, to architects, builders, philanthropists, or public spirited citizens, and especially to all who may desire to promote the growth of model housing enterprises. The best methods of rendering dwellings habitable, of eradicating slums, of guaranteeing the sanitary character of new buildings, of multiplying model dwellings, and of developing popular proprietorship of homes are presented, not in theory, but as they exist in fact."

The second chapter is on Sanitary Laws and commences in this wise:

"Wisely conceived and well enforced sanitary laws are a supreme necessity of modern civilization. The let-alone policy, if admitted, would mean that urban populations would periodically suffer from fearful epidemics, and that a vast number would fall into pauperism and moral degradation under the irresistible impulsion of unhealthy environments. Legislatures have thus seen the necessity of endowing metropolitan centers with large powers for their self-protection. In New York these powers are especially drastic. Recently a better code has been established in London, but most of the continental countries have not yet fully risen to the occasion."

Which goes to show that the policy of *laissez faire* or individualism is impracticable in the social stage in which we now are and admits the necessity of state interference in cases where people are not able to help themselves, not only for their own protection but for the protection of their neighbors. The idea that a man may do what he likes with his own or with his private property, is shown to be now antiquated, and laws circumscribing his powers in that direction are admitted to be a public benefit—that is the idea of sociality—that society must be protected against any individual who imagines that he may do what he likes with his own even though it causes evil to his neighbor. This is now admitted in sanitary matters, matters pertaining to the health of the body, and it must be admitted in regard to other matters before we obtain a decent sociality.

All cities have now their departments of health, which have powers to protect society against the careless or criminal individual.

"The head of the New York health department is the board of health, which consists of the president of the board of police, the health officer of the port, and two officers to be called commissioners of health, one of whom must have been a practicing physician for at least five years preceding his appointment. The other commissioner, who is not a physician, shall be the president of the board. Both commissioners hold office for six years.

"The department of health is divided into two bureaus. The chief officer of one bureau is called the sanitary superintendent, who at the time of his appointment must have been for ten years a medical practitioner and for three years a resident of the city. The chief officer of the second bureau is called the register of records, and this bureau deals with vital and other statistics. The sanitary superintendent enforces the provisions of the sanitary code and the laws and the ordinances relating to tenements and lodging houses, etc.

"The board of health has executive, judicial, and legislative powers. It establishes its own sanitary code, which is supplementary to the laws and ordinances relating to the subject. It can order the inspection of any premises at any time, and is empowered to call upon the police authorities to enforce sanitary laws and regulations. Refusal to obey orders or to conform to regulations is considered a misdemeanor, and the responsible parties, in addition to being subject to punishment therefor, incur a penalty of $250, to be sued for and recovered by the board in any civil tribunal in the city. Wherever a minimum penalty for refusal to obey or for a violation of an order, regulation, or ordinance is not fixed, the amount recovered shall not be less than $20, the exact sum to be fixed by the judge presiding at the trial.

"The board can order a house vacated when unfit for human habitation by a vote of three out of the four members. In all such cases in the past there has not really been a dissenting voice. An order to vacate must be posted conspicuously in the interdicted building or part thereof, and must be personally served on the owner, lessee, agent, occupant, or any person having charge. If such person can not be found, service of the order may be made through the mail. Orders to vacate are by no means infrequently made. Seventy-five of them were issued between the latter part of May and the middle of July, 1893. The sanitary superintendent has a force of forty inspectors continuously at his service. Twenty of them are physicians and the remainder are technicians in the department of service to which they are assigned.

"The members of the board of health, the sanitary superintendent, or any of his subordinates, may enter upon, examine, and survey all grounds, building, apartments, etc., and inspect their safety and sanitary conditions, making plans, drawings, and descriptions. The board may publish a report of the sanitary condition and results of such inspections in so far as it considers the publication to be useful.

"Until June, 1891, the control of light and ventilation, plumbing and drainage of all new buildings belonged to the sanitary department of the board of health. At that date, however, the division was transferred to a new department of buildings. The powers of the board, however, still extend to the repairs of buildings, houses, and other structures, and the sanitation of new buildings, sewerage, drainage, plumbing, lighting and ventilation of all structures after they have once been completed.

"The law requires that all work must be done by registered plumbers; that all persons pursuing this craft must register under such rules and regulations as the board of health may prescribe. It is unlawful for any other than a registered plumber to carry on the plumbing business in the city.

"It is made the duty of the police department to promptly notify the board of health of any threatened danger to human life and regularly to report all violations of health laws and ordinances, and to give any useful sanitary information. The execution of orders is committed to the police department, and at such times police officers have as ample power and authority as when obeying any prescription of the board of police or when acting under the warrant of a judge. They are responsible for their conduct, however, to the board of police, and not to the board of health.

"For the purpose of carrying out the provisions of the law in relation to tenement and lodging houses, as well as to enforce the provisions of the sanitary code, forty-five policemen, who are men of experience and who have at least five years' service, are detailed for work under the board of health. Fifteen of these are occupied exclusively in the enforcement of laws relating to tenement and lodging houses. These officers are known as the sanitary company of police, and report to the president of the board of health. The latter body pays their salaries and reports any cases for discipline back to the police department. Should objections be made on the ground of inefficiency, another detail must be made. These officers take pride, as a usual thing, in their work. They are entitled to retire after twenty years' service, but, as a matter of fact, they rarely do so. While on inspection duty each sanitary policeman carries a memorandum book in which he notes any cause for complaint. The following is a list of subjects upon which he has to report:

Location—Number of families; number of occupants; privy accommodations—number of sittings; housekeeper on premises; owner on premises.

Cellars, if occupied for dwelling purposes—Whether floor is water-tight; whether the ceiling is plastered.

Yards—Whether properly graded; whether sewer connected.

Front areas—Whether graded; whether sewer connected; sanitary condition.

Waste pipes—Whether joints are connected with cement or lead; whether trapped; whether ventilated two feet above the roof.

Soil pipes—Whether joints are connected with cement or lead; whether trapped.

General inspection—Cellars; stairs and balusters throughout the house; walls and ceilings of halls and rooms throughout the house; floors of rooms and halls throughout the house; slop sinks, whether trapped or ventilated; wash basins, whether trapped and trap ventilated; bath tubs; whether trapped and trap ventilated; Croton supply pipes, roof; wash roof; skylights; leaders; eaves gutters; chimneys; fire-escapes; water-closets, whether trapped and trap ventilated; privy vaults; school sinks; privy houses; cesspools; urinals, whether properly flushed; clothes poles; fences; hydrants in yards; airshafts.

Ash receptacles—Whether sufficient; in sanitary condition; whether kept within stoop line.

"The sanitary policeman rectifies minor nuisances, but those which can not be dealth with, either because of the unwillingness of the responsible party to make the necessary ameliorations, or because of lack of technical knowledge, are reported to the board for action. If the case is a simple one, an order is immediately made, but where technical matters are involved, one of the regular sanitary inspectors is detailed for inquiry and report before final disposition is made. One of the most important duties of the sanitary police is to make night inspections of tenements and lodging houses, to see that overcrowding does not occur. The inspection of tenement houses, obligatory at least twice each year, is made by the sanitary police force.

"Citizens' complaints relating to tenement houses are referred to either a sanitary police officer or a sanitary inspector, according to the nature of the complaint. If, upon examination, the nuisance is found to require an expert examination, reference is made to the sanitary inspector for further examination and report, with recommendations. Where urgency exists, twenty-four or forty-eight hours' time is allowed for compliance with the terms of the order. Where there is no special need for haste, five days is the ordinary limit allowed. In the former case the sanitary police officer is sent at once to the responsible person to give information of the terms of the order and the time set for its execution. At the end of the allotted period he visits the premises, and if the nuisance remains unabated or the work has not been commenced his report of the facts to the board involves the issuance of a new order of arrest for non-compliance.

"Technical sanitary inspectors are required to have a thorough knowledge of their districts and to make a general inspection of them from time to time and to make special reports upon localities which may become dangerous to life and health. To them are referred citizens' complaints where technical knowledge is necessary.

MARK HOPKINS INSTITUTE OF ART, CALIFORNIA SCHOOL OF DESIGN.

THE San Francisco Art Association, with a view of encouraging and fostering Art, will inaugurate evening classes of Drawing from the Antique and Life, at the opening of the August term of the school year, under the direction of Mr. John A. Stanton.

These classes will be established for the benefit of all those following artistic pursuits, and who are unable to take the regular day course. Teachers in the public schools can avail themselves of the opportunity of obtaining a knowledge of the most approved methods in Art Instruction. Architects, Lithographers, Engravers and all those who

follow the applied arts, will also welcome the establishing of these classes.

The successful operation for twenty-five years of the California School of Design, the gradual improvements in its methods and the growth of its usefulness, make the management confident of the success of this innovation.

The terms will be moderate, and every effort will be made to make the classes popular. The pupils of the evening classes may avail themselves of all the privileges to which students of the school are entitled, and will be permitted to enter all competitions.

SCHOOL SESSIONS:—The first term will open first of August, and close the fifteenth of December. The second term will open on the second of January, and close on the fifteenth of May.

CLASSES CONVENE:—Monday, Wednesday and Friday evening from 7:30 P. M. to 9:30 P. M. Entrance, California and Mason streets.

TERMS:—Antique Classes, $3 per month, or $10 per term. Life Class, $5 per month, or $16 per term. Entrance Fee, $1.00, to be applied to Contingent Furniture Fund.

By Order of the Committee of the School of Design.

W. G. STAFFORD,
Chairman.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.
SETH BABSON, Pres. W. P. MOORE, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.
OCTAVIUS MORGAN, PRES. A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec'y. AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
GEO. W. DICKIE, Pres. W. G. CURTIS, Vice-Pres.
OTTO VON GELDERN, Sec. EDWARD T. SCHILD, Treas.

MASTER PLUMBERS' ASSOCIATION, meets every first and third Friday of each month at the Flood Building.
JAS. E. BRITT, Pres. J. L. E. Firman, Sec.

BUILDERS' EXCHANGE, Directors meet first Friday in each month at Mission and New Montgomery.
OSCAR LEWIS, Pres. JAS. A. WILSON, Sec.

MASONS' AND BUILDERS' ASSOCIATION, meet first Friday evening of each month.
ADAM BECK, Pres. M. V. BRADY, Sec.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

PERSPECTIVE View, Competitive Design, Proposed Municipal Building, cor. Washington and Kearny streets, San Francisco, W. O. Banks, Architect. Awarded first prize, $750.

COMPETITIVE Plans for Criminal Court Building at San Francisco, submitted by Wm. Mooser associated with Wm. Mooser, Jr., awarded second prize, $500.

COMPETITIVE design for proposed Criminal Court Building, submitted by Havens & Toepke, Architects. Received third prize, $250.

VAULT at Home of Peace Cemetery, Edw. Kollofrath, Architect.

IN our next issue the accepted plans for the Criminal Court Building, by Shea & Shea, will appear.

REDESIGNING OBJECTIONABLE BUILDINGS.

AMONG many plans for making architecture once more an art appreciated by the people, the T Square Club of Philadelphia has hit upon one which will do much to accomplish this object in a small way if it is carried out as proposed. A medal has been offered to be competed for by members of the T Square Club for the "redesigning" of some of the most objectionable buildings in Philadelphia—a most prolific field of work by the way. A photograph of the building with the approximate requirements for which it was intended will be furnished the competitors, and the medal awarded for the best solution of the problem. The publication of these designs, as proposed, will furnish an object lesson more readily comprehended than simple criticism. The plan has the great advantage of offering a remedy besides pointing out the faults of a design. There

PERSPECTIVE

is no grievance more commonly met with among artists than the complaint against the "critics." "Destructive criticism," and especially by writers who are not producers, counts for little among artists. The plan of the T Square Club is not exactly what is usually termed "constructive criticism," but it has the merit of presenting the ideas of men who from training and experience as producers are capable of looking at the work in hand from the artists' point of view. Comparison of good and bad, with a competent explanation of the reasons for the excellence of the one and the failure of the other, will frequently awaken the dormant taste of persons who would otherwise take no interest in such matters; or if interested, lack the habit of mind to make comparisons for themselves. It is suggested by members of the T Square Club that one advantage offered by this plan is the enlightenment of that class in the community who are dissatisfied with bad architecture but do not know why it is bad or how to remedy it, and in consequence passively acquiesce, and are imposed upon. This is a chivalrous motive and deserves commendation.—*The Brochure Series.*

ABOUT PAVING MATERIAL.

ALTHOUGH asphalt has come into pretty general use for street paving, there are some serious objections to it, and it is evident that we have yet to discover something which will be better adapted for street paving that anything now in use. Asphalt is expensive, and in damp weather, or a moist climate, is so slippery as to be unsafe. As a test on the latter point a record was kept by the city engineer of London, England, of the accidents arising from the condition of the streets, for fifty days, with the following result: Asphalt 1066; granite 719, wood 542. These figures indicate a serious objection to asphalt in such a climate as that of England.

The city of Halifax, Nova Scotia, has been making some experiments in paving materials for sidewalks, and the city engineer, in his report, recommends concrete on level streets, and asphalt for hills and less important streets. The cost of the former averaged $1.83 per square yard, while the latter cost only 70 cents, and under ordinary conditions could be put down for considerably less. The kind of asphalt pavement used is not specified, but from the low cost we infer that it is not such as would be suitable for roadways. This, however, by the way.

Wood block pavements have much to recommend them, but a great deal depends on the variety of wood and the way they are laid. Cedar blocks, so extensively introduced in Toronto and other cities in America some years ago, have not been a success. They will not stand heavy traffic and have been pronounced unsanitary. Hardwood is now being tried, and the Timber Trades Journal declares that in the near future the whole of London will be surfaced with wood. The variety now being used is the Australian jarrah, which has been tested in the metropolis, on some of the Paris boulevards, and in some of the provincial towns, in every case with satisfactory results. It has supplanted everything except Baltic fir, and is gradually but surely displacing that. If blocks four inches deep will answer, and they are now being tried, it will bring the cost down almost to that of Baltic fir, which has to be laid six inches thick.

Jarrah is the hardest and most durable of all Australian woods, and it is stated it will resist the wear and tear of London street traffic as long as granite. It is free from knots and does not shrink to any appreciable degree, the grain is close and tenacious, and it resists the influence of damp and moisture, in fact, being of the eucalyptus family it is a valuable antiseptic, rendering it valuable from a sanitary point of view. It affords a good foothold for horses without being slippery. What more need be said in its favor?

Other Australian hardwoods are being tried in Great Britain, one known as karri being apparently second only to jarrah, and Tasmanian blue-gum is to be tested in Glasgow. It is, of course, too much to expect that any of these foreign woods will come into use in Canada, where we have so much wood of our own. Vitrified brick, if it can be brought down to a reasonable price, will probably be the pavement of the future in Canadian and American cities.

One of the most unlikely paving materials which has been introduced anywhere is described in the Manufacturers' Record. At Norfolk, Virginia, a plant has been set in operation for making paving blocks out of the grass which grows on salt water marshes- The grass is subjected to heavy pressure, which forms it into large blocks, which are cut by circular saws into smaller blocks, 5½ inches thick, provided with strong wires, which run lengthwise. These blocks are then subjected to a bath in three tanks of different kinds of oil, which renders the fibre supple. A pave of this material has been tested for over a year in Philadelphia, on one of the busiest streets near the stockyards, and with satisfactory results. It is smooth, noiseless, and horses cannot slip on it. Large contracts for these blocks are said to have been secured from New York and Pittsburg. We must, however, class ourselves as doubters as to the wearing qualities of such a material, without further information.

But our readers will perhaps smile with incredulity when we mention another material for paving, which, if such a reputable journal as the Literary Digest is to be believed, has been successfully tested. In the southern states, where sugar manufacturing is carried on, there are millions of gallons of molasses produced, which, after supplying the market, remain over and become a waste product. The head chemist of a refinery at Chino, California, Mr. E. Turke, was led to make an experiment with the molasses, and had a walk one thousand feet long made between the factory and the main street, mixing sand with the molasses and putting it down in the same manner as asphalt. It dried quickly, became hard and remained so, the sun making it harder instead of softening it. A block of the composition two feet long and one foot wide was subjected to severe tests, being laid with its ends resting only an inch or two at each end on supports. When struck in the middle with a heavy hammer it showed no sign of cracking or bending. Notwithstanding this test, we can hardly imagine molasses coming into general use as a paving material.

It is clear from what we have stated that we have not yet passed the experimental stage in the matter of pavements.—*The Canadian Architect and Builder.*

OUR LONDON LETTER.

THE usual weekly meeting of the London County council was held on Tuesday at Spring-gardens, Sir Arthur Arnold in the chair.

The first reports to be debated were those dealing with proposals for the acquisition of tramways. The Highways

committee recently had before them two proposals—one emanating from the County of London Tramways syndicate, who proposed to acquire all the metropolitan lines, with a view to their being leased, for a term of twenty-eight years, to a company yet to be formed; the other proposing that the entire systems of the North Metropolitan and the London Street Tramways companies should be acquired by the council and leased for fourteen years to the former company. The terms of the contemplated lease were that the company should pay a fixed rental of 45,000*l* per annum. The committee recommended that the proposal of the syndicate should not be accepted; and the council endorsed this recommendation. On the other hand, the committee recommended that an arrangement in accordance with the proposals of the North Metropolitan company should be entered into. Mr. J. A. Baker moved; "That the report be referred back to the Highways committee, with instructions to report for the purpose of comparison as to the probable profit to the ratepayers, if the council itself worked such portions of the northern system of tramways as will be within its control after 1898, information being given on the basis of horse traction and also electric traction, or other approved mechanical means." This was carried by 61 to 55.

The Strand Improvement scheme came up again for discussion. The adjourned report of the committee stated that they brought up to the council in March last a scheme for the formation of a new street from Holborn to the Strand and the widening of the Strand at Holywell-street, but withdrew the scheme in order that they might once more give the fullest consideration to the whole subject. The chief features of the scheme are:—(1) The removal of the block of buildings south of Holywell street; (2) the provision of greater road space at one of the most crowded parts of the Strand; (3) the opening to view of several architectural features at present obscured, and the admission of light and air where most needed; and (4) the formation of a much required adequate Strand approach to the Royal Courts of Justice."

The interesting tour of the American pilgrims is rapidly nearing its close. To-morrow it may be said to reach its climax. Then, in the historic city of Gainsborough (whither the party will have traveled from Lincoln, by way of Scrooby, Bawtry, and Austerfield), the American Ambassador will lay the foundation-stone of a memorial church to John Robinson, the "Father" of the Independents who have had so much to do with the making not only of English history, but with that of the United States. A striking feature of to-morrow's ceremony will be the presence of the Rev. W. Robinson, a well-known New York preacher, who traces his descent back to the pioneer pastor of the old Lincolnshire church to which many of the Pilgrim Fathers belonged. It was in Gainsborough Old Hall that the Separatist Church of 1602 was probably organized, and here, by permission of Sir H. B. Bacon, Bart., luncheon is to precede the ceremony of stone-laying. To the lover of literature Gainsborough has attraction as the St. Ogg's of George Eliot's "Mill on the Floss," whilst to the mercantile community this ancient city on "the silver Trent" owes much of its importance to the fact that it is a sub-port of Grimsby.

The London and Provincial Builders' Foremen's Association was formed two years ago, and according to the report there are sixty-four members belonging to it. Several papers on technical subjects have been read and discussed during the year, and smoking concerts held. Applications have been received from Birmingham for the purpose of opening a branch, and many builders in the provinces have applied to the secretary for foremen. At the annual meeting, which was held at the Memorial hall last night, the chairman, Mr. William Ebdon, congratulated the members on the continued prosperity of the association.

BOOKS AND PERIODICALS.

In the FORTNIGHTLY Review for July Miss Olive Schreiner continues her "Stray Thoughts on South Africa" where we find a very interesting account of the South African aborigines; the little "Bushmen," the Hottentots and the stalwart Kaffirs or Bantus, who have not become sufficiently civilized yet to believe in the private ownership of land.

"The idea which to-day is beginning to haunt Europe, that, as the one possible salve for our social wounds and diseases, it might be well if the land should become again the property of the nation at large, is no ideal to the Bantu, but a realistic actuality. He finds it difficult, if not impossible, to reconcile his sense of justice with any other form of tenure. And it is only painfully and slowly (and perhaps never quite successfully!) that under the pressure of autocratic European rule, he is brought to allow, that absolute, individual property in land *may* be consistent with right."

Another infliction of the European upon society is the Halfcaste who Miss Schreiner shows is a deteriorate both from the white and black races, being more unsocial than either, and is therefore a very undesirable breed.

We must quote the following foot note as a rebuke to those morally vacuous persons whose sympathys do not extend beyond their own family or their own country.

"It is curious to note how in the most advanced races and classes, there are cases of singularly arrested moral development. That there are persons who within the circle marked out by blood kinship, will do all and more than all that social feeling can demand, who will even unduly sacrifice themselves and others at the altar of family feeling, yet, who beyond the limits of the family, remain absolute, moral barbarians? Others, and a yet larger number, have their moral growth arrested at the outer limits of national life. Such men may be depended on for moral and socialized action (some times of the very highest kind), where men of their own nation and especially their own class are concerned; they would even be willing to sacrifice life itself for the maintenance of that idealised combination of these men, which forms the national entity, yet, beyond this circle there is absolute moral atrophy! They cannot be depended on for the slightest approach to social actions where persons and nations outside the charmed circle are concerned. They will vaunt themselves on actions directed towards those outside, which within their own circle they would regard as grossly criminal."

Ouida in her usual trenchant style inveighs against the occupation of highways by what she calls "A Highway Robber"—the private railroad. For her peace of mind we hope she will never come to San Francisco, for the robbing of highways has been going on for years here, so that now there is no road even to get out of San Francisco into the country, both of the available routes being occupied by railroads for whose use of the public highway the people get no rent nor any other return.

A notice of this year's Salons is not encouraging, for although 7,000 *objets d'exposition* are exhibited in the two Salons—of the Champs-Elysees and the Exposition des Beau-Arts, "there is a distressing emptiness seeking to hide itself in a dazzle of technical fireworks, and a beating about the bush, not only for artistic conception, but for artistic emotions." "The visitor is wearied by uniformity of standpoint, indisposed by exaggerations of all kinds, or disgusted with horrors depicted in cold blood—horrors convincing neither the painter nor his public."

Although possibly not to such an extent, we find the same thing throughout all civilization at the blazeed end of the nineteenth century. The Pacific Coast being from its isolation more exempt from the moral and artistic leprosy running throughout the older civilizations, we find here a little more decency in our art, although sad to relate an apeing of the ways of decadents is rife here now, and architecture has at last succumbed, and we find an utter absence of imagination in the uniformity of the square box pierced with oblong holes on the one hand and imagination run to seed, in the exaggerated ancient nondescript which seems to be shrieking for recognition in fear that its ugliness may be overlooked—on the other hand. But when this hysterical age has past away—as it will shortly—common sense will reign once more. So we need not despair of the race yet, notwithstanding the alarming symptoms of a whole people gone mad on a question of a trifling increase of the currency; the bankers view of which is presented in the article "Public Sentiment in America on the Silver Question."

Eighth Special Report of the Commission of Labor—THE HOUSING OF THE WORKING PEOPLE. Prepared under direction of Carroll D. Wright, Commissioner of Labor, by E. R. L. Gould, Ph. D.

This is a book of 451 pages devoted as its titles indicates to methods of housing the working people, a class to which it is very difficult to give a distinctive name. A more definite and comprehensive title for it would be "People of Small Incomes" It is prefaced by a "Letter of Transmittal," wherein we find an organic law which shows a proper appreciation of one of the *raison d'etres* of Government which requires to be kept before its officers and the people in general, to counteract the generally received opinion that the Government is for the collection of taxes, for the construction of destructive engines of war, to keep an army and navy, and to issue bonds—and thus they forget the large amount of good work that is done by the peaceful department of the Government—among which we have the Department of Labor. This is the organic law of the department referred to—"To acquire and diffuse among the people of the United States useful information, concerning the means of promoting their material, social, intellectual and moral prosperity," so the author goes on to say "it was deemed particularly appropriate to publish the facts contained in this special report on so important a matter as the Housing of the Working People," and believing that the efforts of the Department in this direction should be made more available to the public we intend to give the gist of the whole report in a series of articles, the first of which appears in this number and will continue the same when we obtain the illustrations with which the report is plentifully supplied. The report is replete with information of interest to the general public, but particularly interesting to architects and builders, and reflects great credit upon its author.

BUILDING CONSTRUCTION AND SUPERINTENDENCE. By F. F. Kidder, C. E., Ph. D., Architect, author of "The Architects' and Builders' Pocket Book." Part I—Masons' Work. Two hundred and fifty illustrations, 409 pp.; one large octavo vol., cloth; price, $4. New York: William T. Comstock.

Although many of our leading colleges have for some time maintained courses in architecture, and several special schools for teaching architecture and building has also been established, it is somewhat remarkable that no complete work descriptive of modern building construction as practiced in this country has as yet been accessible to the would-be architect.

To meet this want was the object of the well-known author of the work before us, and from a study of its contents we believe that his efforts will be highly appreciated by a large class of young men, and also by those whose duty it is to instruct them in this branch of the architectural profession.

As the author has well said in the introduction, the successful practice of architecture requires not only ability to design, but also a thorough knowledge of building construction in all its branches and conscientious and painstaking supervision of the work.

The present volume is devoted to those portions of the builder's work which are classed under the general title of masons' work, including fireproofing and lathing and plastering, although one chapter is devoted to the different forms of iron and steel construction used in supporting walls, especially in buildings of the skeleton type, and such work as comes in intimate connection with the brick and stonework. Other classes of work are to be described in a second volume.

The work is essentially descriptive, only such tables as relate directly to the properties of the materials described being given: the various materials, such as stones, brick, mortars, terra cotta, etc., are clearly and fully described and and the best methods of using them intelligently presented, and in a manner that happily combines the theoretical with the practical.

What we believe will prove an especially useful feature of the book is the large number of cuts illustrating different devices and forms of construction; most of these have evidently been prepared especially for this book, and are eminently the production of a practical architect. We judge that they will prove of much assistance when preparing working drawings.

The suggestions in regard to superintendence embody those points which especially require the personal inspection of the architect, and a great many ways in which unscrupulous builders are apt to slight work or attempt to cover up defects are pointed out in such a way as should prove of much assistance to the young architect.

BUSINESS MOSAICS.

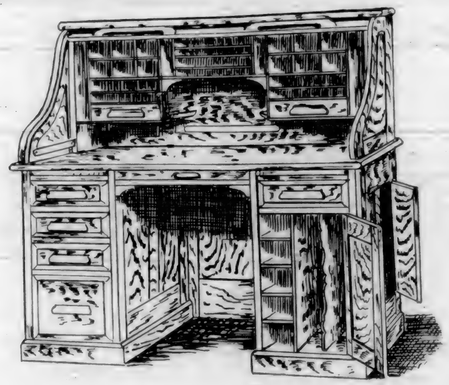
The long established firm of the J. L. Mott Iron Work, so famous for their Imperial Porcelain ware, so well adapted to both the bath room and the kitchen, is well represented in this city by Mr. M. S. James, whose show rooms in the Flood Building, speak for themselves. The Imperial Porcelain ware has a charm for the good housekeeper that nothing else in this line can equal. If you are in doubt what to order call upon Mr. James at his office, 27 Flood Buiiding, and have that doubt removed.

Dobson—Can your daughter play the piano? BUBBUB (wearily)—I don't know whether she can or not, but she does.—*Punch*.

Phœnix Pure Paint holds it own, because it is made of pure materials, white lead, zinc and linseed oil without adulterations, these being finely ground and thoroughly mixed with heavy machinery and cannot fail to produce a first-class article, and the experience of first-class house painters, who fully endorse these claims made by the firm of W. P. Fuller & Co.; manufacturers should set the matter at rest.

Jones—Brooks is dead. BROWN—Well, I'm not surprised to hear. His doctor told me he thought he could straighten him out.—*Life*.

The San Francisco Manufacturing Company deal in California Oak Furniture of their own make as well as Oak flooring. Estimates for Oak Flooring will be furnished by Mr. Charles J. Bruschke, late of Chicago, 644-648 Bryant street, San Francisco. At a time when the community are



almost unanimous for a home market this firm should receive a liberal support, as what they manufacture is the best of its kind, and from California Oak.

To those about to select patent chimneys we would say before you select what you want, call upon L. E. Clawson & Co., 1340 Market street, telephone, south, 257. Clawson's Patent Hood or throat and arch-bar combined, makes the bricklayer conform with mantel-men's work, and guarantees you a safe chimney with a perfect draught.

Professor—Give me the names of the bones that form the human skull. MEDICAL STUDENT—I've got them all in my head, but I can't recall their names.—*New Letter. Life.*

Merchant's Gothic tin shingles and Merchant's combination skylight "Star" Ventilator are becoming so well known among architects as being reliable and storm-proof, it is hardly needed to call attention to the merits claimed by the manufacturers, which are that the "Star" Ventilator is not a compromise between a first-class ventilator and a poor skylight, but the best of both, as it gives light and ventilation simultaneously. Oscar S. Levy, Agent, 205 Market street, San Francisco, Cal.

Trolly President—How does that new fender work? SUPERINTENDENT—I never saw anything like it. They never know what strikes them.—*Life*.

Samson Cordage Works have certainly adopted a very appropriate name for their cord, as strength combined with a cord warranted free from waste and imperfections is what is wanted in a window cord. Send for samples to the Sansome Cordage Works, Boston, Mass., if you are not already familiar with the merits of the article.

Blenkington—I wonder why "churchyards yawn," as Shakespeare says? PEMBERTON—Probably the epitaphs of deceased millionaires make them tired.—*Truth*.

Wm. Wolff & Co. announce they have just received a fresh arrival of Alsen Portland Cement, and for deliveries direct from shipside will make an exceptionally low price on any quantity required. This cementis so well known that it presents a favorable opportunity to provide the best article at a low price, 329 Market street, San Francisco, is thir office.

"Is this a 16 to 1 town? asked the drummer. "It air on Sunday," answered the native. "On Sunday?" "Yes. Sixteen goes fishiu' to one goin' to church."—*Troy Times*.

Roche Harbor Lime was awarded First Prize at the World's Fair, also first prize at New Orleans, Washington and California. For particulars address Tacoma and Roche Harbor Lime Co., box 289 Builder's Exchange, 40 New Montgomery street, San Francisco.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

CONTRACTS OF COUNTIES—LIMIT OF INDEBTEDNESS.—Where a county contracts for the erection of a building, the payment to be made in installments each year as the work progressed, the debt or liability created is not the aggregate amount of such installments, but only that which arises froN year to year on the separate installments; and if the installments: and if the installment is within the income each year it is not illegal, under a provision of law forbidding counties to incur an indebtedness or liability in any year exceeding the income and revenue provided for that year.

Smilie v. Fresno County, Supreme Ct. Cal., 444 Pacific Rep. 556.

LIEN FOR MATERIAL DELIVERED IN INSTALLMENTS.—In an action to enforce a material man's lien, where a contract was made for material to be delivered from time to time, as required in the repairs of the buildings, and the materials in accorance therewith is furnished as orders for same are received, each order is not an indepentent contract, so as to reqiure a separate lien to be filed within the required time after the delivery of each order.

Premier Steel Co. v. McElwaine-Richards Co., Sup. Ct. Ind., 43 Northeastern Reporter, 877.

ENFORCING LIEN AGAINST CORPORATION RECEIVING PROPERTY.—A contractor who erected a creamery building under a contract signed by a number of individuals, each of whom signed for a specific sum, binding himself only to that extent, may after the subscribers have organized into a corporation, which is vested with title to the property, maintain a single action to enforce a mechanic's lien on the property for the amount of the unpaid subscriptions, although neither the corporation nor the stockholders who paid their subscriptions are bound by the indebtedness.

Davis & Rankin Co. v. Viee, App. Ct. Ind., 43 N. E. Reporter, 889.

ENFORCEMENT OF LIEN AGAINTS PROPERTY FRAUDULENTLY TRANSFERRED.—Where the right to a lien exists, a conveyance of the property by the owner will not defeat the lien, if it appears that the conveyance was not bona fide.

N. Y. Lumb & Woodworking Co. v. 73d Street Bldg. Co., Sup. Ct. App. Div. 1st Dept., 38 N. Y. S. Reporter, 869.

WHEN THERE MUST BE WRITTEN CONTRACT IN LOUISANA.—Where a demand exceeds $500 for labor and materials in building an addition to and making repairs on a house, there must be a written contract, as against third persons, registered according to the laws of Louisiana.

Murry v. Sweeney, Sup. Ct. La., 19 Southern Reporter, 753.

CITY BUILDING NEWS.

Alvarado near Douglass. Cottage; owner, Jacob Heyman; builder, Jacob Heyman; cost $2000.

Baker and Fulton. Three-story frame; owner, Ernst D. C. Rohde; architects, Martens & Coffey; contractor, M. Loftus; signed, Aug. 7; filed, Aug. 8; cost $6900.

Berry Place near Grant Ave. One-story brick; owner, M. Rene; builder, J. Salanve; cost $1000.

Brannan near 4th. Plastering for St. Rose's Church; owner, Rev. D. Nugent; architect, B. J. Clinch; contractor, P. J. O'Leary; cost $3845.

Brannan near 4th. Two-story frame; owner, Anna E. Davis; contractor, John Wikman; signed, July 1; filed, July 8; cost $2150.

Broadway near Fillmore. Excavations, etc.; owner, P. Anspacher; architect, M. J. Lyon; contractor, G. W. Werner; signed, June 30; filed, July 6; cost $1445.

Broadway near Fillmore. Carpenter, mill and iron; owner, P. Anspacher; architect, M. J. Lyon; contractor, J. A. Smilie; signed, July 12; filed, July 18; cost $6400.

Broadway near Fillmore. Plumbing, etc.; owner, P. Anspacher; architect, M. J. Lyon; contractors, Ickelheimer & Bros.; signed, July 17; filed, July 18; cost $1097.

Bush and Dupont. Repairs and addition; owner, Mrs. Hannah Keesing; contractor, Stephen Canning; signed, July 21; filed, July 23; cost $1050.

California near Leidesdorff. Alterations and repairs; owner, Merchant's Ex. Ass. of San Francisco; architects, J. J. & T. D. Newsom; contractors, Moore & Cameron; signed, July 14; filed, July 14; cost $1385.

California Ave. near Virginia Ave. Alterations and additions; owner, Mrs. Mathielde Schroeder; contractor, R. Faby; signed, July 20; filed, July 21; cost $1350.

California and Polk. Interior finish; owner, W B. Bradbury; architect, F. B. Wood; cntractors, L. & E. Emanuel; signed July 8; filed, July 25; cost, $2850.

Capp near 23d. Two-story frame; owner, W. H. George; contractors, Marcuse & Remmel; signed, July 20; filed, July 24; cost $2565.

Clay near Drumm. Alterations and additions, owner, Martha J. B. Thomas; architect, T. J. Welsh; contractor, A. L. Campbell; signed, July 11; filed, July 15; cost $1220.

Clay near Drumm. Concrete, etc; owners, Martha J. B. & W. B. Thomas architect, T. J. Welsh; contractor, Geo. Goodman: signed, July 11; filed July 16; cost $2725.

Clayton and Fell. Interior work; owner, Mr. W. McPhee; architect, S. Newson; contractor, Home Mnfg. Co.; cost $2500.

Clayton near Frederick. Two-story frame; owner, Wm. Bernstein; contractor, White Bros.; signed, July 16; filed, July 18; cost $2510.

Colusa and Connecticut. Two-story frame; owner, Claus Reimers; architect, D. C. Coleman; contractor, John Person; signed, July 18; filed, July 20; cost $2469.

Courtland Ave. near Bernington. Cottage; owner, Peter Rolle; contractors, Reit & Ahlgren; signed, July 15; filed, July 17; cost $1325.

Courtland Ave. and Andover. Heating and ventilating; owner, Board of Education; architect, C. I. Havens; contractor, Montague & Co.; signed, July 11; filed, July 17; cost $1598.

Dupont near Bush. Alterations and repairs; owner, G. Mussett; contractor, J. Salamave; cost $1000.

Eleventh Ave. near Lake. Cottage; owner, Mr. & Mrs. F. A. Dixon; contractors, Weste & Fern; signed, Aug; filed, Aug. 8; cost $1800.

Ellis and Pierce. Two-story frame; owner, Johanna McGinn; architect, H. Geilfuss; contractor, J. J. Mausenu; signed, Aug. 6; filed, Aug. 6; cost $5255.

Ellis near Powell. Underpinning; owner, J. H. Mangels; architect, Henry Geilfuss; contractor, F. Wagner; signed, July 18; filed, July 20; cost $2150.

Eureka and 19th. Cottage; owner, Hugh M. Cochran; contractor, W. W. Rednall; signed, July 14; filed, July 15; cost $1850.

Eureka near 19th. Cottage; owner, J. J. Bradley; contractor, W. W. Rednall; signed, July 15; filed, July 18; cost $1700.

Fair Oaks near 24th. Additions and alterations; owner, John J. Wall; architect, J. T. Kidd; contractor, M. Lotus; signed, July 3; filed, July 31, cost $1525.

Filbert and Kearny. Bulkhead for school house; owner, Board of Education; architect, C. I. Havens; contractor, J. H. McKay; signed, July 27; filed, July 31; cost $4710.

Filbert near Jones. Bulkhead, etc.; owner, Board of Education; architect, C. I. Havens; contractor, W. Linden; signed, July 8; filed, July 17; cost $987.

Fifteenth Ave. near California. To build; owner, Emile A. Allen; contractor, J. B. Glunz; signed, July 11; filed, July 14; cost $2482.

Florida near 20th. To build; owner, Henry M. Colety; architect, D. V. Devel; contractors, Williams & Foster; signed, Aug. 1; filed, Aug. 3; cost $1500.

Ford near 17th. Additions and improvements; owner, Sergeant P. Shea; contractor, James McInerny; cost $2000.

Fourteenth near Howard. To build; owner, Leon Levy; architects, Shea & Shea; contractors, White Bros.; signed, Aug. 1; filed, Aug. 4; cost $2140.

Fremont near Howard. Grading, etc.; owner, Judson Mnfg. Co; architects, Percy & Hamilton; contractors, Richardson & Gale; signed, Aug. 4; filed, Aug. 7; cost $10,075.

Geary and Stockton. Six-story brick building; owner, Spring Valley Water Works; architect, Clinton Day; contractor, John McCarthy; signed, Aug. 5; filed, Aug. 10; cost $89,716.

Geary and Stockton. Granite work for six-story brick; owner, Spring Valley Water Work Co; architect, Clinton Day; contractor, Raymond Granite Co.; signed, July 10; filed, July 14; cost $24,000.

Geary near Larkin. Grading, etc., for three-story brick; owner, Louis Bazet; architect, C. R. Wilson; contractor, R. W. Beattie; signed, July 21; filed, July 22; cost $3152.

Geary near Larkin. Carpenter work for three-story brick; owner, Louis Bazet; architect, C. R. Wilson; signed, July 31; filed, Aug. 3; cost $2375.

Gough near Fulton. To build; owner, Claus Schroeder; architect, J. E. Kraft; contractor, A. G. Johnson; signed, July 20; filed, July 24; cost $2963.

Grove near Baker. To build; owner, Mrs. Christina Ott; contractor, J. J. Mausean; signed, Aug. 6; filed, Aug. 7; cost $3800.

Haight street, No. 1166. Painting; owner, A. Loprosti; architect, W. J. Cuthbertson; contractors, Scott & Wilkinson; signed, July 20; cost $250. Electric work; contractor, Hetty; cost $80.

Howard near 10th. To build; owner, Mrs. Mary Hoban; contractor, Geo. Letterell; signed, July 21; filed, July 23; cost $1850.

Howard near 25th. To build; owner, Mrs. Olive A. Harper; architect, C. J. Coffey; contractor, E. Cox; signed, Aug. 8; filed, Aug. 10; cost $3660.

Hyde near Pacific. Two-story frame; owner, Peter Mulligan; architects, Mahoney & Ryland; contractors, Westerlund & Sundeen; signed, July 2; filed, July 21; cost $2882.

Jackson near Pierce. Alterations and additions; owner, Mrs. M. A. Forbes; architect, A. J. Barnett; contractor, W. Patterson; cost $960.

Lake and 7th Ave. Carpentry, mill work, etc., on two-story brick; owner, Maria Kip Orphanage; architects, Percy & Hamilton; contractor, Thos. H. Day & Son; signed, July 31; filed, Aug. 1; cost $17,572.

Lake and 7th Ave. Brick, sandstone, etc., for two-story brick; owner, Maria Kip Orphanage; architects, Percy & Hamilton; contractor, Thos. Butler; signed, July 29; filed, Aug. 1; cost $13,061. Excavations, concrete, etc.; contractors, Kentinge, Leonard & Ransome; cost $3000. Plumbing; contractor, Shepard Bros.; cost $2200.

Lower Terrace near Serpentine Place. Cottages; owners, J. F. and Charlott V. Bird; contractor, C. Doughass & Co.; signed, July 18; filed, July 21; cost $1260.

Lyon near Jackson. Cottage; owner, H. F. Muller; architects, Kenitzer & Barth; contractor, M. J. Savage; signed, Aug. 5; filed, Aug. 6; cost $2235.

Market and 3d. Safes; owner, Claus Spreckels; architects, Reid Bros.; contractor, Herman Safe Co.; signed, July 19; filed, Aug. 3; cost $4129.

Market and Powell. Bar and office fixtures for Baldwin Hotel; owners, O. Norman & A. E. Iverson; architect, E. Kollofrath; contractor, Home Manfg. Co.; signed, July 30; filed, Aug. 3; cost $1300.

McAllister near Willard. To build; owner, D. J. McCreedy; architect, D. C. Coleman; contractor, J. E. Schulz; signed, July 15; filed, July 16; cost $1975.

Montgomery Ave. near Powell. Three-story frame; owner, G. Chiappari; architect, E. Depierre; contractor, A. Caccia; signed, July 15; filed, July 15; cost $3834.

Natoma near 2d. Training school for girls; owner, L. Melzger; architect, S. W. Bugbee; Superintendent, G. H. Moore; cost $4000.

New City Hall. Art glass for the dome; owner, City of San Francisco; architect, Frank T. Shea; contractor, American Decorative Co.; cost $16,500.

Nineteenth near Eureka. Cottage; owner, J. F. Boehm; contractor, W. W. Redmall; signed, June 30; filed, July 14; cost $500.

Oak near Clayton. Cottage; owner, H. Herningson; architect, A. C. Lutgens; contractor, Adam Miller; signed, June 22; filed, July 23; cost $2160.

Pine near Pierce. To build; owner, William H. Saunders; contractor, John B. Glurz; signed, Aug. 4; filed, Aug. 5; cost $2950.

Powell near O'Farrell. Three-story brick; owner, George D. Toy; architects, Herman & Swain; contractor, J. A. Wilson; signed, July 20; filed, July 21; cost $17,075.

Powell and Ellis. Painting for four-story brick; owner, Royal Eagle Distilleries Co.; architects, De Prosse & Meussdorffer; contractor, C. Schutt; signed, July 31; filed, Aug. 4; cost $1200.

Presidio. Two brick barrack buildings; owner, U. S. Government; contractor, M. McGowan; cost $74,700.

Powell and Ellis. Excavations, brick and iron work for four-story brick; owner, Royal Eagle Distilleries Co.; architects, DeProsse & Meussorffer; contractor, F. Wagner; signed, July 6; filed, July 6; cost $22,370. Carpentery, mill work, etc.; contractor, C. Schutt; signed, July 6; filed, July 6; cost $18,975. Wrought iron and cast iron work; contractor, F. Wagner, sub-contractors, Brode & Clark; cost $7275. Plumbing; contractor, H. Williamson; cost $1725. Gas-fitting; contractor, H. Williamson; cost $4085. Plaster and cement; contractor, C. F. Schiller; cost $3500. Plastering, etc.; contractor, W. C. Watson; cost $8225. Concrete work; contractors, Slack & Gussel; cost $2850. Ornamental iron work; Todd & Peters; $935. Heating apparatus, etc; contractor, J. G. Graniss & Co.; cost $1385.

Sacramento near Marble. Two-story brick hospital; owner, T. T. Williams; architect, A. C. Schweinfurth; contractors, Richardson & Gale; signed, June 30; filed, July 3; cost $16,445. Plumbing; contractor, James E. Britt; cost $1000. Wiring for electric lights, cost $148. Heating and ventilating; Holbrook, Merrill & Stetson; cost $950. Combination electric and gas fixtures; S. F. Novelty and Plating Works; cost $275.

Shipley near 4th. Two-story frame; owner, Wm. Crane; architect, A. J. Barnett contractor, L. M. Hickson; signed, June 29; filed, July 3; cost $2350.

Shotwell and 24th. To build; owner, John F. Schome; architects, Martens & Coffey; contractor, J. Bucher; signed, July 30; filed, July 31; cost $1725.

Stanyan near Carl. To build; owner, Mrs. Lydia M. Ebatt; contractors, Marcuse & Remmel; signed, July 29; filed, July 30; cost $1780.

Stanley Place near Harrison. To build; owner, Thomas Green; architect, W. H. Armitage; contractor, L. B. Schmid; signed, Aug. 4; filed, Aug. 6; cost $4070

Stevenson near Ecker. To build; owner, Pacific Power Co.; architect, Ira Bishop; contractors, Cushing, Wetmore Co.; signed, July 21; filed, July 27; cost $1800.

Stockton near Greenwich. Alteration and additions; owner, Mrs. Rosina Lornetti; contractor, H. T. Grieb; signed, July 8; filed, July 9; cost $1875.

Stockton near Union. Plumbing, etc.; owner, Balthazer Huth; architects, De Prosse & Meusdorffer; contractor, H. Ernest; signed, July 28; filed, Aug. 5; cost $540.

Stockton near Union To build; owner, Bathason Huth; architects, De Prosse & Meussdorffer; contractors, A. Caccia & Co.; signed, July 27; filed, July 28; cost $4210.

Sutter near Buchanan. All work except plumbing, etc.; owner, Elish Brooks; architect, W. H. Wharff; contractor, Jacob Schuler; signed, Aug. 3; filed, Aug. 3; cost $1300.

Thirteenth near Howard. To build; owner, B. F. Harvey; architect, C. M. Rousseau; contractor, R. J. Pavert; signed, July 1; filed, July 3; cost $5000.

Tremont near Frederick. Cottage; owners, Bertha & Ernest Kriske; contractor; L. Ceregnino; signed, Aug. 10; filed, Aug. 10; cost $1160.

Twenty-first and Hampshire. Cottage; owners, John and Louise Sanderson, contractor, M. A. Stewart; cost $1272.

Twenty-second and York. To build; owner, F. Lurmadn; architect, F. Rabin; contractor, H. Munster; cost $7000.

Twenty-second near Minnesota. To build; owner, C. J. Jackson; contractor, R. O. Davis; signed, July 14; filed, July 17; cost $2450.

Utah near Santa Clara. Cottage; owner, O. Dahlton; contractor, L. B. Schmid; signed, July 16; filed. July 17; cost $1410.

Utah near Sonoma. To build; owner, Augusta C. and Mary Pratt; contractor, Thomas F. Michell; signed, Aug. 4; filed, Aug. 4; cost $1450.

Utah near El Dorado. To build; owner, Rosie Kiernan; architect, T. J. Welsh; contractor, Doyle & Son; signed, Aug. 7; filed, Aug. 7; cost $1349.

Van Ness Ave. and Clay. Marble mantels, bronze fire frames, etc.; owner, Claus Spreckles; architects, Reid Bros.; contractors, Patterson & Eisele; signed, July 22; filed, July 31; cost $12,200.

Van Ness and Fulton. Alterations and additions; owner, I. Selig; architect, M. J. Lyon; contractors, Elder & Jordan; signed, July 2; filed, July 6; cost $650.

Van Ness Ave. and Fulton. Concrete foundation, etc.; owner, I. Selig; architect, M. J. Lyon; contractor, G. W. R. Trester; signed, July 3; filed, July 6; cost $1400.

Van Ness Ave. and Broadway. Church Edifice; owner, St. Bridget's Congregation; day's work; cost $20,000.

Valencia near 21st. To build except plumbing; owner, J. W. Salter; architects, Martens & Coffey; contractor, J. Bucher; signed, July 8; filed, July 9; cost $5652.

Valencia near 21st. Plumbing etc; owner, J. W. Salter; architects, Martens & Coffey. contractor, H. Hufschmidt; signed, June 25; filed, July 9; cost $743.

Vallejo near Pierce. To build; owner, John Simpson; architects, Coxhead & Coxhead; contractor, C. M. Depew; signed, July 17; filed, July 18; cost $8050.

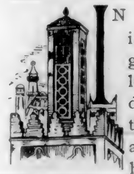
PREMISES OF NEW SAN FRANCISCO POST-OFFICE, AUTHORIZED BY ACT OF CONGRESS, MARCH, 1887.

EXISTING POST-OFFICE BUILDING AT SAN FRANCISCO, CALIFORNIA.



IN ANOTHER part of our journal reference is made to the part taken by the national government of the British Kingdom in loaning money to municipalities and individuals, in fact becoming the bankers for the people. Such a terrible cataclysm as that, leads to the holding up of ones hands in holy horror in free America. It is the taking of the bread and butter out of the mouths of the money lenders, the Saviors of the poor farmers and the benefactors of public communities and bodys who wish to make improvements. Why! such a thing as that would do away with bonds!

State it not above a breath—for how could we exist without bonds—and how could the money holder exist without them, and if he was to go we all would have to lie down and die.

Alas! please don't talk about that abominable foreign, British System of the Government loaning its money to counties and cities; and that still greater abomination to

private individuals to allow them to make improvements for the good of the community. Why if the people got an inkling of this, to what use should we put those great vaults at Washington and elsewhere; stacked up with gold and silver coin. Their cost would be thrown away.

And then the stock of money to pay for those huge engines of destruction the three new battle ships, might possibly be spent in some useful and renumerative work such as the Nicaragua Canal or laboring and manufacturing establishments for the unemployed and that wouldn't do you know.

HOUSING OF PEOPLE OF SMALL INCOMES.

No. 2.

THE LAWS relating to tenement and lodging houses in New York city are very full and quite severe. Some of them might be introduced in the City of San Francisco with advantage—*e. g.*, that section against the covering a whole lot with buildings—for even in this city where we have the whole peninsula to build upon we find plenty of cases where practically the whole lot is covered with buildings and inadequate light and air allowed to rooms. This is part of the section referred to:

"Sec. 661 (as amended by chapters 84 and 288, laws of 1887). It shall not be lawful hereafter to erect for, or convert to the purposes of a tenement or lodging house, a building on any lot where there is another building on same lot, or to build, or to erect any building on any lot whereon there is already a tenement or lodging house, unless there is a clear open space exclusively belonging thereto, and extending upward from the ground of at least ten feet between said buildings if they are one story high above the level of the ground; if they are two stories high, the distance between them shall not be less than fifteen; if they are three stories high, the distance between them shall not be less than twenty-five feet; but when through ventilation of such open spaces can be otherwise secured, such distances may be lessened or modified in special cases by a permit from the board of health. At the rear of every building hereafter erected for or converted to the purposes of a tenement or lodging house on any lot, there shall be and remain a clear open space of not less than ten feet between it and the rear line of the lot, but this provision may be modified as to corner lots in special cases by a permit from the board of health. No one continuous building shall be built for or converted to the purposes of a tenement or lodging house in the city of New York, upon an ordinary city lot, and no existing tenement or lodging house shall be enlarged or altered or its lot be diminished so that it shall occupy more than sixty-five per centum of the said lot, and in the same proportion if the lot be greater or less in size than twenty-five feet by one hundred feet; but this provision shall not apply to corner lots, and may be modified in other special cases by a permit from the board of health."

The following are also very wholesome provisions as to light and air:

"The total area of window or windows in every room communicating with the external air shall be at least one-tenth of the superficial area of every such room; and the top of one-at least, of such windows shall not be less than seven feet six inches above the floor, and the upper half, at least, shall be made so as to open the full width. Every habitable room of a less area than one hundred superficial feet, if it does not communicate directly with the external air, and is without an open fireplace, shall be provided with special means of ventilation, by a separate airshaft extending to the roof, or otherwise, as the board of health may prescribe. Every room used, let, or occupied by any person or persons for sleeping shall have at least one window, with a moveable sash, having an opening of not less than twelve square feet, admitting light and air directly from the public street or the yard of said house, unless sufficient light and ventilation shall be otherwise provided, in a manner and upon a plan approved by the board of health."

In this city and we presume in the other cities of the Pacific slope we have a nuisance to contend with in the allowance of stables for animals in the midst of a residence block. This should not be allowed, as they are a nuisance to the inhabitants of the surrounding dwelling houses, if not a source of unhealthiness. Some provision should be made by which certain blocks in each district should be devoted to this purpose and no stables allowed except in these blocks.

Until this time comes stringent regulations should be made to keep their contiguity as little as possible a nuisance to the olfactory nerves of those around.

"In New York the board of health has published for the benefit of its inspectory and the public a list of recommendations commonly made to cover certain classes of complaints. They may be considered as types, so to speak, and afford to all interested a simple and speedy method of dealing with insanitary features."

This one in regard to stables is worthy of adoption by our local boards.

"C. That the stable floor and space beneath is not properly drained, and said floor is defective, and the leakage through the same renders the earth beneath very filthy and offensive. R. That all offensive earth be removed from beneath the stable floor, the ground space cleaned, disinfected, cemented, and so graded and drained that all surface water and liquid matter shall be discharged into the street sewer by and through a properly trapped, extra heavy iron drain; thst the floor of horse stalls be provided with a valley drain properly trapped and connected with the sewer connected drain."

The sanitary laws of the large towns of Great Britain are built upon the same lines as New York—the only difference being that to prevent any abuse of right of entry upon private premises, provisions are made that in the rural districts—"Power to enter a house or part of a house used as a dwelling without consent of the inhabitant or without a warrant from a justice is not given."

"Entry on premises for the purpose of examining the conditions of water-closets, ash-pits, water supply, and drainage is allowed at any reasonable time of the day after twenty-four hours previous notice to occupiers, or, if the dwelling is unoccupied, to the owner. This notice may be dispensed with in cases of emergency."

Sanitary matters have not advanced so much in other countries as in the English speaking ones, and there doesn't appear much to learn from the sanitary laws of France, Belgium or Germany; they are interesting to the comparative ethnologist as showing the different ways of getting at the same things adopted by different nationalities.

Chapter III is on Expropriation for Sanitary Purposes and commences in this fashion:

"When houses or neighborhoods become irremediably bad, the only logical thing to do is to wipe them out of existence. It is true this form of procedure is costly, but late awakenings are always expensive. The supreme necessity of safeguarding public health is a sufficient motive for action, but the welfare of individual dwellers is also happily subserved. The right of expropriation is a weapon of last resort, and perhaps alone can efficiently check the unscrupulous rapacity which allows property to degenerate into an incurably unhealthy state."

This dictum is being acted upon by our present San Francisco Board of Health in abolishing the rookeries of Chinatown, which action has received the unanimous approval of the people. Even in such a young city as San Francisco such a course has become necessary—so it is easy to imagine the necessity of such action in a city a thousand years old, such as London—So a comprehensive act was passed by the British Parliament in 1890 called the "Housing of the Working Classes Act":

"The first part of this law relates to unhealthy areas, and is limited in its application to cities and towns. Rural sanitary districts are excepted. It provides that whenever an official representation is made to the local sanitary authority that 'within a certain area in the district of such authority either any houses, courts, or alleys are unfit for human habitation, or the narrowness, closeness, and bad arrangement, or the bad condition of the streets and houses or groups of houses within such area, or the want of light, air, ventilation, or proper conveniences, or any other sanitary defects, or one or more of such causes, are dangerous or injurious to the health of the inhabitants either of the buildings in the said area or of the neighboring buildings; and that the evils connected with such houses, courts, or alleys, and the sanitary defects in such area can not be effectually remedied otherwise than by an improvement scheme for the arrangement and reconstruction of the streets and houses within such area, or of some of such streets or houses, the local authority shall take such representation into their consideration, and if satisfied of the truth thereof, and of the sufficiency of their resources, shall pass a resolution to the effect that such area is an unhealthy area, and that an improvement scheme ought to be made in respect of such area, and after passing such resolution they shall forthwith proceed to make a scheme for the improvement of such area.' The official representation must be made by the medical officer of health, who makes his inspection upon the complaint of two justices of the peace or twelve taxpayers. Should he fail in his duty, the complainants may appeal to the local government board, or if the area is in London, to the home office. The local authorities, in connection with their scheme, must submit maps, particulars, and estimates. They may exclude any portion of the area or include contiguous territory, as their judgment may dictate. Proper sanitary arrangements must be provided, and also (and this is a very important fact to note) accommodations for the working classes displaced by the proposed plan. The scheme must distinguish the lands proposed to be taken compulsorily. Compulsory purchase need not be resorted to if the owner of the freehold confers with the local authority and makes the required ameliorations under the superintendence and control of the local authority. The scheme, when formulated, is publicly advertised, and notice is given to owners and occupiers. It is then laid before the local government board or home office, as the case may be, whose duty it is to make a local inquiry. If approval is given, the appropriate organ of government submits the scheme to Parliament for confirmation by special enactments. If there is opposition, reference is made to a committee of either House of Parliament for confirmation by special enactments, and costs are awarded there against promoters or opposers accordng as the opposition is considered to have been justified or not Wherever the local authorities decline to act upon an official representation they must file their reasons with the confirming body, who will immediately direct the holding of an investigation.

"If the scheme relates to London, a statement must be made of the provisions for accommodating as many persons of the working classes as may be displaced either within the area or immediately outside, unless the confirming power shall be satisfied that equally convenient accommodation is offered elsewhere. Should special circumstances exist, only one-half of the persons displaced need be provided for. In any other city outside of London the local government board may require that displaced parties, working people, may be accommodated either within or without the area under consideration.

"It is important to note that special care is taken by this law of the housing of working people. All undue hardship accompanying their displacement is effectually guarded against. As working people can not be displaced without more or less inconvenience, cordial recognition is given to the necessity of their being properly cared for within the district which, from reasons of contiguity to employment or special facilities of access, they have chosen to make their residence. In this respect the act is in a measure unique. These provisions furnish also the explanation of the fact that some English cities in undertaking the improvement of insanitary areas have built and rented house accommodations for working people. These requirements have been followed, not for the purpose of engaging in socialistic schemes, but with the idea of recognizing the justice of the workingman's necessity of being near his place of toil. In almost every instance, if not in every case, steps have been taken to induce private parties to purchase the land and build suitable dwellings. When these efforts have failed, after a threefold attempt has been made, as in London, the municipalities themselves intervene to fulfill the mandatory provisions of the law. Individuals and building companies have usually asserted that the requirements as to new buildings were such as to preclude the possibility of proper financial return upon the investment. In many instances at least the land has been offered at a figure from which the cost of demolition has been eliminated. This practice, which seems entirely equitable, is based on the view that the whole cost of improvement should not appear in the rent charged to future tenants. The expropriation and demolition of insanitary areas entail benefit to the entire community, and it is but fair that the community as a whole should bear a moderate portion of the cost."

The author seems desirous of removing the taint of Socialism from these schemes of the municipalities providing homes for the people. He must recognize the fact, however, that it was not until the Social Democracy of England had made the British public familiar with these

ideas that the authorities dared to look into the face of a creature of such fearful mien:

"After the improvement scheme has been confirmed, the local authorities are empowered to sell or lease the land acquired to any person who undertakes to carry out the stipulations enjoined. Local authorities themselves may only engage in rebuilding with the sanction of the local government board. The price paid for land must be a fair market value as assessed under the land clauses acts, no allowance being made because the purchase is compulsory. Where nuisances have existed, deduction is made for the sum it would have been necessary to spend for abatement or to put the buildings into repair. Where the premises are unfit for human habitation, the compensation covers simply the value of the land and materials. The lands required are to be purchased either by mutual agreement or upon arbitration. Lands owned by the local authority may be used for providing accommodation to displaced workmen, or if an insufficiency of accommodotion of this sort exists, suitable sites may be purchased. Expenses of improvement schemes are defrayed either from local taxation or from special loans. There exists in England a body known as the public works loan commission, and this is the source from which borrowed money may be obtained upon recommendation of the confirming authority. The period of repayment is fixed at fifty years as a maximum. Three and one-half per cent is the interest charged upon money borrowed from the public works loan commissioners."

Here we have one of the secrets of the phenominal success attending on all municipal improvements in the British Kingdom. Instead of the municipalities being at the mercy of private money lenders and being in bonds to them—the National Government itself loans out its surplus money at a low rate of interest to them, and thus they have never to go to foreign countries for their capital, the people really simply paying their interest to themselves on the same principal as the Building and Loan Associations.

Part II of this act of 1890 deals with unhealthy dwelling houses a matter which we need not dwell upon here—as it has been already considered in our last number.

Part III relates to providing lodging houses for working people which allows of the acquisition of land and the erection of buildings thereon or the alteration of existing construction to become lodgings for working people.

"Expenses incurred by a local authority in the execution of this part of this act are borne in London by the dwelling house improvement fund; in other urban communities as part of the general expenses in the execution of the public health acts. If it is found that any lodging houses, after seven years, dating from their acquisition or erection, are not necessary or are too expensive, they may be sold. Any railway company, or dock or harbor company, or any other company, society, or association established for trading or manufacturing purposes and employing persons of the working class, is granted the authority to build houses for such persons in their employment. In order to encourage enterprise of this sort the public works loan commissioners are authorized to lend money, repayable within a period of forty years, to companies or to private owners of land, not exceeding one-half of the value of the estate. The rate of interest is fixed by the commissioners of the treasury, but may not be less than 3½ per cent."

Another example of where the nation becomes the banker for the people.

THE ST. JAMES OFFICE BUILDING SCHEME.

THE row which has occurred between the promoters of the project to put up a fifteen-story office building on the site of the St. James Hotel, which has got in to court in a controversy over a division of profits, has brought to light about as clever a scheme for floating a big enterprise on wind as this city has seen in many a day. The men who conceived this idea and who are now quarreling over the profits are H. Durant Cheever, manager of the Okonite Company (limited), of 253 Broadway; Charles A. Cheever, who used to be connected with the New York Belting and Packing Company; Dwight W. Bowles, son of the editor of the Springfield *Republican*, and a newspaper man in this city, and one John L. Martin. As far as can be learned, these four clever men conceived the idea that it would be a good thing to put up a big office building somewhere about the neighborhood of Broadway and Twenty-sixth or Twenty-seventh street. The fact that none of them had the two or three millions that such a building would cost was not to stand in the way of the scheme. The four set to work, first to find a site, which could be secured for purchase, and finally purchased upon satisfactory conditions. Then it became necessary to find some one to advance the binding money to hold the land, an architect who would draw plans of the building, some monetary institution which would lend all that was needed, and a builder who would take a contract for the construction of the building and accept part of his pay in bonds and stocks of a corporation which was to be formed to stand as owner of the building. That success was attained in all of this appears to be true, for it is upon this allegation that the Cheevers and Bowles are suing Mr. Martin.

They allege that when the final negotiations took place, for certain reasons this work was left to Martin, who was to act in his own name. Martin carried on the negotiations successfully and made a profit out of them, but instead of offering to divide up $100,000 or so, which his partners believed he would have for them, he only acknowledges having made a profit of about $5,000. That there was a possibility of a profit of $100,000 in merely organizing a scheme to put up a big building without a dollar of capital is interesting. According to Mr. G. W. Brooks, who is counsel for the plaintiffs, there should have been three sources for this profit. The first of these was from the custom of land owners to pay a commission for the making of a sale of this land. The St. James Hotel belonged to the Spofford estate. It is assumed that the Spofford estate paid the usual one per cent commission for the sale of the hotel and its site, and that Mr. Martin arranged to get half of this commission for himself and his associates. This might have been either in cash or bonds, for the Spofford estate was to take part of its pay in bonds. The contractor who was to build the house would take part of his pay in stock and bonds, and in this way a margin of equality would be left upon the new building and its site to make it possible to borrow money for purchase and building. The second source of profit alleged was from borrowing the money. This had been arranged with a big life insurance company through a broker, and it is assumed that the broker divided his customary one per cent commission with Mr. Martin. The third source of profit was more direct. In order to get possession of the property it was necessary to pay $50,000 down. This, it is alleged, was borrowed from a man in Philadelphia, and he was to get a bonus for its use, and when the money was raised from the insurance company and the property transferred to the newly formed St. James Company, it is assumed that in making the trasfer that the property went to the new company at a profit of $75,000 or so over what the Spofford estate was to get for it. Out of this profit, which was to be collected in bonds and stock, the man in Philadelphia was to get his bonus, and the rest was to be devided among the projectors of the scheme.

Such, in a general way, was the scheme as it was told by Lawyer Brooks Tuesday. Mr. Martin's side of the story has not been made public yet. The hearing of the motion to enjoin him from collecting any of the commissions or profits arising from the transactions mentioned will be had on Friday.—*New York Sun.*

PHOTOGRAPHY IN COLORS.

THE discovery of the secret of photography in colors is the latest triumph of scientific research. The artist can now take instantaneous pictures in as many as seventeen colors, and an interesting coincidence in connection with the discovery of this secret is the remarkable fact that two investigators, widely separated and entire strangers to each other, made the discovery at about the same time. James W. McDonough, of Chicago, worked on the problem for thirty years, and only recently succeeded in solving it, and applied for a patent at Washington. In the meantime Professor Jolly, a scientist of Dublin, had been experimenting, solved the same problem, and also applied for a patent, being greatly astonished to learn that McDonough was ahead of him in making the application. The latter's claims were allowed, and Professor Jolly received a satisfaction fee; he also secured the London patent.

The Natural Color Photographing and Printing Company has already been incorporated under the laws of Virginia, with a capital of $500,000, with the privilege of raising it to $5,000,000. Spencer D. Schuyler, head of the New York office of the Maxim Powder and Torpedo Company, and E. M. Dickerson, a wealthy lawyer and amateur photographer, are the backers of the company.

By the new process either instantaneous or timed exposures, absolutely perfect in detail and tint, can be taken. The finished photograph looks like an ordinary piece of work marvellously colored by hand; but so simple is the process, and yet so accurate, that it becomes merely mechanical. It is said that experiments are being made which, it is expected, will result in transfering the art to printing. It will be only a question of time when a photograph can be taken and then printed from a half-tone plate on the specially prepared paper so that all the original colors will show up to true life.

Mr. Schuyler explains the new process as follows: "It requires a specially ruled screen and specially ruled paper. A multicolored screen, ruled by very fine lines formed of dots and small particles, is employed. Fundamental colors of the spectrum are preferably used for these lines, say orange-red, a yellowish-green, and a violet-blue.

"The screen is ruled with lines in these colors, about three hundred to the inch. This screen is placed in front of and in close contact with an orthochromatic plate, which is then exposed in the camera to the object to be photographed. The ordinary black and white negative is thus obtained in lines corresponding to the screen in register.

"From this negative a positive is made in the ordinary way on glass or paper. If now the screen, or a similarly ruled one, be laid on the positive and moved until the positive and screen are in register, the picture comes up in original colors.

"Nothing could be simpler. It is only nature's method of shading the rose its delicate pink and the sky its transparent blue. None of the complicated apparatus of cruder methods that have failed are needed—no adjusting of lights, no manipulation of colors.

"It is wonderful, wonderful," said Mr. Schuyler. "Half a century of patient experiment has at last come to something. Photographs absolutely true to nature can be made without expensive treatment, and in any quantity. It will revolutionize the art of photography, and allow its use in hundreds of ways now impracticable.

"The paper screens are for positives, the glass ones for transparencies. So fine are the color lines on them, and so perfectly proportioned in shade, that they show white when printed, just as the combined colors of the spectrum are white when properly mixed.

"Of course color photography is just in its beginning. Much is yet to be done. But are results are proof of what can be attained. Even now we have taken 500 colored photographs perfect in every detail of tint as well as outline. Anything can be photographed in all its natural colors, with all the delicate tints of life.

"The crowning achievement thus far is a photograph of a Japanese panel. It contains seventeen distinct shades, but the colored photograph brought out every one. Two photographs of the inventor, Mr. McDonough, show perfectly the flesh tints of the face and the exact color of the cravat, to say nothing of all the other little details of his attire.

"The color screens are easily and cheaply prepared. Inexpensive machinery does the delicate ruling required, and as for the paper, it needs no special manufacturing. Orthochromatic plates are only a trifle more expensive than ordinary dry plates. The difference lies in the fact that the common dry plate does not show up colors in their relative values in black and white, which the orthochromatic one does, aided by a specially prepared developer."—*The Southern Architect.*

ANNUAL CONVENTION OF THE TEXAS STATE ASSOCIATION OF ARCHITECTS.

THE annual convention of the Texas State Association of Architects was held in the gentlemen's parlor of the Driskill Hotel at Austin, Tex., Sept. 5, a fair attendance being on hand. The principal business of to day's meeting was the election of the officers for the ensuing two years, which resulted as follows: J. Reily Gordon of San Antonio, President; Burt McDonald of Austin, First-vice President; F. S. Glouer of Houston, Second Vice-President; H. A. Overbeck of Dallas, Secretary, and A. A. Messer of Fort Worth, Treasurer. After the election of officers an adjournment was taken for dinner, and in the afternoon there was a meeting of the executive committee in which numerous questions of the greatest importance was discussed.

The new officers qualified and have entered upon their duties.

ENAMELED BRICK FOR THE SUBWAY.

WHILE the Boston Rapid Transit Commissioners have been making experiments with Keene's cement plastering and Portland cement, to determine whether one of these materials may not be as satisfactory as enameled brick for lining the walls of the Boston Subway, the question has been decided in very short order under similar conditions elsewhere. What is to be known as the Blackwell Tunnel is being constructed in London under the bed of the Thames, connecting the densely populated districts of the city below the Tower. There seems to have been no doubt about what material to use for facing the interior of the tunnel. It will be lined throughout, approaches and all, with white enameled bricks and tiles, and it is proposed to wash it down thoroughly with a hose every morning. There is no reasonable doubt that this is the cleanest, most cheerful, and most enduring finish which can be devised for such constructions, and there is no reason why our Transit Commissioners should longer hesitate in their choice.—*The Brick Builder.*

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.

SETH BABSON, Pres. W. P. MOORE, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

SOUTHERN CALIFORNIA CHAPTER AMERICAN INSTITUTE OF ARCHITECTS, meets first Wednesday of each month at 114 Spring street, Los Angeles, Cal.

OCTAVIUS MORGAN, PRES. A. M. EDELMAN, Vice-Pres.
ARTHUR B. BENTON, Sec't. AUGUST WACKERBARTH, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.

GEO. W. DICKIE, Pres. W. G. CURTIS, Vice-Pres.
OTTO VON GELDERN, Sec. EDWARD T. SCHILD, Treas.

MASTER PLUMBERS' ASSOCIATION, meets every first and third Friday of each month at the Flood Building.

JAS. E. BRITT, Pres. J. L. E. Firman, Sec.

BUILDERS' EXCHANGE, Directors meet first Friday in each month at Mission and New Montgomery.

OSCAR LEWIS, Pres. JAS. A. WILSON, Sec.

MASONS' AND BUILDERS' ASSOCIATION, meet first Friday evening of each month.

ADAM BECK, Pres. M. V. BRADY, Sec.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

MARIA Kip Orphanage with plans, Percy & Hamilton, Architects.

WOOD PULP IN ARCHITECTURE.

IT is claimed that wood fibre decorations do not contract or expand in changeable temperatures, do not warp or twist, and do not crack or peel. Anything that a sculptor can shape in clay or plaster, or that the engraver can put in any material, can be reproduced. The decorations can be taken into a room bare of anything but the studding and rafters, and screwed into position, forming a hard and cheap finish, and a decoration. The ceiling may be formed in panels or otherwise, the coverings enriched or plain, cornices, centerpieces and friezes in convenient working breadths and lengths, and plain and embossed sheets in different thicknesses for the general wall space, with wainscoting skirting boards. No lath or plaster is necessary, the fiberware itself being thick enough, and forming a wall of greater strength and durability than one of plaster, and affording a surface for decoration and color. Imitation of oak, walnut, maple, or cherry is possible, with waincoted and paneled walls and ceilings, in colored, ceramic finished panels of artistic subjects. The embossed panels offer facilities for decoration which no other material outside of carved wood possesses. The architectural revivals of the present day, and the general desire to possess more artistic and refined homes, render necessary a great outlay in interior decorations than formerly. There has been a decided tendency towards the pure Colonial, Renaissance, and Tudor architecture, or what may better be described as the half-timbered or Queen Anne. There is also a decided liking, which is strongly favored by many architects, for the Elizabethan, with its ornate and richly carved decorations.—*Scientific American.*

WALL FABRICKS for interior decoration are beginning to be justly popular in these days, and the manufacturer who places before the public materials novel, artistic and at prices to meet the popular demand is assured beforehand of successful results.—*The National Builder.*

THE TALLEST OFFICE BUILDING EXTANT.

THE St. Paul building, which is being built in New York for Havemeyer, the sugar king, is 306 feet from curb to cornice, and at the time its foundation was laid was designed to be the tallest office building in the Eastern metropolis. Now a syndicate of New Yorkers, according to a correspondent of the New York *Herald*, have decided to erect a building on Park Row, which shall be eighty feet higher than the Havemeyer building, and will be the tallest office structure in the world when finished. It will be 386 feet in height from curb to cornice, and will have a frontage on Park row of 103 feet. The total cost of the building exclusive of the land upon which it is reared will be above $1,000,000. In its construction it does not present many novel points over other tall buildings of a similar type. The building rests upon piles driven through the sand, one to each square of eighteen or twenty inches- The piles are driven down below the water line, cut off and capped, so that they will not rot, and upon this rises the structure of cement, granite and steel which holds the colossus up. Several of the steel beams, the girders, which are used to carry the weight of the outer walls to an interior base, cantilever fashion, weigh some fifty-five tons. That is heavier than an ordinary locomotive. Only modern steel making, with giant trip hammers and monster forges and colossal cranes, could ever turn out such ponderous billets of steel as this.

If this building, with its foundation, could be set in a scale pan, it would balance a thousand locomotives of the ordinary type. Into the scale against it could be put the entire population of the city of Boston, or for that matter the whole population of several States of the West. And as for its height, it will be far higher than the apex of Trinity spire, a full hundred feet above the topmost point of Bunker Hill monument. Its flagstaff will be on a level with the summit of Cheops.

CEMENT AFFECTED BY FREEZING.

IT appears to be ascertained as a fact, based on more than six thousand recorded results, that Portland cement mortar suffers no surface disintegration under any condition of freezing, but that in most cases its strength is reduced, in some cases by as as much as forty per cent. Rosendale cement is disintegrated when exposed to frost while setting, and its cohesion may be entirely destroyed by immersion in water, which becomes frozen around it. Salt water prevents this disintegration to a large extent, but seems to have an injurious effect upon the strength, and the cement below the disintegrated surface is stated to be increased in strength when the Rosendale cement is used. A mixture of a natural rock cement and of Portland cement is found to give very satisfactory results, as its surface does not disintegrate, and its strength is increased by the freezing. Portland cement is injured less proportionately as the precentage of the cement in the samples is reduced. Again, though lime mortar is ruined by alternate thawing and freezing, fairly good results may be looked for in the case of brick masonry when the mortar is kept frozen for some time after laying.—*The Railway Review.*

EXAMINATION FOR DRAUGHTSMEN IN THE SUPERVISING ARCHITECT'S OFFICE.

IN a few days, says the New York *Evening Post*, the Civil Service Commission will advertise an examination for draughtsmen who desire places in the office of the Supervising Architect of the Treasury. This is a new departure and one of more than ordinary moment. Several years ago such an examination was held, and draughtsmen secured through it, but a provision was at one time attached to an appropriation bill authorizing the employment of temporary assistance in the Supervising Architect's office without the formality of examination. Although this provision has not been repeated, the department has continued to act under its permission, and to make the "temporary" help so employed practically permanent.

With the rigid application of the civil cervice system to the Supervising Architect's office, many opportunities for improvement are in sight. After the office acquires a class of well-trained young men, who has demonstrated their ability, they will be sent to supervise the construction of public buildings all over the country. Heretofore those supervising actual construction have usually been appointed from the local districts, and principally upon the recommendation of Congressmen and political workers. Ofter those supervisors had an interest in prolonging the work instead of pushing it to completion in a business-like way, and it has even been alleged that they have in instances been more or less in league with the local plumbers and contractors, to the detriment of the public service.

In the examination for draughtsmen the Civil Service Commission will avail itself of its privilege in cases where a high degree of scientific attainment is desired, of dispensing with that relic of the spoils system known as the apportionment of Federal offices among the States. It will not be deemed necessary to take fifty per cent more architects from Arkansas than from Connecticut, unless the examinations themselves so decree.

When the President returns to Washington, the Civil Service Commission will confer with him in regard to establishing a register of all applicants for positions as laborers in the public service, similar to that which is now kept in the navy yards. It would obviously be difficult to select charwomen and grass-cutters by means of a civil service examination, but this register can be made up by those who desire work and who are endorsed highly by former employers. Other evidences of fitness for manual labor might be gathered, and when vacancies occur they could be filled from the list.

CEMENT.

EXCESS of water in a concrete mixture is bad practice, as only a fixed equivalent of water can chemically combined with cement. The surplus water simply displaces so much of the solid contents of the mass and leaves voids after it has evaporated. This makes the hardened concrete porous so it will obsorb moisture; this is a source of great weakness as the water held in the interstices during frosty weather expands and thus the cement begins to show cracks or other defects.

THE LATEST IN ELEVATORS.

THE new elevators being installed in the Congressional Library building are undergoing severe test. They are built with a special view to safety, and in addition to a safety-catch are provided with what is known as an air-cushion. This cushion, says the Washington *Post*, is not a real cushion, inasmuch as it is not soft, nor is it made and put in position. It is formed only when the elevator is dropped to the bottom of the shaft, and thus all wear and tear on the cushion is avoided. The principle is a very simple one. At the bottom of the shaft there is a well about thirteen feet in depth. The sides of the well are so arranged as to come at the top within a sixteenth of an inch of the side of the elevator. This space gradually grows larger until there is a distance of an inch and a half between the elevator and the shaft. When the elevator is dropped from the roof it pushes before it a quantity of air, and, dropping into the well, the air is rapidly condensed. As it can escape only by passing through the space at the sides, it escapes very slowly, thus allowing the elevator to settle easily.

Several tests have been made, and in each case the appliances worked in a most satisfactory manner. First, the elevator was taken to the top of the shaft, and on the floor was set a basket of eggs. Everything was then cut loose and the car dropped on the cushion, a distance of about eighty feet. The noise could be heard all over the building, yet the jar was so slight that not an egg was broken, or even cracked. In the next test the elevator was loaded with 2,600 pounds of iron and dropped in a similar manner. It was equally satisfactory.

The lives of the passengers are not dependent on this air cushion, as the safety-catches are of the latest and most improved pattern, but in case they should fail to work the passengers would receive nothing beyond a scare. The cushion would save them from bodily injury.—*The Southern Architect.*

THE DESTRUCTION OF WHITE PINE.

REPORTS from Minnesota state that with the present rate of destruction the days of the white pine are numbered. No other wood equals white pine in value and variety of purposes for which it is used, and its extinction would be a serious loss to the country. It has been and and still is the chief material in wooden buildings all over the country, and lumbermen have attacked the great pine forests as if the supply were inexhaustible until its early disappearance is manifest. Estimates just compiled by the State Forest Warden of Minnesota, an office created by the last Legislature because of the opinion that the rich forests were being too rapidly depleted, show that there are in Minnesota 10,890,000 acres of forest land, and that on this there stand, in addition to other woods, 19,000,000,000 feet of live white and Norway pine and spruce, of which the white pine aggregates 14,500,000,000 feet. This is a vast total, but it is being cut down at the rate of about 1,200,000,000 feet a year, besides fearful losses by fires, and the supply will hardly last more than a dozen years. It would not last so long as this were it not for the fact that the fire-swept pine can be saved by cutting when it is so located that it can be reached by railroads or water in time to save it from the attacks of worms. There is, too, a constant growth of the green timber, estimated at not far from 1¼ per cent a year, which will have some effect in warding off the final axe cuts. But in from ten to fifteen years the last white pine forests in the United States will have disappeared, for pine does not succeed as second growth timber, or at least has not done so with all the experiments carried on in the old pineries of Michigan and other States.—*Architecture and Building.*

BOOKS AND PERIODICALS.

OUR DUMB ANIMALS—It always gives us pleasure to open the envelope of this charming paper for we are always rewarded by finding something good from the pen of Geo. T. Angell. Mr. Angell is a man of very decided convictions, and what is more is not afraid to make them public in his remarks about the remedy for present hard times he writes: "We do not pretend to understand much more about finance than the cobbler whom the old Dutch Governor of New York, Peter Sturvysant, found haranguing a crowd in a public street, and told that if he ever caught him again prating of things he knew nothing about he would tan his hide for drum heads that he might hereafter make noise to some purpose." He then goes on to give his rather radical idea of reform, doubtless he would have been arrested in this city for disturbing the peace if he had expressed his honest opinion here.

THE SOUTHERN ARCHITECT, the representative of Southern Architecture, published at Atlanta, Ga., comes to hand in a new and handsome cover; the September number has an interesting table of contents; "The Strength of Georgia Pine" and "The New Steel Arch at Niagara" are both articles of interest to the architect and engineer.

LIPPINCOTT'S Magazine for September contains among other interesting articles a complete novel "A Marital Liability" by Elizabeth Phipps Train. This magazine always welcome to our table contains much that will be pleasing to the general reader.

NOTES AND COMMENTS

That gigantic piece of engineering, the Blackwall tunnel, attracts as many visitors as some places of entertainment. Under the auspices of the London Reform union, a further band of citizens, numbering about a hundred, inspected the progress of the tunnel under the guidance of Mr. McDougall, L. C. C., and Mr. Hay, one of the engineers in charge, on behalf of the County Council. The visitors were first shown on the surface the remaining two hundred yards that still has to be tunnelled. A descent of the Blackwell caisson was then made, Mr. Hay describing the action of the air-locks, by which the compressed air is kept in the boring chambers. To the accompaniment of dim lights and slippery planks the journey was then made on foot to the Greenwich end, which is approaching completion.

THE DAILY PAPERS have taken up the crusade agains the filthy condition of our public buildings and places—opened by us a few months ago.

GATEWAY, CYPRESS LAWN CEMETERY.
McDOUGALL & SON, ARCHITECTS.

THE STRENGTH OF COMMON MORTAR.

HERR BESCHETZNICK, an Hungarian expert, has been investigating common mortars, feeling that too much attention had been devoted to the higher cements by scientific men in all countries. He tried various kinds of lime, and slaked them all under the same conditions, afterwards allowing them to mature for a week. Mixtures of lime thus treated and ordinary building sand with water were then prepared, and tested after they had been allowed to set for one, three and twelve months.

The result of the tests showed that poor limes set more quickly than fat limes, but that the streugth of the latter was relatively greater when the mixtures used were poor in lime. Thus, 1:5mixtures of fat lime had nearly the same strength as 1:4 mixtures of poor lime.

An American, A. S. Cooper, has also been investigating the question of mortars turning his attention to the influence of the character of the same upon them. He used sands of varying fineness and character of grain, and after numerous experiments arrived a1 the following conclusions, namely:

1. Other things being equal, a fairly coarse sand, for example, one passing through a 12-inch sieve (12 wires to the mesh), and caught on a 16-inch sieve, gives mortars of higher tensel strength than do finer sands.

2. This effects of size of grain disnppears with sands fine enough to pass a 40-mesh sieve and caught in a 60-mesh sieve. Sands finer than this give similar results.

3. The character of rhe service of the grains is of no moment. Mere sharpness of grain is not the only point to be considered, for an extremely sharp sand may have a smooth surface on each facet, and a moderately rough surface is preferable.

All the above results, namely, those of Beschetznick and of Cooper, are of direct practical value, and should be made use of by those who have to use mortar, and are desirous of employing only a thoroughly trustworthy mortar, which will stand the test of time.

It is certainly high time that the composition of the various cementitious materials used in building should be defined, and that the strengths of such materials of known composition should be ascertained, so that nothing should be left to mere chance, or to the intelligent discretion of those talented assistants to whom we alluded in our opening paragraph.—*British Brickbuilder.*

BUSINESS MOSAICS.

A new depot for the sale of Cabot's Creosote Shingle Stains, Sheathing Quilt, Mortar Colors and Brick Preservative has been opened in San Francisco at 640 Mission street. This depot will be in charge of Mr. Charles J. Waterhouse, well known to architects as the representative of Burrowes' screens. All the above mentioned materials will be carried in stock, ready for immediate shipment, and samples, prices, estimates, etc , will be gladly furnished on request.

All architects who are interested in procuring an artistic and durable shingle stain which will prevent the blackening of redwood; or a superior insulator and deafener for walls and floors; durable and economical mortar colors, or a thorough waterproofing for brickwork, will do well to communicate with Mr. Waterhouse.

"George says there's bound to be bolting in the convention." "Yes; I suppose that's to hold the planks in the platform."—*Chicago Record.*

Hobart B. Ives & Co., New Haven, Conn., have lately constructed a new sash lock in stamped steel, bronze and brass on all finishes, which far outstrips any production in this line. See their new advertisement in this paper, one has only to glance upon this improved sash lock to be convinced it is all that is needed for a perfectly safe and reliable sash lock—their catalogue will be forwarded upon application.

"You have an immense amount of hay," observed the visitor at the Clover Meadow Farm. "Ya-as," said Farmer Redneck; "but there ain't a dang thing t' feed it to but bicycles."—*Jocker.*

Dixon's Graphitoleo is a preparation of a very finely pulverized and very choice graphite and a pure petrolatum warranted not to gum or become rancid. The merits and wonderful lubricating power of Dixon's flake graphite are well known to almost every engineer and machinist throughout the world. It has been tested by professors at the leading mechanical institutes, and also by the mechanical experts of the great railroad companies throughout the country, and declared to be the finest and best natural lubricant known. An article combining a perfect lubricant and rust preventive, put up in convenient form, is something desired by every bicyclist, hunter and yatchmen, as well as by every office and household.

To all such and many others Dixon's Graphitoleo will be not only welcome, but indispensable. It is manufactured only by the Jos. Dixon Crucible Co., Jersey City, N. J.

"What point does O'Beeze raise against Mrs. O'Beeze's riding a bicycle?" "Embonpoint,"—*Town Topics.*

At the Fair of the American Institute now in successful operation a fine display, near the entrance, of cordage, attracts universal admiration and reminds us to call attention to an advertisement on the last page of this journal of Samson Cordage Works, Boston, Mass. Samson Spot Cord s warranted free from waste and imperfections.

If we look backwards to the year 1828 and reflect upon the changes in the manner of doing business in this country now and then, when there was no express, no matches, no railroad cars, no telegraph, no electric light, etc., yet this is the year that The J. L. Mott Iron Works were founded; who now produce that marvel in the plumbing world, the Imperial Porcelain Roll Rim Bath Tub, we shall doubtless count this as among the great triumphs of the age. Mr. M. S. James, Flood Building, room 27, represents this company on the Pacific Coast.

Roxy—What are you buying up all that brown wrapping papper for? FOXY—Oh, like to look over a paper once in while that isn't full of politics.—*New York Press.*

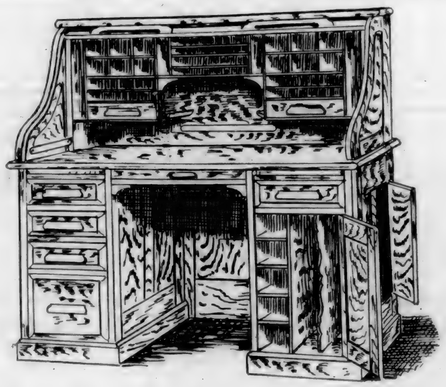
Joseph Budde, 575 Mission street, San Francisco, manufacturer of sanitary appliances in the plumbing line, is so well established in the estimation of architects, contractors and householders, that were it not for the purpose of calling attention to the importance of sustaining home industry it might appear needless to call attention to his stock in this line, the fact of medals and diplomas being awarded at the State Fair, show the estimation which competent committees who have carefully examined into the subject regard him, speak for itself.

The ideal wall finish is a perfectly flat finish prepared ready for use. Contains no glue is non-absorptive and antiseptic, will not crack or peal off. Can be washed when soiled with soap and water.

Zinolith is the trade mark, Manufactured by L. H. Butcher & Co., 593-595 Mission street, San Francisco.

Miss Gosippe—Do you pay much attention to what your husband says? MRS. JEALOUS—Not unless he talks in his sleep.—*Omaha Bee.*

San Francisco Furniture Mnfg. Co., late of Chicago, Ill., is managed by Mr. Charles J. Bruschke. This is the



place to get good oak furniture and oak flooring all of California Oak, 644-648 Bryant street, San Francisco.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

WHO ARE CONTRACTORS?—That a building is erected under the supervision of the owner, except as to the painting and the plumbing, for which he made contracts, does not make the person with whome he made the contract for the plumbing a subcontractor, in that the owner himself was the contractor, so as to prevent a mechanic's lien from being filed for the plumbing materials furnished the person who did that portion of the work. Owen v. Johnson, Supreme Ct. Penna, 34 Atlantic Reporter, 549.

ARCHITECT HAS A LIEN FOR PLANS USED.—An architect says the Supreme Court of Iowa, who prepared plans and specifications for improvements on a building, which are made in accordance with such plans, is entitled to a mechanic's lien on the property.
Parsons v. Brown, 66 Northwestern Reporter 880.

LIABILITY OF OWNER FOR DANGEROUS BUILDING.—The Supreme Court of Nebraska holds that the owner of real property, in exercising his own tastes and inclinations as to the character of a building he will erect upon it, has no right to build and maintain a structure which, by reason of defects or inherent weakness either in material or construction, is liable to fall and do injury to an adjoining owner or the public. He is liable for the natural, probable, reasonable and proximate consequences of his acts only, and it is for the jury to determine whether any of these caused the injury.
Kitchen v. Carter, 66 Northwestern Reporter, 854.

ARCHITECT'S CERTIFICATE OF PERFORMANCE.—Where the architect refuses a material-man a certificate that he has performed his contract with the contractor for the material, on the ground that it was unnecessary, he having certified to the owner that the contractor has performed his contract, such refusal is unreasonable, and dispenses with its necessity on the part of the material man to secure such certificate, as required by his contract to enable him to recover from the contractor. Murdock v. Jones, Sup. Ct. App. Div. 38 N. Y. S. Rep. 461.

CONTRACT WITH LESSEE OF PREMISES.—Evidence that the alteration on the premises, made on the order of the lessee, for which the lien was claimed, consisted merely of the erection of a wooden partition in one of the rooms, does not authorize a finding that the work was part of the original structure, so as to dispense with notice to the owner, as required by the laws of Pennsylvania, in case of repairs, alterations or additions, in order to bind the premises. Hall v. Blackburn, Supreme Ct. Penna., 34 Atlantic Rep. 19.

CITY BUILDING NEWS.

Sixteenth Ave. near N. street. Cottage; owner, Peter Murphy; architect, H. R. Schmuckert; contractor, M. J. Scott; signed, Aug. 24; filed, Aug. 25; cost $1150.

Sutter and Hyde. Painting, etc., six-story brick; owner, Dr. J. Rosenstirn; architects, Saifield & Kohlberg; contractor, D. Zelinsky; signed, July 5; filed, Sept. 3; cost $3100. Blostering, etc.; contractor, J. J. Kelley; signed, July 4; filed, July 14; cos; $4278.

Sutter near Steiner. To build; owner, John Bernva; architect, C. M. Rosseau; contractor, R. J. Pavert; signed, Aug. 12; filed, Aug. 13; cost $8000.

Twenty-third and Nebraska. Alterations, etc.; contractor, McInerry; cost $1000.

Twenty-fourth and Treat Ave. To build; owner, J. H. Mangels; architect, H. Gelifuss; contractor, F. W. Kern; signed, Aug. 28; filed, Tept. 1; cost $7000.

Twenty-fourth and Shotwell. To build; owner, John F. Schomer; architects, Martens & Coffey; contractor, J. Bucher; signed, Sept. 3; filed, Sept. 4; cost $4735.

Van Ness Ave. and Clay. Retaining walls, etc.; owner, Claus Spreckels; architects, Reid Bros.; contractor, McPhee Co; signed, July 30; filed, Aug. 15; cost $14,875.

Valencia near 23d. To build; owner, H. J. Tilden; contractor, W. H. Bagge; signed, Aug. 14; filed, Aug. 18; cost $1615.

Vallejo near Montgomery. Block of two-story frames; owner, Annie L. Whittell; architects, Townsend & Wyneken; contractors, W. T. Veitch & Bros; signed, Aug. 15; filed, Aug. 18; cost $15,445.

Vallejo near Myntgomery. Plumbing and gas-fitting; owner, Annie L. Whittell architects, Townsend & Wyneken; contractor, R. Rice; signed, Aug. 17; filed, Aug. 18; cost $1600.

Vermont and 25th. To build; owner and builder, F. Nelson; cost $3000.

Williamson, Park Ave. Cottage; contractor, W. Helbing; cost $1800.

York and 25th. To build; owner, G. E. Buck; architects, Herman & Swain; contractor, L. B. Schmid; signed, Aug. 24; filed, Aug. 24; cost $2700.

Alvarado near Douglass. Cottage; owner, Jacob Welsbeir; builders, Cotter & Jones; cost $2400.

Baker near Washington. Two-story frame; owners, W. E. Lutz and wife; architect, B. J. Cahill; contractor, W. J. Field; signed, Aug. 15; filed, Aug. 15; cost $3770.

Broderick and Eddy. Cottage; owner and builder, H. Keenan; cost $3600.

Bryant and Converse. Repairs; owner, J. C. Donahoe; day's work; cost $1000.

Brannan near Fifth. Marble work on church; contractors, Pierce & Carter; cost $1600.

Buchanan near Jackson. Additions and alterations; owner, F. V. Acker; cost $1800.

Buchanan near Lombard. Moving and raising; owner, John Hurson; architect, A. R. Wilkins; contractor, S. Uray; signed, Aug. 17; filed, Aug. 29; cost $1153.

Bush near Franklin. Alterations and additions; owner, Jean Maloeg; architect, Jules Godart; contractors, Medus & Hurthore; signed, Aug. 27; filed, Aug. 31; cost $2400.

California near 1st Ave. Cottage; owner, Clara and Markey Weiss; contractor, L. G. Bergren; signed, Aug. 28; filed, Sept. 3; cost $1100.

California near Lyon. Two-story frame; owner, Rosa Arnheim; architect, M. J. Lyon; contractors, Elder & McLaughlin; signed, Aug. 11; filed, Aug. 13; cost $4085.

Castro near 23d. Two-story frame; owner and builder, S. A. Born; cost $2200.

Chestnut near Larkin. Cottage; owner, Mrs. Mary Comming; architects, Pisses & Moore; contractors, F. Miller and P. Fredriksen; signed, Aug. 25; filed, Aug. 29; cost $2915.

Congo near Circular Ave. Cottage; owner, G. A. Fabris; contractor, J. D. Moreland; cost $1000.

Clay and Cherry. Two-story frame; owner, T. P. Hicks; architect, W. Rossand; contractor, C. Anderson; signed, Aug. 24; filed, Aug. 25; cost $3985.

Clay and Webster. Addition to college; owner, Cooper Medical College; architects, Wright & Sanders; contractors, Peacock & Butcher; signed, Sept. 1; filed, Sept. 2; cost $4640.

Clement street and 6th Ave. To build; owner, Mrs. Mary Gilroy; architect, M. G. Bugbee; contractor, A. C. Soule; signed, Aug. 21; filed, Aug. 26; cost $2900.

Croce, Academy tract, near Mission. Cottage; owner and builder, A. G. Anderson; cost $1000.

Douglass near 17th. Cottage; owner, H. Peters; architect, Emil John; contractor, Wm. Tegeler; signed, Aug. 29; filed, Sept. 3; cost $2674.

Eighth Ave. near J. Cottage; owners, Chas. and Ida M. Osborn; contractor, D. McLeod; signed, Sept. 2; filed, Sept. 4; cost $1315.

Fell and Clayton. Concrete, etc., two-story frame; owner, M. A. Moldenhouer; contractor, H. P. Conrady; signed, Aug. 22; filed, Aug. 22; cost $6300.

Fulton and Gough. To build; owner, Louis Schoenfeld; architect, Emil John; contractor, C. Kreeker; signed, Aug. 24; filed, Sept. 1; cost $3340.

Fifth near Stevenson. Concrete work, etc., for five-story brick; owner, John F. Boyde; architects, McDougall Bros; contractors, Warren & Malley; signed, Sept. 3; filed, Sept. 3; cost $1925.

Fifth near Stevenson. Brick work for five-story brick; owner, John F. Boyd; architect, McDougall Bros; contractor, Thos. Butler; signed, Sept. 4; filed, Sept. 5; cost $1160.

Fifteenth near Mission. Alterations and additions; owner, W. M. Currie; architects, McDougall Bros; contractor, M. C. Brennan & Son; signed, Aug. 20; filed, Aug. 20; cost $1600.

Fourth Ave. near Lake. To build; owner, W. F. Parks; contractor, W. W. Rednall; signed, Sept. 3; filed, Sept. 7; cost $1500.

Fourth Ave. near Lake. Cottage; owner, G. B. Lagomarsino; contractor, D. Martino; cost $1000.

Fourteenth near Presidio. Cottage; owner, Mrs. Annie Dixon; contractors, Waste & Fenn; cost $1800.

Folsom near 18th. To build; owner, Henry Meyn; architect, W. H. Wharff; contractors, Holm & Sheibley; signed, Aug. 15; filed, Aug. 18; cost $2466.

Folsom near 18th. Grading, concrete, etc; owner, Henry Meyn; architect, W. H. Wharff; contractor, Robert Bugot; cost $344. Plumbing, gasfitting, etc; contractors, Bertram Bros; cost $500.

Franklin near Washington. Two-story frame; owner, J. D. Bailey; architect, F. B. Wood; contractors, Brutcher & Griffith; signed, Aug. 12; filed, Aug. 13; cost $3973.

Franklin and Clay. Additions; owner, Gordon Blanding; architects, Kenitzer & Barth; superintendents, Mahoney Bros; cost $10,000. day's work.

Fremont near Howard. Two-story brick; owner, C. H. Evans; architects, Percy & Hamilton; contractor, R. Ringrose; signed, Aug. 13; filed, Aug. 14; cost $4947.

Genesee and Joost Ave. Two-story frame; owner, John Wilson; cost $2200.

Golden Gate Ave. near Baker. Cottage; owner and builder; S. A. Born; cost $2600.

Golden Gate Park. Granite bridge; owner, Park Commissioners; contractor, A. McLennan; cost $16,000.

Green and Franklin. To build; owner, Mr. Cademantori, contractor, P. Demartini; cost $1600.

Hampshire and 18th. One-story brick; owner, Viking Brewery Co.; mason work, Riley & Loane; carpentry, I. Schuler; cost $2000.

Harper near 30th. Cottage; owner, Joseph L. Konrad; contractor, Henry Behrens; signed, Aug. 14; filed, Aug. 19; cost $1550.

Hayes near Lyon. To build; owner, Sarah Snow; architect, J. G. Hult; contractor, S. T. Crawford; signed, Aug. 19; filed, Aug. 21; cost $3222.

Haight near Laguna. Roof for orphan asylum; owners, Mesdames Alvord & Garniss, trustees; contractors, Pacific Sheet and Metal Works; cost $3223.

Joost near Circular Ave. Cottage; owner, M. O'Connor; contractors, Miller Bros.; cost $1500.

Lombard near Kearny. Cottage; owner, Frank Browell; architects, Towsend & Wyneken; contractor, P. A. Antonelli; signed, Aug. 19; filed, Aug. 19; cost $1275.

Market and Fell. Repairs to Fairmont Hotel; owner, Maria C. De Laveaga; cost $2000.

Mason near Post. Alterations; contractor, W. Little; cost $1500.

Mission near 8th; Two-story brick; owner, Edward McLaughlin; architect, Chas. Geddes; contractor, D. B. Munroe; signed, Aug. 14; filed, Aug. 21; cost $2670.50.

Mission near 8th. Iron anchors, etc.; owner, Edward McLaughlin; architect, Chas. Geddes; contractor, Henry Ralston; signed, Aug. 14; filed, Aug. 29; cost $1217.

Mission near 8th. Grading and brick work; owner, E. McLaughlin; architect, Chas. Geddes; contractor, H. H. Larsen; signed, Aug. 14; filed, Aug. 15; cost $5833.

Mission near 3d. Alterations and repairs; owner, Shiels Estate; contractor, W. Little; cost $2500.

Mission near 14th. To build except plumbing; owner, Patrick Riordan; architect, Jas. P. Brady; contractor, John Quinn; signed, Aug. 10; filed, Aug. 11; cost $2505.

Mississippi near 19th. To build; owner, G. O. F. Hans; contractor, A. Dahlberg; signed, Aug. 17; filed, Aug. 17; cost $1930.

O'Farrell near Powell. Alteration and addition; owners, Geo. D. and Mary A. Tay; architects, Herman & Swain; contractor, J. G. Adams; signed, Aug. 13; filed, Aug. 13; cost $6324.

O'Farrell and Hollis. To build; owner, E. F. Bareilles; architect, J. Godart; contractor, A. Hawkins; signed, Sept. 2; filed, Sept. 3; cost $8500.

O'Farrell and Hollis. Brick and iron work; owner, E. and F. Bareilles; architect, J. Godart; contractor, John McCarty; signed, Sept. 1; filed, Sept. 3; cost $1300.

Page and Webster. Brick and stone work; owner, M. Greenwood; architect, Chas. Geddes; contractor, H. H. Larsen; signed, July 22; filed, Aug. 15; cost $2100.

Page near Buchanan. To build; owner, John B. Davitt; architect, J. W. Haubrick; contractor, John Miron; signed, June 17; filed, Aug. 18; cost $2700.

Page near Cole. To build; owner, Edward Barnett; architect, C. T. McNally; contractor, John Hood; signed, Aug. 10; filed, Aug. 21; cost $3600.

Post near Kearny. Alterations and additions; owner, Eva R. Barron, ex-estate of E. Barron; architect, R. H. Whtte; contractor, Ingerson & Gore; signed, Aug. 11; filed, Aug. 14; cost $4025.

Post near Powell. Two fire-proof vaults; owner, San Francisco Gas Light Co.; architect, Clinton Day; contractor, Diebold Safe Co.; signed, July 25; filed, Aug. 22; cost $3625.

Point Lobos Ave. near Boyce. Two two-story frame; owner, E. P. Troy; builder, T. A. Born; cost $5000.

Powell and Ellis. Ventilators, etc, for four-story brick; owner, Royal Eagle Distilleries Co.; architects, De Prosse & Meussdorffer; contractor, C. Schutt; signed, Aug. 19; filed, Aug. 22; cost $2285.

Powell and Market. Alterations; owner, E. J. Baldwin; architect, M. J. Lyon; contractor, W. Knowles; signed, Aug. 25; filed, Aug. 25; cost $3000. Copper, iron and brass work; contractor, P. E. Banker; cost $868. Painting, etc; contractor, L. Aron; cost $775.

Pierce and Lombard. Raising and moving; owner, D. Samuels; contractor, Geo. Reichley; cost $2250.

Sacramento near Fillmore. To build; owner, Agnes Holt; contractor, R. R. Redall; signed, Aug. 11; filed, Aug. 12; cost $1035.

Sacramento near Van Ness. Alterations and addittons; owner, J. Z. Passadas; architects, Pissis & Moore; contractor, F. W. Kern; signed, Aug. 12; filed, Aug. 13; cost $1385.

Sacramento near Van Ness. Stone work; owner, Claus Spreckles; architects, Reid Bros; contractor, J. D. McGilvray; signed, July 30; filed, Aug. 15; cost $11,000.

Sacramento near Drumm. Brick building; owner, Capitol Rolling Mills; pile driving, San Francisco Bridge Co.; mason work, Geo. Richardson; cost $25,000.

Sharron near 16th. To build; owners, Geo. and Katherina Stockmier; contractor, R. Trost; signed, Aug. 11; filed, Aug. 11; cost $1835.

St. Marys Ave. and Marsily. Cottage; owner, B. Smith; architect, H. E. Harris; contractor, J. Millerick; cost $800.

St. Marys Ave. near Mission. Cottage; owner, M. E. Haskell; contractor, L. G. Bergren; cost $900.

NOW IN THE SEVENTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

PREMISES OF NEW SAN FRANCISCO POST-OFFICE, AUTHORIZED BY ACT OF CONGRESS, MARCH, 1887.

EXISTING POST-OFFICE BUILDING AT SAN FRANCISCO, CALIFORNIA.

THE MERCHANTS' Association of San Francisco has taken up the question of regulating the mixing of mortar for building purposes on the public street, in order to protect themselves from the nuisances created by the present methods of procedure, and will make an effort to have a suitable ordinance passed by the Board of Supervisors; the San Francisco Chapter of Architects and the Builders' Exchange have been requested to render advice and assistance in framing the provisions of the proposed ordinance, so as to best serve all the conflicting interests. The architects present at the last Chapter meeting were of the opinion that it would be advisable to recommend the method employed in many European cities, of establishing a business devoted exclusively to the mixing and sale of mortar. A convenient and central location could be chosen where orders could be received and filled, and mortar delivered when and where required and in quantities to suit purchasers.

Such a system, properly organized, would render the

obstructing of the streets with piles of mortar unnecessary, prove more economical, and render more satisfactory and uniform results in regard to the quality of the mortar used.

The specialization of each different branch of industry is the tendency of the age, and whether or not the Merchant's Association succeed in their present purpose, it will not be long before the economic side of the question will force a solution, irrespective of the question of public convenience.

MONEY being the subject now uppermost in all minds it becomes us to take cognisance of it, being a matter which effects all industries, the building interests included.

It is a subject clouded over with sophistries; and yet, when denuded of all these, which have been laid over by the hands of parties interested in obstructing the common sense view of the matter, we find t simple enough.

The Law called the Law of Supply and Demand, universally recognized, teaches us that the more of a necessary article there is the cheaper it is, and the scarcer it is, the more expensive it is. Money being a necessity the more of it there is the cheaper it is. So that when it is doubled in volume it becomes about double as cheap. So when the unlimited coinage of silver is allowed, the volume of money being increased about double, the man that has the money will have to pay about double for what the producer has to sell him. It is therefore narrowed down to a struggle between those who have the metals of which money is chiefly now made and those who have them not, to make dear whatever each has to sell.

The man that wants to build and has to borrow money to do so, therefore will naturally vote for the unlimited coinage of silver—he who has money to loan as naturally votes for keeping only gold in use—the mechanic and laborer, who have the products of their labor to sell only, vote for silver as they will then get more for their labor—the capitalist that employs labor of course he wants to cheapen it and make scarce to others the material in which he pays for it and which he holds.

The statistics of the Stone industry given in another part of our journal show the continuous decline of that industry for many years, some claim due to Free Trade others to protection—the fact is, it is due to the want of money in the pockets of the consumers. Stone, marble and all such present luxuries would be used commonly if the people had the wherewithal to indulge.

However this Silver medicine must not be considered a cure all, it is simply the stimulant that is given to a wounded man to keep him together until proper aid can be given him, while the mines are in the hands of private parties instead of in the hands of the State the major portion of the profit on coinage of money will go into the mine owners' hands: while the machinery is not accessible to the community the great mass of the profits of manufacturing will go into the hands of the capitalist manufacturers—and while the land is mortgaged almost all the profits of farming goes into the hands of money holders. That's what we mean when we say that an increase of the currency alone is simply a stimulant or palliative to prepare the social body for the operation which must come later—when we get the blood circulating to all parts of the numbed extremities by that flood of silver which the gold advocates predict, then is the time to talk abont that anti-monopolistic surgical operation that shall make well the body politic.

Whether the architectural and building interests would be temporarily benefited by that bounteous down-pour of sparkling silver rain which would cause money to be cheaper or whether the attempted flood would cause the financial panic and resulting disasters that other prophets predict, can only be ascertained by an actual trial of the proposed experiment.

HOUSING OF PEOPLE OF SMALL INCOMES.

No. 3.

WE CONTINUE on the subject of "Expropriation for Sanitary Purposes" and the provisions of the English Law of 1890 in regard to the same.

As the author of the Report of the Commissioner of Labor says:

"One of the great merits of this law is that it provides for the acquisition of slum property without having to pay unreasonable sums for it. Inability to do this greatly hampered the operation of the previous artisans' and laborers' dwellings act."

"Conditions as to rentals charged may be incorporated, otherwise the people are at the mercy of speculative builders. Furthermore, the community will find that, if buildings are built by speculative builders upon land expropriated for sanitary purposes by the city, the community has not been a gainer in the end, for the reason that surrounding localities become overcrowded, and very soon another pest spot is created even worse than the one which was displaced. It is seriously open to question whether or not the municipality must not, in the interests of justice, here intervene. Certainly it must restrict rents and guarantee sanitary features.

The municipality is justified in building on the ground thus acquired, because the benefits of the expropriation are preserved to the taxpayers, and evils incident to the overcrowding and the upgrowth of slums are prevented.
